A WINTER VISTA

The Flexible Movement of the Spade in Plowing

When you drive a spade into hard ground, you sort of "wiggle" it around between each push. It seems to go down easier—you remove the resistance of clinging soil.

It is this principle that we have succeeded in getting into Janesville Plows. Our object was to lessen the pull on your team and turn a neater furrow. The S. & S. auger twist mouldboard glides through the soil with a flexible movement. This flexibility is possible only in a single bail plow like the Janesville. The plow bottoms have just enough movement in the frame to ease the *pinch* at the point of the share and its cutting edge. This takes the hard work out of plowing. The furrows shave off clean—the finished field shows a skilful job.

JANESVILLE PLOWS

Manufacturers of Farm Implements

With S. & S. Auger Twist Mouldboards

were used by the winners in the plowing matches at Big Rock, Wheatland and Grant Park, Ill., in 1914 and 1915. Their winning in these matches proves the quality of work they can do on your fields. They left the depth and width of the furrows uniform—buried all trash and stubble, broke up the ground thoroughly—left the surface smooth and clean. You can adjust Janesville Gang Plows to 12, 13 or 14 inch furrows.

Why not do your spring and fall plowing this year with the Janesville flexible S. & S. bottom? Save your team—why pull a plow bottom set solid in the frame? Get the spade movement into your plowing and sidestep hard work.

65 Elm St., Quincy, Ill.

CURRENT EVENTS

THE British cabinet has decided on conscription as the only available means by which to get the men necessary to carry on the war against Germany and Austria. A conscription bill will be recommended by the cabinet and every effort will be made to push it through parliament at an early date. It is argued that the war will be won, in the long run, by the nation which has the best available man supply, and, while the upper and the lower classes in England are enlisting in satisfactory number, the great middle class has not rallied to the support of the government as it should. Hence the bill which, if finally passed, will take men from all walks of life for military service, single men first and the married ones later on, as they are needed. In the meantime, actual fighting in the field has been delayed somewhat by the rigors of winter, so that little progress has been made by either side. The danger of the Teutons advancing into Greek territory and attacking the allied troops at Saloniki now seems remote, as nothing of the sort has been attempted, although frequently rumored. Seventy-five thousand Serbs have been reformed at Scutari and Eloasan and in Albania and the Montenegrin army, which heretofore has been debarred geographically from taking any large part in the war, is now throwing itself energetically into the contest against the Austrians.

COMPULSORY military service in the United States, compelling every able-bodied man to bear arms, is forecasted by the recommendations of the secretary of war, who maintains that for proper "preparedness" the United States must forsake the paths of peace and follow in the footsteps of the military nations of Europe. The war department will urge upon congress the proposition that it is vital that a definite statement of military policy for the United States be put through at this session, and that machinery be created for the organization of a citizen army, volunteers to begin with, but based on universal military service. It was learned last week that the administration's continental army plan is designed to operate with either the volunteer or the universal service system. It is known that the continental army plan is regarded in its present form by its framers as a preparatory measure, paving the way to a decision by the people at large for or against universal military service. In determining his plan Secretary Garrison is known to have consulted every general officer of the active army and many officers of lower rank. The virtually unanimous opinion of the commissioned personnel of the army, as well as the civil officials of the war department, is said to be that adequate preparedness can only be secured on the basis of universal service. That the recommendations will precipitate a big fight is a foregone conclusion, as they are diametrically opposed to every American principle and precept.

SERIOUS splits in the Ford peace party abroad have jeopardized any hopes of success that may have been entertained when the expedition sailed from the United States some three weeks ago. Because of a nervous breakdown, the leader, Henry Ford, was obliged to leave the party early, returning to the United States. Hardly had he left the ship before his followers started quarreling among themselves, over the manner in which the peace overtures to the warring nations were to be made, over the question of authority and so on. One of the prominent women members, a suffrage leader, left the ship soon after Mr. Ford, issuing a public statement in which she said: "An organization was not formed until three days before the end of the voyage. To that fact I trace all misunderstandings, dissensions, mistakes in policy, inefficiency and inability to get the idea of a mediating peace congress in comprehensive shape before the public. The organization, when finally formed, was abortive. The Scandinavian public, who expected clear thinking and a definite program, were skeptical about the serious-mindedness of the delegates. At the meetings the discussions have been purely private, with the result of ill-feeling, suspicion and condemnation." The plan was unquestionably a sincere and well-meant effort on the part of Mr. Ford to get the men out of the trenches by Christmas or soon thereafter, but little or nothing has been accomplished, on the face at least. A committee of seven is to be appointed to go to The Hague later and do what it can for peace, with what results remains to be seen.

THE British press, which in the early stages of the war supported the national administration without dissension, is now engaged in paying its respects in no uncertain tones to those in authority and to alleging slowness, improvidence, indecision and bungling in some of the most important campaigns in which England has participated. The newspapers generally hold Premier Asquith responsible for the conduct of affairs, David Lloyd George being the only one universally praised and commended for promotion. The two latest counts of the indictment of the cabinet are the postponement until after the holidays of the munitions bill and the postponement of giving the country any insight into Lord Derby's report on his recruiting results. In the meantime the verdict of union labor on Mr. George's appeal to relax union rules in munitions works to permit of the entry of 80,000 unskilled laborers is awaited with interest. One hundred and fifty delegates of the Engineering Society met in London to consider terms for settling all differences with the government. There is a general feeling throughout England that too much politics is being played and that the men in power are not rising to the emergency and proving their bigness as men in such critical times and situations should.

JUST to what extent the German Humanity League represents the people and the sentiment of the kaiser's land it is impossible here and now to say. It is interesting, to say the least, to note the language of the appeal for peace issued by that organization. Here is a quotation from the document: "Our homes are being desolated in a campaign waged not in lawful defense of German territory but to satisfy the insatiable savagery and greed of Prussian conspirators. We again appeal to every wage earner not yet stirred to the heat by these awful holocausts to register a vow no longer to remain silent spectators of the stupendous crimes which have robbed us of our sons and brothers and left upon the truthful pages of history an indelible stain. Napoleon failed and the kaiser must fail. There can be no peace until he is deposed from the throne he has fouled and his fellow conspirators meet their fate at the hands of an executioner." There has been much peace talk of late, but no tangible evidences of any early cessation of the titanic struggle.

RAILROADS operating between the Mississippi and Missouri rivers and the Rocky mountains were granted increases in freight rates by the interstate commerce commission on many commodities, including agricultural implements, canned goods and boots and shoes. No estimate of the additional revenue the roads will derive from the advances is contained in the commission's report on the case, but it will mount into the hundreds of thousands annually, despite the fact that numerous increases sought were denied. The increase proposed on agricultural implements was about 2 cents per 100 pounds; on canned goods about 1 cent per 100 pounds; on flue lining about 3 cents per 100 pounds; on eggs about 3 cents per 100 pounds; on cider and vinegar from 2 to 7 cents per 100 pounds; on bauxite ore about 20 cents per gross ton; on boots and shoes, about 2½ cents per 100 pounds; on dried fruits, about 5 cents per 100 pounds; on furniture, 7 cents per 100 pounds. The transit charge allowed on fruits and vegetables amounts to 1½ cents per 100 pounds for storage in transit with a minimum charge of $5 per car.

Make Money Pulling Stumps!

Add new, rich, crop growing land to your own farm by clearing it of stumps. Clear your neighbors' land. Your Hercules will be kept busy when others see what it does. Big profits for you. With the

Hercules All-Steel Triple Power Stump Pullers

you can clear an acre a day. The *known* and *proved* stump puller all over the civilized world—easiest to operate.—most durable. Special introductory price, 30 days' trial offer, 3 years' guarantee, on immediate orders. Write for big Free book of land clearing facts.

FAMILY CIRCLE TALKS BY THE PUBLISHER

THE TAX ON GASOLINE.

IT IS quite apparent to me that our congressmen are hearing from the folks "back home," particularly the farmers. They are not nearly so anxious to raise revenue by imposing a federal tax upon gasoline and automobiles as they were a few weeks ago.

I presume some of our lawmakers had no idea the farmers of this nation would be so directly and vitally affected by the proposed taxes. They live in cities, they know little or nothing of conditions in the country. They see the famous captains of industry, the men who have grown rich behind the barrier of privilege, riding to and from their work in their fine limousines, with a liveried chauffeur at the wheel. They decided that a tax upon automobiles and gasoline would serve a double purpose; first, it would raise the necessary funds for the government; second, it would prove immensely popular with the rank and file of the people, being a slap at the rich man and his luxuries. But those congressmen who had such thoughts as these are being rudely disillusioned these days and the farmers who ride to town in motor cars and who use gasoline, by the hundreds of thousands of gallons, for automobiles and gas engines, are doing the disillusioning. They are finding out—what they should have known before—that fully 50 per cent of the automobiles manufactured today are being sold to farmers, that gasoline is a necessity on the farm fully as much as in the city, that the automobile is no longer the rich man's plaything and that the country will positively not stand for increased taxes on necessities when there are so many other and more legitimate ways of raising the necessary revenue.

I am indebted to one of the high officials of the National Automobile Chamber of Commerce for some information in regard to the automobile industry and the manner in which the proposed tax would affect the rank and file of the people, so interesting and pertinent I pass it on to you:

The general impression that profits are uniformly large in automobile manufacture is a mistake. Our investigations show that within the last four years 600 manufacturers of automobiles either went into the hands of receivers or discontinued business. There are now actually fewer manufacturers of automobiles than there were three years ago. The industry was much depressed in 1913 and 1914. The large profits of a few companies have misled the public

Another false impression in regard to the proposed tax is that the burden would fall mainly on a few states, known as heavy manufacturers of machines, and that many sections of the country would hardly feel the weight of such a law. Statistics already assembled by us show that there are automobile manufactories in thirty-four states. There are 30,000 automobile dealers and garages scattered throughout the country. The raw and fabricated materials which go into the production of the automobile come from all the states of the Union.

Another important issue is the way labor will be affected if such a law is passed. Tracing labor put into all material in the automobile back to its source, it is estimated that 90 per cent of the automobile is labor.

A federal tax on gasoline would fall directly on 2,225,000 users of automobiles in the United States. These may by no means be put in the wealthy class. The average retail price of the automobile during the last fiscal year was but a little more than $800. This shows plainly that it is no longer a rich man's toy. It is used principally by people of moderate means and is largely an actual necessity in their business. Approximately 50 per cent of last year's output was sold to farmers

I believe in luxuries bearing the burden of taxation and necessities being held exempt so long as possible. The automibile is not the luxury today that it was a half dozen years ago, neither is gasoline a commodity without which the farmer can get along and production be held up to its present standard. The farmer already pays a sufficiently high state tax on his automobile; the city man pays this state tax and often a city license or tax in addition. To impose a federal tax on top of all this is unnecessary and altogether wrong, in my opinion. If the government must raise more funds let it be on inheritances, on large incomes and by a direct tax on articles which are plainly luxuries, beyond all question. But let us leave bank checks, automobiles and gasoline alone, for there is no emergency confronting us today great enough to make it advisable, necessary or just to tax such necessities of our everyday life and work.

A FARM LOAN BILL.

AS I PREDICTED some weeks ago, congress is taking up the question of farm credits much more extensively than has ever been done before. A land loan bill, which is expected to have the approval of the administration, has been drawn up and is to be presented to the joint committee on rural credits, of the senate and the house, this week. Inasmuch as this is a very important subject and we should all keep posted I will give you the terms of the proposed bill as well as I can.

The bill would provide a farm mortgage credit system under the control and supervision of a federal land bank board of five members, to be appointed by the president with the approval of the senate. The country would be divided into twelve districts, each with a regional land bank having a capital stock of $500,000, to be issued in $10 shares for purchase by the public. Any such stock not taken within ninety days by private capital or by a local loan organization contemplated by the bill would be subscribed by the federal government.

Business would be done directly between the regional banks and the local bodies which farmers would be authorized to organize in the form of co-operative farm loan associations or joint stock banks, charters for which would be passed on by the land bank board. Application for loans approved by the local organizations of farmers would be recommended to the regional bank of the district. The banks would be authorized to loan out capital stock or to sell bonds to obtain sufficient funds to make the loans, and the farmers would be charged as interest the interest on the bonds, plus 1 per cent. In order to reduce the rate of interest on the bonds the bill will provide they must be acceptable by the banks as security for the deposit of public funds.

The borrowing associations would be divided into two classes, those organized with limited liability and those with unlimited liability. They would appraise the land on which a farmer sought to obtain money and would themselves become liable for the loan. Thus, the bonds would be backed by the regional banks, the local association, the borrowing farmer and a mortgage on the land given to the association. Out of their profits regional banks ultimately would refund to the government such money as it may have invested in the enterprise. Payment of the mortgages by borrowers would be made on the installment plan, running for a period of not exceeding thirty-six years.

I am not prepared now to say that this bill meets with my approval, for I have not had an opportunity to read the full text of the measure and to give it careful scrutiny in order to assure myself there are no jokers and that the farmer's interests are really and truly conserved. But I want you all to keep posted on this matter as congress works upon it, hence the outline which I have given above. We are all united on one thing, that is, the importance of making it easy for the farmer to obtain money necessary to enlarge his farming operations and make production larger and surer. Some of us differ on how this is to be brought about. We should all approach the subject with an open mind and be willing to learn from one another. Congress will have done us all a good turn if it adds to our knowledge on this important matter, whether it ultimately adopts such a bill as is proposed or not.

GETTING A START.

NOTHING gives me greater pleasure than to have my readers write and ask my advice on subjects which are perplexing them. I am not always able to answer their questions as fully as I should like, but I appreciate the confidence reposed in me and I invariably do my best to give advice which is sound and practical. All this entails work, but it is work into which I put my whole soul and which I like better than anything else that the day brings to me. By means of these letters from my farmer friends I keep in touch with the farming situation throughout practically the entire country. I can feel the pulse of the countryside beating through these welcome letters, which come to my desk every day in such increasing number. And what a variety of matters they cover: Practical affairs of every-day farming, heart affairs, financial affairs and so on and on. Here, for example, is one which I have just finished reading, which brings up an old problem in a new manner. Let me quote a few sentences:

I am nineteen years of age. I was born on my father's seven-acre farm. I removed with him to a sixty-acre farm at the age of eight; then, at the age of twelve, to the thirty-acre farm where we now live. My father is seventy years old and a very strong man yet. I would like to have your advice on a very important matter. Do you think I do wrong, for when my father does not need me I do outside work? Most of our land is seeded down, so I have considerable time outside. I work on the railroad three months steady; then do whatever I can on other farms or at odd jobs wherever I can get them. I saved up $162 and still have $131 in the bank. When I get more I want to buy a farm of my own, either here in the grain belt or in some new section. I don't seem to be like other boys at my age; most of them seem to find their enjoyment in town. I never lived in town nor do I care ever to do so. Town has no attraction for me. I have been to town on Saturday night but twice in the last year. I go to town to do trading and such, but that is all.

I thank my young friend for bringing this matter to my attention. His letter rings true; he seems to be possessed of those qualities which will cause him to make good in the world, for he is industrious, anxious to get ahead and apparently able to turn his back upon harmful pleasures and those things which distract the mind from necessary work. At the same time, I hope he does not forget that all work and no play makes Jack a dull boy. Youth is entitled to its harmless pleasures, its little vacation breathing spells. Perhaps it will be just as well if he associates with young people now and then, being careful, of course, to pick only the best companions. I do not believe in young folks allowing themselves to grow old before their time. An evening or an afternoon off, now and then, to attend the sessions of some neighborhood club, a farmers' institute, a short course or perhaps a picnic, is time well spent, the way most of these social affairs are managed nowadays. I am delighted at the tendency of the times in this respect and give the bulk of the credit to those who have made our farmers' neighborhood clubs so popular and practical. There is often much of positive inspiration in the coming together of people whose work and tastes are in common, for we learn by association with congenial spirits. Hence, while I am proud of the fact that my young correspondent is not wasting any time around pool halls and moving picture shows in town, I do want to caution him against holding himself too much aloof from his fellows; it can easily become a habit which he will regret later on in life. Just be careful to get in with the right sort of companions and to insist that all the amusements be harmless and uplifting if possible.

As to his doing wrong in taking outside work, when his father does not need him, I cannot see it in that light at all. I am sure his father must be proud that his son is so anxious to get ahead, so willing to do whatever the hand finds waiting to be done, whether it is plowing, feeding the stock or working as a section hand on the railroad. Of course, I am assuming that the lad does not leave home when his father needs his companionship, that he does not let his aged father stay alone and unattended. When one gets to be past seventy he craves the companionship of his children more than ever before in all his life; the boy should stay at his father's side, if there is no one else there, no matter what outside opportunities to make money are awaiting him. But if his companionship is not actually needed I am sure the father is glad to see his boy working steadily, laying his money aside and planning for the farm which will one day be his own, the fruit of his own industry.

Nothing is more pleasing to me than to see the young folks getting ahead in the world. I have a system or plan in my family by which I reward my sons for their thrift by giving them a certain amount of money when they have saved a certain amount, thus rewarding their saving instinct and making the results large enough to cause them to see that thrift is well worth while. I consider it money well invested to do this, for every dollar that I give them is matched by a dollar which they save, and makes them buckle down to work still harder, determined to make their savings grow bigger day by day.

It will not do for us men who are growing old (in years, I mean, not in spirit, for we can keep our spirit young, no matter what the years) to get the idea that prosperity depends upon us alone; the prosperity of the future will be based upon the industry, perseverance and thrift of our boys and girls, rather than upon us. Let us do what we can, while there is still time, to induce them to work hard and to garner the fruits of their labor. After all, it is not what we earn, but the way we spend our earnings and what we save which is the foundation stone of individual and national prosperity.

A Word to the Rock County Supervisors.

IN THE judgment of The Wisconsin Farmer it is a mistake for the county board of Rock county to turn down the proposition to inaugurate the county agent system. The business men of Janesville and Beloit are interested to the extent of putting up their share of the money to meet the requirements of the Smith-Lever bill. It remains for the board to say that the county will stand its share. As we understand it the only objection to the county agent is expense. There may be a few who have a prejudice against the system proposed, but there is probably not a single farmer in Rock county who believes that he will be injured in any way by a county agricultural adviser. Taxes are high in Wisconsin and farmers, at least some of them, fail to see that the advantages of a county agent will more than overbalance the expense. With their eyes almost shut to the real service which is proposed to be given, they shy from the county agent on the one sticking point that it will mean increased taxes.

The increased tax in Rock county per farm has been very carefully figured out and it will not run more than 15 cents a year to the farm. Now if the county agent doesn't do anything more than get some good literature for the boys and girls in the next year he has earned this 15 cents, which is only the price of a half dozen eggs or a half pound of butter. If the county agent would sit in his office most of the time and simply look after the details of distributing literature and information collected by the federal department of agriculture an the Wisconsin Department of Agriculture, he would be worth more than 16 cents a year per farm.

Supposing the soil is yielding less than it did in former years? Isn't it worth while to have a man near at hand who will examine it and tell you the remedy? The farmer must not think that the county agent simply comes to dispense his own ideas alone. He may not know as much as the average farmer—in many cases he does not, but he has at his command all the scientific knowledge which it has cost this government fifty years of hard study and $250,000,000 of hard cash to collect. Part of the tax money which our Wisconsin farmers are paying goes toward piling up information at Madison, both in the college of agriculture, and under the state department of agriculture. Isn't it worth 15 cents per year per farm to help carry this information back to Rock county? The county agent is simply a student, with the benefit of a great deal of study by others back of him, [illegible] and a dispenser of the same. As such he is worth a good deal more than 15 cents per year per farm in Rock county, if he is any kind of a man at all.

Treating the Wrong Patient.

THE objections which we have previously urged against the recent decisions of the Interstate Commerce Commission permitting increases in passenger and freight rates, because there never was a time when the railroads needed such help less than right now, is borne out by information from a most reliable source.

A careful estimate just made by the trustworthy Bureau of Railway News and Statistics shows that in the year just closed the revenues of American railways increased $101,528,294, while at the same time their operating expenses decreased $69,347,883, making a total increase in net income of $170,876,177 for the year 1915.

In 1914 the railroads paid out a little over $450,000,000 in dividends, which was an average of 8 per cent on their combined capitalizations, including an immense amount of watered securities. It would seem to the man on the farm as though 8 per cent might be considered quite a satisfactory return on such an investment. But in addition to that the railroads now show an increase in net income of $170,876,177 during 1915 as noted above, which is over 35 per cent of their total dividends of 1914.

This increase, which has come largely from greater volume of business and economy in operation, is most commendable and is regarded with approval by the general public. It is also pleasant to note the certainty that even greater rewards are in store for the railroads in the coming year owing to increased traffic, as indicated by the wonderful business revival the country over in the past few months and the resulting increase of freight business which the railroads are utterly unable to handle because of its magnitude. It is also probable that much greater good may be accomplished by more efficient management, and that, having made a saving of nearly $70,000,000 by this means in the year just closed, the railroad companies will not neglect to go further along this line so as to effect even greater savings in 1916 without deteriorating the quality of their service to the public. All these signs of increasing railroad prosperity we regard not only with equanimity, but with pleasure, as healthful and favorable symptoms of general business soundness.

It is only when the Interstate Commerce Commission, under these conditions, grants the railroads an increase in passenger rates that will add 25 per cent to their net earnings in 1916 and an increase in their freight rates that will form another appreciable increase in their profits, that we raise our voice in vigorous protest on behalf of the farmers of the middle West, out of whose pockets these greatly increased earnings must come in the end, since they are the greatest producer of real wealth in the country. It is high time that the commission were informing itself regarding the dividends which these great wealth producers are earning. When it does so it will find that grain-belt farmers are not earning anywhere near so high a rate of interest on their investments as that which the railroad companies will pay this year.

It is the shipping and traveling public which most needs the commission's help at this time—not the railroads. The doctor is skillful enough and has the right medicine in his case, but he is treating a patient who has long since recovered, while another is fast growing weaker for lack of his attention.

Wisconsin Law on Sheep-Killing Dogs.

IN THE past the sheep raiser has had no legal protection whatever against the dogs which were allowed to run at large about the country. It is practically impossible to locate the owner of a sheep-killing dog or at best to collect damages from him. Until 1915 it has seemed impossible to get any sort of a law on the statute books which would effectively control the movements of stray dogs.

At the last session of the legislature the Wisconsin Sheep Breeders' Association strongly urged the passage of an adequate dog law and the movement was supported by stockmen from all parts of the state. The result was that an old statute of little or no value was amended so as to provide:

That any person may pursue and kill upon the premises of the owner or keeper or elsewhere any dog found killing, wounding or worrying any horse, cattle beast, sheep, lamb or other domestic animal.

That when a dog has been known to kill, wound or worry any farm animal and its owner permits it, negligently or otherwise, to leave his premises, he can be punished by a fine of not less than $10 nor more than $25 in addition to being liable for damages.

That, any owner or keeper of any dog who has been informed, verbally or in writing, that such dog has killed, wounded or worried any farm animal, shall, in addition to being liable under the law for damages, be punished by a fine of not less than $25 nor more than $50. In case any one of these fines is not paid the owner shall be committed to the county jail until it is paid, but not to exceed twenty days.

Realizing that the state offers great opportunities for sheep raising, the Wisconsin Live Stock Breeders' Association has been doing much to encourage the industry. Last summer the experienced shepherd who accompanied the "More and Better Live Stock Special" was able to assure farmers who desired to go into the sheep business that they would have protection from dogs, and reports, particularly those from Upper Wisconsin, indicate that sheep raising is becoming an important activity.

Prominent Badgers Farm Bred.

"IT IS the country boy who becomes the brilliant man in nine cases out of ten, because he comes to the city expecting to work and have a hard time. He takes a small room; he spends no money on pleasures; he goes to bed early. He concentrates—and concentration is the greatest virtue. That is what makes for success, not genius, for genius without application soon goes to seed." Thus recently declared a leading religious leader. In Wisconsin the truth of this assertion is found on every hand, as in all walks of life the leaders are frequently men and women who were born and raised in country communities.

Many of the statesmen, educators, leading business and professional men of Wisconsin were farm bred. A brief list of a few of the many noted Wisconsin residents who came originally from small towns or who were born on farms follows:

Congressmen Henry A. Cooper, Irvine L. Lenroot, James A. Frear, Thomas F. Konop, Michael K. Reilly, John J. Esch, John M. Nelson, Senator Robert M. LaFollette, Gov. Emanuel L. Philipp, Ex-Gov. Francis E. McGovern, Hon. W. D. Hoard, Fort Atkinson; Dr. S. M. Babcock; Dr. Charles R. Van Rise; John R. Commons, Richard T. Ely, Edward A. Ross, H. L. Russell, University of Wisconsin; Dr. Samuel Plantz, Lawrence University; Edward D. Eaton, Beloit College; Hamlin Garland, author, West Salem; Zona Gale, authoress, Portage; and Eben E. Rexford, author of "Silver Threads Among the Gold," Shiocton.

Wisconsin Man Is President.

F. M. WHITE, of the agricultural engineering divisions, University of Wisconsin, was chosen president of the American Society of Agricultural Engineers at the annual meeting of the society held last week in Chicago. Mr. White had previously been secretary and treasurer, and this work now falls upon C. K. Shedd, assistant professor in agricultural engineering at Iowa State College, Ames, Iowa.

Other officers for the year are: Spencer Otis, Barrington, Ill., first vice president; M. M. Baker, Peoria, Ill., manager of the Holt Manufacturing Company, second vice president; F. S. Harris, director of agricultural engineering, state agricultural college, Logan, Utah, and William Louden, Fairfield, Iowa, councilmen.

The meeting just held was the twelfth annual session of the association, which was organized at Madison, Wisconsin, with the object of promoting the art and science of engineering as applied to farming.

Ensilage Not Injurious to Teeth.

TALES have been told and retold regarding the bad effect of feeding ensilage on the health of farm animals. Two decades ago the idea prevailed in many quarters that ensilage impaired the breeding qualities of animals, while it was a common notion that the feeding of ensilage injured the teeth, thereby shortening the lives of animals. The silo has practically lived down all such evil reputations and it is rarely that we find a case reported where good ensilage has in any way injured any animal.

In the following communication an Illinois subscriber gives a somewhat detailed though brief description of the character of cattle teeth, and points out that ignorance in regard to the real nature of teeth has sometimes led to a false acceptation as to the injurious effect of certain kinds of food, particularly ensilage. He writes:

On general principles the teeth of young cattle always should be examined when an animal fails to thrive as it should. I used to know an old gentleman who made the rounds of the community once a year and examined the mouth of all young cattle. His job was to remove milk-tooth crowns, which often lodge on top of incoming permanent molars and make the chewing of feed painful and imperfect. For all animals thus treated he received 25 cents each. This may be novel reading to some, but it is well worth remembering and acting upon.

The teeth of all adult cattle are loose. They have to be loose—shovel-shaped, and set in at an angle, else they would lacerate the cartilaginous pad, which takes the place of upper incisor teeth in cattle. Once a farmer told me that he had suddenly discovered that the teeth of his sick cow were loose, and he suspected mercurial poisoning. This looseness also has given rise in part to the false accusation that silage loosens the teeth and causes them to drop out. Such is not the case. This is proved by the success of thousands of dairymen in the feeding of corn silage. In fact, the silo is now a necessity on every dairy farm.

Incisor teeth of full grown cattle have narrow or small necks and wide, flat crowns. They gradually wear down as the animal ages, and when a cow is well past twelve years of age examination will show that she is chewing with the small collar-stud-like necks of her teeth. Jaws with such vestiges of incisor teeth may be found at almost any slaughterhouse where old canner cows are made into the "sinews of war." Such cows, no longer fit for dairying, or having gone wrong in their udder, commonly are sold to the butcher or fattened for sale. [illegible] that makes them fail to chew well. The molars or grinding teeth are irregular in shape, and need attention. Sharp points should be cut off and the teeth worn down, then the old cow may take a new lease on life.

Instances have been called to our attention where the cutting of corn in too short lengths has resulted in sore gums, because in that case the fiber of the corn frequently inserted inself between the molars. Animals in such a case could not avoid chewing, as it were, against the grain of the fiber, but that difficulty has been obviated by cutting the corn into sufficient lengths so that it could be masticated without wedging itself in between the teeth, thereby irritating the gums and causing soreness.

Unquestionably too little attention is paid to the molars of cattle. Just as soon as a horse gets out of condition the owner looks for trouble in the mouth, but in the case of cattle a condition of unthrift that persists for a few weeks sinply results in the animal being marketed for what it is worth. Of course, it is the work of an expert to undertake a task of this kind, though it is altogether likely that the benefit that would be derived from the proper care of the teeth would much more than pay for the services of such an individual.

PULL TOGETHER FOR PROFITS.

When Business Men of Columbus, Columbia County, Saw Dairy Dividends Diminishing They Supplied the Co-operation Which Is Making Dairying in That Section More Profitable.

GUERNSEY HERD OF DR. L. A. WRIGHT COLUMBIA COUNTY.

THAT concerted, co-operative effort will do in any community toward improving general agricultural conditions is being splendidly exemplified in eastern Columbia and western Dodge counties, a district of which Columbus is the hub. Here the farmers who a few years ago were going out of the dairy business rather than into it when it appeared the salvation of the situation are building up their herds to higher stages of efficiency; are making more money from their farms and are building better homes; improving their barns, etc.

Three years ago the business men dependent upon this section for its farmer trade began to realize that farming conditions were not as they should be; that grain production had fallen and that farmers were no longer receiving thousands of dollars every fall from this source; that neither the dairy or meat cattle industry had been developed to replace the loss in income from the sale of grain. Investigation at the creameries revealed that cream checks were not so alluring as they were two decades ago, indicating that the farmers were getting away from dairying rather than into dairying. Occasionally a creamery had failed and perhaps left an unpaid note and no funds in the banks to meet outstanding checks. Many farmers were gradually reducing their dairy herds because they thought dairying unprofitable, and this in spite of the fact that the Columbus section adjoined that part of southern Wisconsin which is growing rich from dairy farmng.

The more the business men looked into the situation the worse they found it.

Columbia and Dodge county, these Columbus men knew, were as fertile as any spot in Wisconsin. Farming could be made to pay better with the introduction of new and modern methods: better dairy cows and organization. The farmers knew it too, so the Columbus Dairy Improvement Association came into existence three years ago.

Much of the credit as the "man behind the gun" goes to Mr. J. R. Wheeler, vice president and cashier of the Farmers & Merchants' Union Bank of Columbus. Mr. Wheeler, before anyone else, saw the condition confronting the business interests of that community. Mr. Wheeler, as a banker, in intimate touch with the farming, creamery and mercantile interests, had been watching and studying the situation for many years. He had visited other sections of the state, making some interesting comparisons and concluding that dairying was the salvation of the situation he began to enlist the aid of farmers and business men whose effort resulted in the organization of the organization of the Columbus Association. Mr. Wheeler called together the Columbus Business Men's Association and outlined a plan, pointing out the need of improving the soil and conserving fertility. He emphasized the importance of better bred cattle and necessity of testing and weighing the milk and feed in order that unprofitable cows would be cleaned and dairy farming placed on a profitable basis. He pointed out the value to the creamery man of the increased quantity of milk that would be delivered showing that the increase in volume could be taken care of without any increase in over-head expense in operating the creamery and with the profits increased the creamery man could afford to pay the farmers more for their milk, thus increasing the farmer's profits. And finally, he urged the merchants to consider the change in their situation when the farmers began to receive a steady monthly income from the sale of large quantities of milk.

The business men gladly set aside $300 for prizes to encourage the farmers to join the dairy association it was planned to form. Meetings were called at several near-by creameries and one at the City Hall in Columbus where large numbers of farmers congregated and were addressed by experts in dairying and live stock farming, and the plan was unfolded. The result was that on September 1, 1913, the Columbus Dairy Improvement Association sprang into existence. Then followed the formation of a cow-testing association.

One of the first works of the association was to hold a dairy development contest for which the Columbus Advancement Association had set aside $300. The results of this contest were startling, to say the least, as it developed that practically every herd had some cows of splendid productive ability and every herd had some that were not of the best. Some cows that were thought to be the best proved the poorest, and some thought to be "boarders" proved the best. Three cows were sold the first year by one member for $30 apiece more than the owner would have asked if he had not had their records. One member bought three cows that produced more than the seven he sold, and in a number of cases improved feeding methods were introduced with splendid results.

Already the association has practically eliminated all except pure-bred registered bulls and has induced the purchase of pure-bred Holstein, Guernsey and Jersey females in limited numbers with the certainty of having a large number of pure-bred herds eventually owned and managed by farmers who appreciate the value of breeding and of testing and measuring a cow's production. The greatest result probably has been in perfecting an organization of men who are interested in the same thing, the building of a big, profitable dairy and cattle industry. The energy and ability of the members will determine the success of the industry and with the improvement made in three years it is hoped to see Columbus the center of the greatest dairy center in the country.

The contest was not continued the second year as it served its purpose in awakening the interest of the farmers. Some members dropped out the first year, but their places were soon filled. The dues to the improvement association are 50 cents a year, while the cow testing is done on the $1.25 plan per cow, which is in vogue throughout the state. The association is now planning to hold an annual cattle sale at Columbus. Both pure breds and grades will be offered at the sale, and this will tend to increase more interest in better dairying and the value of good cows.

One of the master strokes of the association and Mr. Wheeler was an automobile tour of twenty-two farmers to some of the crack farms in Wauwesha, Walworth and Jefferson counties. Here they saw good blood everywhere; finely equipped barns; well paying farms, etc., and they returned home with new inspirations and ideals. Another tour was planned for last fall and some time ago when one of the farmers who made the trip met Mr. Wheeler on the bank steps, Mr. Wheeler asked:

"Going to make the trip with us again this year, aren't you?"

"No, I don't believe I can afford it," he replied. "That trip last year cost me over $300."

Mr. Wheeler, surprised, as the cost was less than $2 a day, inquired why the cost was so great, and the farmer replied that when he got home he had to make his barn over and that he wasn't satisfied any more with old conditions.

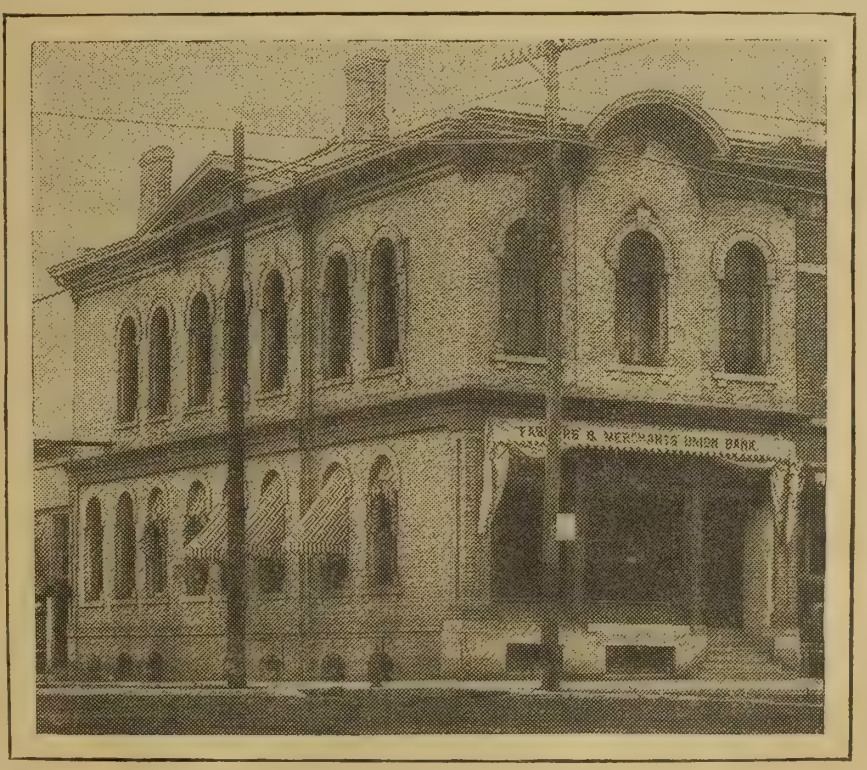
Creamery men in that community report much better conditions; cream checks are getting bigger and the farmers who are getting good blood into their herds are appreciating the profit on sales of young stock, etc. This report on the results of the contest shows the difference between the best and poorest herd of ten cows in the association:

The best herd made a net profit of	$604.23
The best cow in this herd made	94.08
The poorest cow in this herd made	17.25
If all were as good as the best, total profit would have been..	940.80
The poorest herd among the prize winners made	279.28
The best cow in the herd made.	61.41
The poorest cow in the herd lost	8.65
If all were as good as the best, profits would have been.....	614.10

The present officers of the Dairy Improvement Association are: President, G. H. Weber, Hubbleton; vice president, John Swarthout, Fall River; secretary and treasurer, Ralph Webster, Columbus. Directors: John Sennhenn, Columbus; Harvey Huggett, Fall River; W. J. Klug, Columbus; Henry Westphal, Columbus.

Relph Webster is also secretary of the Columbus Cow-Testing Association.

MR. J. R. WHEELER, COLUMBUS.



FARMERS AND MERCHANTS UNION BANK.
Where plans were laid for building up a great cattle industry in vicinity of Columbus, Wis.

FARM HOME OF MR. JOHN J. SWARTHOUT, FALL RIVER, WIS.
Mr. Swarthout is a Holstein breeder and vice president of the Columbus Dairy Improvement Association.

In and Around Wisconsin

Many Community Breeders' Meetings Will Be Held This Month Followed by State Gatherings at Madison in February.

Tobacco buyers who are now riding the tobacco country report that the acreage in Wisconsin next year will be large despite the fact that the crop was poor this year and the prices a trifle off. The farmers figure that the short crop this year with improved business conditions everywhere is bound to raise the prices next year, and for that reason there will be money in tobacco in 1916.

Reports from the sugar beet factories which operated in Wisconsin this year indicated a big year for the farmers who grew this crop. The factory at Menominee, Mich., paid out $485,000 to farmers in that vicinity, many of whom lived in Marinette county, Wisconsin. This company contracted for 9,000 acres and 7,200 acres were actually grown. Similar encouraging reports come from the factories in this state.

The recent report of John S. Klinka, county agricultural representative of Polk county, shows the value of such work to the farmers of that county during the past year. This was the first year of agricultural work and Mr. Klinka carried on many experiments and aided the farmers in numerous ways. Nine preliminary surveys of marshes were made during the year; eighteen herds were tested for tuberculosis; two short courses were held; eight herds consisting of ninety-five head were vaccinated for blackleg; seventeen farmers were assisted in spraying their potato fields; five experimental plots were conducted; milk testing was inaugurated in the graded schools with the co-operation of the county superintendent and a ten weeks' course in agriculture in the training school was conducted in addition to the numerous calls which were answered and conferences and meetings held.

Wisconsin winners in Golden Glow corn at the corn show in St. Paul were announced as follows:

District No. 1—1st S. S. Foster, New Richmond; 2d R. H. Brunner, Hudson; 3d Roy McDonald, Dunn; 4th Tom McDonald, Dunn.

District No. 2—1st S. P. Markle, La Crosse; 2d Fred Smith, River Falls; 3d J. Van Loone, Shelby; 4th William Willinger, Galesville.

The Sauk Prairie Farmer's Club, Sauk county, held its annual meeting recently and elected officers for the coming year. J. H. Hill was chosen president; S. Premo, vice president; Mrs. R. C. Kindschi, secretary, and W. Welch, treasurer. The year closed with ninety-four names on the membership roll, and the officers expect this to be increased to more than 100 this year.

The annual meeting of the Wisconsin Live Stock Breeders' Association will be held at Madison on February 10th in connection with Farm and Home week at the college of agriculture. During this week, on February 9th, the meetings of the Western Guernsey Breeders' Association; the Wisconsin Jersey Breeders' Association and the Wisconsin Holstein Breeders' Association will also be held at Madison.

Dunn county farms which have been registered recently are the following:

Hazel Hurst Stock Farm, Frank Stewart, Menomonie.
Grassland Farm, Paul C. Wilson, Red Cedar.
Bubbling Spring Farm, T. B. Wilson, secretary, Lucas.
Highland Farm, Alfred Thomas, Menomonie.
Clover Leaf Guernsey Farm, Henry Miller, Weston.
Valley View Farm, Paul C. Wilson, Lucas.
Fair View Farm, John McGiltor, Tainter.
Hampshire Park Farm, C. V. Goff, Tiffany.
Willow Brook Farm, S. W. Cronk, Dunn.
Lake View Farm, M. F. Stevens, Dunn.
Oakwood Farm, Ole Clementson, Red Cedar.
Oak Grove Farm, L. G. Stevens, Dunn.
Woodland Farm, George Chrislow, Spring Brook.
Fern Hill Guernsey Farm, John Cramer, Red Cedar.

Waukesha county Guernsey breeders, members of the Waukesha county Guernsey Breeders' Association, will gather at the Resthaven hotel, Waukesha, on Thursday, January 27th for their annual winter meeting. The officers are making plans to take care of about 200 Guernsey enthusiasts at the banquet which will be held at noon, preceded by a business session in the forenoon and followed by a program in the afternoon. The program speakers have not been announced, but among the guests and speakers will be Gov. E. L. Philipp, who had planned to attend last winter, but was prevented by official business. All breeders, whether interested entirely in the Guernsey breed or not, are invited to attend and a big time awaits those who can attend. The business men of the county have also been invited to be present.

The annual winter meeting of the Waukesha County Holstein-Friesian Breeders' Association will be held Tuesday, January 11th, at the Resthaven Hotel, Waukesha, and all members and breeders are urged to be present. The business meeting will start at 10 a. m.; followed by a banquet at noon and a program in the afternoon. Prof. E. B. Hart, of Madison, will be one of the principal speakers and has been assigned the subject, "The Specific Effects of Feed in Animal Nutrition." Mr. W. L. Baird, secretary, in writing The Wisconsin Farmer concerning the plans for the coming meeting, says that activity in Holsteins has been particularly marked throughout the county the past year. He says Holstein breeders frequently are criticised for not paying sufficient attention to yearly records, but the report from R. T. Harris shows that within the county (and Waukesha county is noted for several dairy breeds) that out of 203 yearly records made 121 or 60 per cent were made on Holsteins. Fifteen per cent of all the official testing in the state was done in Waukesha county. Membership to the association has increased 25 per cent within the past year.

A very successful grain and corn show was held recently at Knapp, Dunn county. Some splendid grains were on exhibit and the sweepstakes prize was awarded to Will Hart, of Boyceville, and the silver loving cup to Ole Alderson, of Downing. The following awards were announced:

Yellow Dent Corn—1st Roy McDonald, Menomonie, R. R. 5; 2d Elmer Kopp, Caryville; 3d Fred Price, Boyceville, R. F. D.
White Dent Corn—1st Elmer Kopp; 2d Roy McDonald.
Wheat—1st John McClelland, Knapp; 2d Fred Price; 3d Roy McDonald.
Potatoes—1st August Casper, Knapp; 2d Will Hart; 3d Ole Anderson.
Oats—1st R. J. Leischer, Knapp; 2d August Casper; 3d Carl Sabatke, Boyceville, R. F. D.
Barley—1st Carl Sabatke; 2d Fred Price; 3d Will Hart.
Timothy—1st August Casper; 2d Will Hart.
Clover—1st Will Hart.

F. H. Scribner, the well-known extension worker and breeder of purebred Jerseys, has sold his farm at Rosendale, Fond du Lac county, to Frank Lawson, who will take possession on April 1st. The farm sold for $175 an acre and consisted of 87½ acres. The farm will be under the direction after April 1st of Mr. Lawson's son, Frank. The Scribner farm will be under the direction after April 1st of Mr. Lawson's son, Frank. The Scribner farm has been operated for some time by R. M. Scribner, the son of F. H. Scribner, and before they give possession there will be a public sale of the Scribner herd of Jerseys. Mr. Scribner is well known thoughout Wisconsin because of his connection for years with the United States department of agriculture and the farmers' institutes. He has been a familiar figure at all important farmer's gatherings for years and his sale of the farm means his retirement from active farm life, but it will give him more time for his extension work.

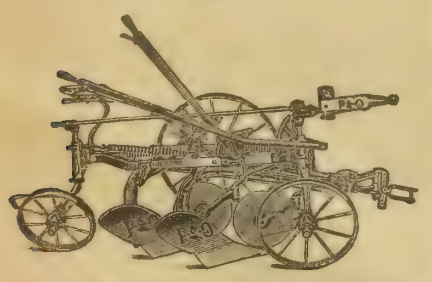
Dunn county boosters have taken hold of the affairs of the Dunn County Agricultural Society and it looks as if a reorganization is to be perfected which will result in a good fair next year. The members have decided to continue the organization as a stock company with $10,000 capital, and if their plans are carried out the future of the fair is assured. These shares will sell for $10 and it is hoped to dispose of 1,000 shares soon.

The Waupun Hemp Growers' Association held its annual meeting recently at Waupun and the meeting was well attended by farmers who are interested in this comparatively new industry in this state. Waupun is one of the three principal hemp-growing sections. The association decided to incorporate for $10,000; the stock to be sold in $50 shares with a limit of 10 per cent for any one person. It was also decided to permit the farmers to have first choice in the purchase of stock and to draft a constitution and by-laws. The question of buying hemp seed through the association was left to the directors.

P & O

Diamond Riding Plows

Sulky or Gang, right or left hand, all standard sizes, all styles of bottoms, according to the requirements of different sections. For eighteen years the leading riding plow in this country. "It's the Way We Build Them."



High lift, light draft, automatic control and perfect bottoms. Removable dust proof wheel boxes with hard oil screw caps. Beams are high in the throat, giving ample clearance in deep plowing. Double bails hold plow steady and rigid, making it run absolutely true and leaving a smooth, level furrow bottom. Only truly automatic rear wheel control ever put on a plow; holds rear wheel rigid regardless of ordinary weaving of team, but allows it to castor naturally on the turn, making a square turn possible.

Collars and linch pins inside the screw caps take end thrust off of boxes. Bottoms so hung in frame as to throw weight of plow, dirt and driver all on wheel, insuring light draft. Spring washers prevent nuts from working loose. High grade coulters with chilled cone take-up bearings, and quickly adjustable clamps.

Powerful foot lift. Hitch adjustable without removing bolts or pins. Bottoms are built on double ribbed malleable frogs, the strongest made; strong in the bend where steel frogs are weak. Different types of P & O bottoms interchangeable. P & O Diamond Plows have every convenience and adjustment for the performance of perfect plowing.

Monarch Steel Stump Puller
Sold On 5 Year Guarantee—Investigate

Made of steel. Has all modern improvements. Easy to operate. Triple and Double Power Machines clear 1 to 5 acres per day including stumps up to 7 ft. in diameter. It will pay you to get our catalog and guarantee. Zimmerman Steel Co., Bettendorf, Iowa. Dept. WS

REO

The New REO the Fifth

The Incomparable Four

$875 f.o.b. Lansing Mich.

Reo Quality Is Uniform—Every Reo Car Is a Good Car

YOUR REO MOTOR—the motor that will go into your Reo—into every Reo car—is dynamometer tested. Perhaps you don't catch the full significance of that statement—sounds like "shop talk" to you.

ALL RIGHT, WE'LL EXPLAIN: And in the explanation perhaps we can show you why Reo quality is uniform—why every Reo is just as good—just as powerful, just as sweet-running and just as low in upkeep cost as the best Reo we ever made.

MOST MAKERS CONSIDER it sufficient to subject every tenth or every fifteenth and in some cases every one-hundredth motor to the dynamometer test. (Of course we are speaking now of those leading makers who have this expensive equipment. Many scarcely know the meaning of the term.) It is considered sufficient gauge of the accuracy of workmanship and the power of motor to test one "about every so often."

IF THAT ONE PROVES UP it is assumed that the rest of that day's run will average about the same. If it falls below the requirements in the test it is in like manner assumed that the rest are below standard—and measures are taken to correct it in the next batch.

MEANTIME YOU MIGHT be one of those to get one of those that didn't prove up.

NO; WE REO FOLK do not consider that kind of testing sufficient. It isn't sufficient, for example, that the Reo we sell you "averages up." The Reo standard says your Reo must be as good in every respect as any Reo ever turned out of the factory—a little better if possible, since today's cars ought to be better than yesterday's.

AND SO YOU CAN KNOW—you can feel absolutely sure—that the individual car we deliver to you, has, itself and its every part, passed through the most rigid tests.

IF YOU COULD VISIT the big 30-acre Reo plant at Lansing, Michigan, and see the four rows of dynamometers with meters and other electrical equipment, you would exclaim, "What an expensive testing equipment!"

BUT WHEN YOU DRIVE YOUR Reo car you will appreciate the economy of a testing system that guarantees every buyer the utmost satisfaction for his money and makes you and every other Reo owner a booster for Reo.

IS YOUR ORDER IN the hands of your Reo dealer? If it isn't, you may be disappointed. Demand is tremendous, and only those who order well in advance can hope to get a Reo.

Reo Motor Car Company, Lansing, Michigan, U. S. A.

$1250 f.o.b. Lansing, Mich.

Herd of Holstein-Friesian cattle, owned by Cedar Lawn Stock Farm, near Burlington, Wis. Tests show some extra good animals in this herd.

Organization For Dairy Farmer.

From an Address by Charles E. Reed, of Neillsville, Before the Cheesemakers' Convention at Marshfield.

NEED of being organized. What does it mean? Need of: First, as far as my experience has gone I shall try to discuss the need of being organized in a body for the good of the dairy interests and then follow up with the manner in which such association should be carried out and sustained.

One great need for organization is for education in the arts of cheese and buttermaking, and also in dairying in general, by forming an organization for this end. We will all meet at the general meeting and listen to carefully prepared addresses upon certain subjects pertaining to the interests, for which the meeting is called, and there enter upon discussions of the subject so that in that way we will each and everyone be able to learn a great deal from so doing.

In cheesemaking one will tell his experience and then another; and from that each one may take good points home and put them to practical use. The same with the buttermaker and also the dairy farmer. He will be told how to produce the greatest amount of raw material from the most economical standpoint, and not only that but also a good, clean, pure article, and thereby help the manufacturer manifold, because there is a small chance of making a good article if the raw material is not right. Thus you see organization means education of every one; and it is an established fact that education is the most important part of each and every person's life, that is, keeping up with the times in which he lives, and not falling into a rut what is by use worn so deep that he cannot steer out. Next, in organization we find power. Power to do and power to cause to be done; for in union there is stength. We will then stand as the old, old saying of the bundle of sticks, united in one bundle they cannot be broken by the strength of a giant, but take one separate stick, the same may easily be broken. By being united you have the power to see that the best legislation is brought about, for the interests for which you work and also that the objectional stuff is thrown out. For who knows best what laws should be enacted for us: The representative in the legislature, or the man in the field, who has had to live and work under such laws?

Every little business of today has its union or advancement association, all working for the best interests of each other in their particular business. Take also the manufacturers of your city, each is an organization in itself, each machine and each man has his particular part to do in turning out the finished product. Take for instance, the chair in which you sit, and think it out for yourself, and see if it does not work out as one article—the end of an organization. But the one for the dairy interests is for a broader nature in all, in that we must take in a much broader and deeper field of work.

We must eliminate the word "protective" and insert "advancement," for it is advancement we wish for, and when we get that we will have all the protection that is necessary, just from being united, and striving for a right end. The watchword of the present day is co-operation. When we organize the dairy farmer and all the manufacturers of dairy products in one body for the good of each other and for all, we have then perfected the best-known line of co-operation; for then the dairyman will produce good, clean, pure milk and will have his premises kept in accordance with the production of the same. Then we will have attained the one great end we are working for, which is: To put Wisconsin above where she is, by raising the standard of our manufactured products to the highest mark of efficiency and will also have all the cheese and butter made in Wisconsin of a uniform quality, because, we as manufacturers will then all be working on the same basis and all have the same or nearly the same quality of good milk to make up, and therefore get better and more uniform prices; that is in each locality that is so organized and I hope to see in the near future the whole state organized as we are over in Clark county, Cheese and buttermakers and dairymen in general all united in an association for the one great purpose of what article ten of our constitution reads: "Any person who takes a vital interest in the development and betterment of the dairy interests of Wisconsin is eligible to membership."

That, you will readily see, in time will mean the whole community, and community development for the main interest of Wisconsin which is dairying, because the lumberman's ax is beginning to be but an echo. And by being so organized we can then interest the wholesaler and the banker, and in fact, nearly all lines of business to turn in and work with us. Show me the man, woman or child who is a citizen of our great state that does not look with pleasure upon Wisconsin's being in the lead in her productions.

The new license law which I understand will be discussed here is one step in the right direction for uniformity of quality and in being united for co-operation. I believe we should not look too much for individual profit and should let the so-called middleman stand where he is, because he has made a life study of his business which would take time and money, should we as communities try to take upon ourselves his place, for we can then soon produce a product that will sell itself, and for the top-notch prices.

Again organization is co-operation; then why not all parts of the state form such and all become members of same? Then form a state-wide dairy board of trade where every pound manufactured will be sold under penalty of a statute of the state of Wisconsin, making it compulsory, where all of Wisconsin uniform and standardized cheese and butter made, will be sold for uniform prices that are governed by the laws of supply and demand.

In so doing the big interests will not be able to dictate, as we all know they do. There will be only way out. They can buy or some one else will, and then we have solved a great problem in the Wisconsin Dairy Market. On May 8, 1915, at Granton, Wis., there was formed by a dozen enterprising cheesemakers, the first and only existing association of this kind in the state. At the present time the whole county is talking about its meetings and the good it is doing and striving to do.

Winter pruning is more essential for fungous growth in apple trees than for insect, according to a bulletin from the Connecticut station. Of course, one of the chief reasons for pruning is to take out unnecessary and interfering branches and shape up the tree. This also improves the dry air drainage whereby infection by fungi is lessened.

For the FIFTH Time Studebaker Sets NEW Standards of Value in a NEW Studebaker that gives

STILL MORE conveniences
STILL MORE beauty of design
STILL MORE roominess everywhere
STILL MORE refinement of mechanical design
The same POWERFUL motor
And the SAME sterling quality in every detail at a REDUCED PRICE!

—roomier

Much more room for the driver has been gained by removing the gas tank from the cowl to the rear and moving the cowl-board upward and slightly ahead of its former position.

More room has also been gained in the tonneau by moving the front seats forward a few inches and making them adjustable to the passengers' personal comfort.

—handsomer

Changes have also been made in the design of the car which greatly enhance its graceful lines. The fenders, for instance, have been made heavier, deeper and richer, following the curves of the wheels more closely. And with the gas tank hung on the rear, the whole car has a substantiality of appearance that is very attractive.

—NEW Conveniences

mark the car throughout. Especially the gas tank in the rear and the reliable Stewart Vacuum System set on the intake manifold. This insures positive feed at all times.

Clutch and brake pedals are longer by 3 inches, affording greater leverage and ease of control. The windshield is designed to overlap thus assuring complete protection in any storm. The switches, gauges, speedometer are all conveniently located on the cowl, lighted by an indirect system of lighting.

Studebaker

Series 17 FOUR
40 h. p. 7-passenger $845

Year after year, Studebaker has led the way in the motor industry. Year after year, Studebaker has startled the entire country with new high quality cars at new prices that seem revolutionary—prices that entirely recast the existing ideas of value in motor cars. And now, for the FIFTH time, Studebaker sets NEW standards of value in 4-cylinder cars with the SERIES 17 FOUR at $845.

And never has there been a finer example of what that name of Studebaker guarantees to the buyer of a car than NOW. Studebaker with its GREAT resources, its unrivaled buying powers, and its enormously increased volume of manufacture, has been able to REDUCE its price from $885 to $845—a SAVING of $40 to every man who buys a Studebaker.

And at the same time, "—because it's a Studebaker"—backed by this gigantic manufacturing institution, the same high quality of the car has been maintained. It has never been Studebaker's policy to reduce the quality of any product in order to reduce the price. That name of Studebaker has been a guarantee of QUALITY for too many years. And so this car, even at its sharply reduced price offers MORE room, MORE conveniences, HIGHER quality and even handsomer design than ever before.

It is the MOST POWERFUL 4-cylinder car that has ever been offered at anywhere near this price of $845. It is the FIRST 4-cylinder car to rival the flexibility of a SIX. And with the many improvements that have been made in the new model, it is the BIGGEST dollar-for-dollar value that the market has ever seen. See it at your local dealer's before you decide on any car. See how much a dollar will buy in a car "—because it's a Studebaker".

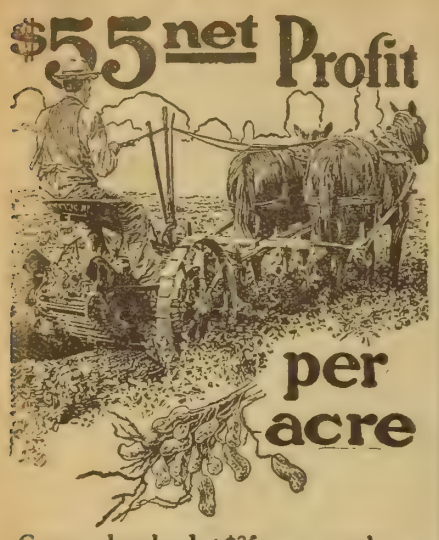
More than 207,000 Studebaker Cars now in use



Can you buy land at $35 per acre where you now are and make $55 per acre *net* on it, on a staple, field crop? Can you make that much net on *any* priced land in your section? Folks along the

Cotton Belt Route in Arkansas & Texas

are doing it. Wherever accurate reports are kept, the net profit per acre on peanuts averages well above $50 per acre. J. T. Walker, near Jonesboro, Ark., made 45 bu. of threshed peanuts and 27 bales of peanut hay per acre, bringing $1 per bu. and $1 per bale. It cost him only $17 for planting, growing, threshing and harvest, leaving $55 per acre net. J. M. Story got $63 per acre net. Land like Mr. Story's, costs only $35 to $50 per acre now.

It's the character of the land and climate that makes peanuts so profitable a crop down there; and the same conditions make other crops extra profitable. Take ribbon cane, for instance: J. F. Chenault, near Redwater, Tex., makes over 400 gallons of syrup per acre from ribbon cane, netting him $200 profit per acre.

Frank Federer came south to Brinkley, Ark., to escape the long, raw springs of Wisconsin; he says he can raise as much there on $15 land as he did in Wisconsin on $200 land—because the soil is just as rich, the crop season is much longer and short winters cut every expense.

Two free books!

Written by a farmer who knows what any farmer elsewhere would want to know about a country that he was considering coming to. They tell about not only the character and cost of lands, climate, crops raised, etc., but about schools, churches, towns, social conditions. Brimful of actual photograph pictures "taken on the ground." Send me your name and address on a postal card today and get these free books now.

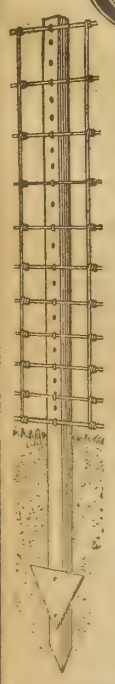
Chicago STEEL FENCE POSTS



Can't Help But Save You Money

They cost less to install—last a lifetime without repair. They guard your crops from insects that live in wood posts and fence-line weeds. With them you can burn clean through your fence, kill the insects and gain more tillable land. Build your new fence and replace rotting wood posts with Chicago Steel Posts. *Made from same material used in old black wire.*

Guard Your Cattle With These Posts

A wood post wire fence exposes your cattle to lightning. *Wood posts will not ground lightning—Chicago Steel Posts absolutely will.* Let us tell you more about these posts and explain how you can save the price of an automobile.

CHICAGO STEEL POST CO.

Four & Two Horse Four-Burr Mills

Grind from 15 to 50 bushels per hour.
Ear or shelled corn. Small grain in proportion.
Best line of mills sold, including the famous Iowa for $12.80.
We also manufacture Bovee Steam Feed and Dairy Boilers. Cat. free.

Bovee Grinder & Furnace Wks., 104 8th, Waterloo, Ia.

STATE AID TO WOODLAND OWNERS IN WISCONSIN.

The forestry branch of the newly created conservation commission desires to co-operate with the owners of woodlots and timber tracts and is now prepared to give special attention to the different phases of forestry that are of interest to those who desire to improve their wooded or bare areas by planting trees or by introducing practical forestry methods.

On request to the commission an expert forester will make a personal examination of the land in company with the owner, tenant or farm superintendent. Where the tracts are small the entire area will be carefully cruised and such trees marked for cutting as would bring about the desired results from the standpoint of proper forestry practice. If the tracts are 100 acres or more in extent the forester will lay off sample plots of suitable size to demonstrate the proper handling of the woods in each type of the stand and trees of undesirable species will be marked for removal. Recommendations for management of the areas, no matter how small, will be embodied in a brief report and forwarded to the owner as soon as practicable after the examination.

Similarly, advice will be given as to the best methods of replanting open lands, the replanting of areas cut over, planting among thin stands and underplanting to preserve or create good forest conditions.

The more important features of a planting plan are: Location, area of site to be planted, purpose of plantation, detailed recommendations for planting, which include cost of plant stock, cost of planting, method of planting, care and protection, species and spacing and methods of subsequent treatment.

The commission is also glad to furnish a speaker for any organization wishing to arrange a lecture on forestry. It is urged that wherever possible the meeting be preceded or followed by a field excursion, in which the lecturer can make final suggestions, as a field trip greatly increases the helpfulness of a meeting. Application for advice and co-operation should be addressed to the conservation commission, Madison, Wisconsin. The only expense connected with the inspection and lecture work will be the necessary traveling expenses and maintenance from the nearest previous inspection.

In order to encourage farmers and other landowners to plant idle and waste land in this state the conservation commission is growing trees for forest planting on a large scale, which will be sold at the approximate cost of raising. Trees of the following species are available for distribution:

	Per M.
White pine transplants, 4-yr.	$4.00
White pine transplants, 3-yr.	3.50
White pine seedlings, 2-yr.	1.50
Scotch pine transplants, 4-yr.	4.00
Scotch pine transplants, 3-yr.	3.50
Scotch pine seedlings, 2-yr.	1.50
Norway spruce transplants, 4-yr.	4.00
Norway spruce transplants, 3-yr.	3.50
Norway spruce seedlings, 2-yr.	1.50
Red pine transplants, 4-yr.	4.00
Red pine transplants, 3-yr.	3.50
Red pine seedlings, 2-yr.	1.50

The commission will need to know the character of the land as regards topography, kind of soil, original growth, present growth and previous use of land.

Write the conservation commission for an application blank for forest trees and indicate the number, kind and age of stock desired. A bulletin on forest planting in Wisconsin will soon be available and may be obtained on request.

INSPECTION OF APIARIES.

To the Editor:—More complete inspection of apiaries, better education in beekeeping and more complete co-operation on the part of the beekeepers of the state are the things most needed to develop the bee industry of Wisconsin, according to N. E. France, state inspector of apiaries. In an address before the Wisconsin Beekeepers' Association which met in Madison on December 9th and 10th Mr. France reported progress which has been made during the past year. At the convention held here in 1914 it was decided that conditions among the apiaries of the state demanded that beekeepers be instructed in methods of managing bees and in the handling and marketing of the products. Accordingly, meetings and demonstrations were held in any county in which the keepers applied for such service.

Meetings were held in Winnebago, Rusk, Pierce, Clark, Green and Dane counties at which nearly 9,000 colonies were inspected. Many of the beemen who attended these gatherings were being troubled with American or European "foul brood." As a result of campaigns started at these conferences the diseases are well under control and conditions have been improved.

Mr. France urged the members to support the strict observance of a law which makes it illegal to move colonies of bees which are diseased or to sell honey which is liable in any way to infect other colonies of bees. He said in part as follows:

If this law is strictly observed a great deal can be done toward totally wiping out the disease. Another source of contagion is the use of second-hand honey cans which many of the members agreed should be prohibited by law, as cans shipped from the West are almost invariably infested with foul brood in one or both of the two forms.

The inspector predicted a successful future for the bee industry of Wisconsin.

Economy Gasoline Engines

Built to operate on gasoline, kerosene, natural or artificial gas.
Equipped with Webster magneto at small additional cost.
Shipped immediately from a warehouse near you. Satisfactory service guaranteed.
Tested and rated by University Experts, with a large surplus of power.
Don't buy a gasoline engine until you have seen our special proposition as explained below.

SPECIAL SALE ENGINES AND BUGGIES

We are making special inducements to early buyers during January and February that will enable you to make a bigger saving in the purchase of a gasoline engine or buggy than you can make at any other time of the year.

If you are interested in gasoline engines, write for our special January and February Engine Proposition No. 74W16.

If you are interested in buggies, write for our special January and February Proposition on American Beauty Buggies No. 74W16.

Don't buy a buggy or engine until you have seen this special proposition, as it means a big saving to you.

American Beauty Buggies

We are headquarters for American Beauty Buggies. We sell more buggies than any other two manufacturers in the country.

You will save twenty to thirty dollars if you buy an American Beauty Buggy from us. Because of our manufacturing facilities and tremendous output, we are able to give you better value in our American Beauty Buggies at lower prices than anyone else.

Our American Beauty Buggies have won the lead on account of high quality and low price. We ship them from a warehouse near you. Send for our Special Proposition during January and February, as explained above.

SEARS, ROEBUCK AND CO. CHICAGO.

WITTE ENGINES

BEFORE you buy any kind of a gasoline or kerosene engine, write for my offer, under which I send an engine to earn its own cost while you pay for it. Stationary Engines at **less than $17.50 per horse-power**—2 H-P, $34.95; 3 H-P, $52.45; 4 H-P, $69.75; 6 H-P, $97.75; 8 H-P, $139.65; 12 H-P, $197.00; 16 H-P, $279.70; 22 H-P, $359.80. (*F. O. B. Factory*). Portable Engines and Saw-Rig outfits proportionally low. **Guaranteed high quality**—thoroughly proven during 29 years by many thousands in use at all kinds of work in every state.

Guaranteed 5 Years

Cash or Easy Terms

For my low prices, and under my easy terms of payment during a whole year, you can now, more easily, and better, afford to own an engine, than to do without one.

Fine Book Free My free book, "How to Judge Engines," will show you how to select the right engine, and it will save you money that you want to save, whether you buy now or later. Write me, now.

UPPER WISCONSIN

IN THE MELLEN COUNTRY.

The Mellen Weekly, of Mellen, Wisconsin, Ashland county, recently published a special harvest edition. One of the interesting features of this edition was the page of actual experiences of pioneer farmers in Ashland county. In is interesting to note that most of the farmers who recount their successes on this page came from some other section of the state. There is no doubt but that there are many other good farmers who would be glad to avail themselves of the advantages in Upper Wisconsin. There is not much use in sending our farm boys to the far West to get land when there is plenty of it here at home.

The Andrew Seipel family went to Manitowoc county twelve years ago and settled in the neighborhood of Mellen. Mr. Seipel wanted more land for his boys. He bought a half-section of Hartley cut-over hardwood land and proceeded to clear the same of brush and stumps, and farm it. As his boys grew up, he acquired more land and now he and his sons and sons-in-law own 1,000 acres, a large part of which is improved. The Seipels spent most of their time for the first five years logging, lumbering and clearing land. In the past six years they have combined all their efforts in farming. They have splendid improvements on their several farms, including new farm buildings and silos and also are raising pure-bred live stock.

August C. Schmidt was formerly a gardener near Milwaukee. He moved to Ashland county in 1914. He had previously always been a renter. He bought a 102-acre, partly improved farm, five miles from Mellen. He brought with him a span of working horses, a cow, hogs and poultry. He was occupied during the winter getting wood and logs, and in the early spring started to farm. He blew out stumps and stones with dynamite and put about twenty-five acres under the plow. He raised oats, barley, wheat, corn, potatoes and a variety of garden truck. A good deal of his stuff was marketed at the summer cottages which surround Lake Herbert. Mr. Schmidt built several cottages during the spring, renting them to recreation seekers. He is getting his land into good shape and expects to make a specialty of pure-bred live stock for market and to grow Green Mountain and Rural New Yorker potatoes for seed.

Robert Mattson bought land in Ashland county in 1901 and erected a small log house. He had no money nor tools of any kind. In five years he had done remarkably well but had the misfortune to be burned out by a forest fire. He lost all his buildings, hay and timber. He started over again and at the end of the next five years refused $10,000 for his place. He says he has received the best results from hay, oats and potatoes and from dairying. He has raised wheat [illegible] for [illegible] of a crop, no matter what the weather conditions may be. In the fall of 1915 a measured field of two acres on the Mattson farm threshed out 112 bushels of Swedish Select oats to the acre, and the oats weighed forty-two pounds to the bushel.

These instances might be multiplied. There are many exceptionally fine improvements going up in Ashland county. The farmers in the Mellen country are taking advantage of the new law to name their farms, and registrations have been made this year as follows:

Billy Creek, C. B. Morse, Highbridge.
Brookside Farm, Alex Nyberg, Mellen.
Burr Oak, J. H. Smart, Butternut.
Forest Farm, John Oestricher, Marengo Valley.
Fair View Farm, W. E. Smith, Highbridge.
Greendale, August C. Schmidt, Mellen.
Glenwood, Eugene Pierrelee, Mellen.
Lake Side Farm, John J. Hayden, Butternut.
Mellen Dairy, B. J. Gehrman, Mellen.
Meadowbrook Farm, Carl Grage, Mellen.
Meadow View, John M. Johnson, Marengo Valley.
Marengo River Stock Farm, Louis J. Deere, Marengo Valley.
Oak Grove, John Russell, Marengo Valley.
Poplar Grove Farm, Joseph Kreinsteiber, Highbridge.
River Side Farm, Cornielius Seiple, Mellen.
Silver Creek Farm, John N. Delfield, Highbridge.
Spring Creek Stock Farm, Ole Olson, Mineral Lake District.
Troutmere Farm, Theodore W. Werder, Marengo Valley.
Hillcrest, L. W. Krake, Glidden.
Silver Brook, Frank Faber, Mellen.
Valley View, Ed Krause, Mellen.
Morningside Dairy, E. W. Luebke, Mellen.
Poplar Grove, Dan Schrauth, Mellen.
Maple Grove, Ed Edwards, Mellen.
Marengo Stock Farm, R. C. Mallory, Marengo.
Lake View, Tom Larson, Mellen.

COMMUNITY EFFORT IN WISCONSIN.

One of the most promising signs of progress in the settlement of Upper Wisconsin is to be found in community or co-operative efforts. Movements of this sort are apparent in some form or other in nearly all of the Upper Wisconsin counties to which there has been a flow of settlers in recent years. The more extensive the settlement has been the more pronounced is the movement.

Recently the new settlers in the vicinity of Pembine, Marinette county, formed a permanent community organization with the purpose of social and agricultural betterment in their locality. The spirit which resulted in the formation of the organization was generated at a community picnic held last fall. Officers of the Pembine association were named, as follows: President, Joseph E. Dixon; vice president, John D. Roche; secretary, A. Mottard; treasurer, W. G. Burkhart.

While the organization is not formal, Cedarville, another new settlement in Marinette county, has made remarkable progress because of its community work. Although the first settler located there only in 1913, the place now has a school, postoffice, station on the main line of the Milwaukee railroad, general store and storage warehouse. Meetings are held practically every week in the schoolhouse, and community betterment is always the general topic under discussion.

Land clearing bees, ownership of stump pullers or tractors by communities rather than individuals, better social life, and more material progress are only a few of the benefits that follow community work, such as Pembine and Cedarville are carrying out.

The Pembine organization will be affiliated shortly with some national farmers' organization, such as the Grange, Society of Equity, Gleaners or Farmers' Union.

BUY CATTLE CO-OPERATIVELY.

Sec. D. S. Bullock, of the Marinette county, Wisconsin, Co-operative Cattle Buyers' Association, recently returned from southern Wisconsin with another carload of pure-bred and grade dairy cattle purchased for Marinette county farmers through the association. In all, four cars, numbering eighty head of cattle, have been purchased during the year of 1915. In addition twenty head were bought through the association in Marinette county. The banks of the county extend the funds with which the cattle are purchased, and the farmers pay it back as it is earned by the cows. The Marinette county plan has been so successful that it is now being copied in counties of Illinois, Iowa, Texas and Massachusetts.

Pick It Up and Walk Off

Did you ever see any other 8 H. P. Engine two men could carry? Cushman engines are the lightest weight farm engines in the world—easy to move around and put to work anywhere. No longer necessary to put up with old-style, back-breaking, heavy weight engines, with their violent explosions and their fast and slow speeds. The Cushman weighs only about one-fifth as much, per horsepower, but with its modern design, accurate balance and Throttle Governor, it runs much more steadily and quietly.

Cushman Light Weight Engines
40 to 60 lbs. Per Horsepower

The 4 H. P. weighs only 190 lbs. Mounted on iron truck, as shown below, it may be pulled around anywhere. Besides doing all other work, it may be attached to moving machines in the field, such as grain and corn binders, potato diggers, etc., driving the operating part and leaving the horses nothing to do but pull the machine out of gear. 8 H. P. 2-cyl. weighs only 320 pounds. Sizes up to 20 H. P. Not cheap engines, but cheap in the long run. Book free.

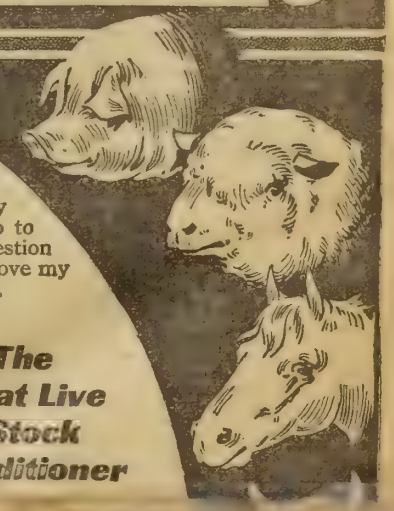
Send No Money

—In Advance on This Great 60 Days Feeding Offer



I want every farmer and stockman to see for himself, before he pays, what SAL-VET will do for his own farm animals. I want you to see how it will destroy the ravenous destructive worms that are eating the high priced feed which should go to nourish your animals—how it will stop your losses from worms—how it will aid digestion making your stock thrive better—grow faster—gain in weight and value. I want to prove my claims right on your own farm before you pay me a cent. You take no risk whatever.

The Great Worm Destroyer **SAL-VET** The Great Live Stock Conditioner

TRADE MARK
REG. U.S. PAT. OFF.

animals free access to it and THEY DOCTOR THEMSELVES. I want [illegible] stock 60 days. I want to show you results before you pay a penny. I get thousands of letters like these:

"When I began feeding SAL-VET to my pigs, they were very wormy, coughed a great deal, and some were runts. I have now fed SAL-VET for about seventy days, and I assure you these pigs look different. They are all in fine condition, and there is not a scrub in the bunch."
GEORGE THORNTON, Rt. No. 2, Brooklyn, Wis.

"Our sheep became infested with stomach worms and were dying almost daily. Reading of the remarkable cures accomplished by SAL-VET I decided to try it. Much to my surprise I have not had the loss of a single sheep since. SAL-VET does exactly as you claim."
JOHN E. TEMPLIN, Blanchester, Ohio.

(247)

Send No Money—Just the Coupon

Now fill out the coupon—tell me how many head of stock you have and I will supply you enough to last all your stock 60 days; you pay the freight charges when it arrives and feed it according to directions. If SAL-VET does not do what I claim and you make a specific report in 60 days, I'll cancel the charge; you won't owe me a penny. Address SIDNEY R. FEIL, Pres.,

THE FEIL MFG. CO., Chemists, Dept. 137, CLEVELAND, O.

Prices
Each 40 lb. pkge. $2.25
Each 100 lb. pkge. 5.10
Each 200 lb. pkge. 9.00
Each 300 lb. pkge. 13.00
500 lbs. 21.12
No orders filled for less than 40 lbs. on this 60-day trial offer. Shipments for 60 days' trial are based on 1 lb. of SAL-VET for each sheep or hog and 4 lbs for each horse or head of cattle. Thousands of dealers sell SAL-VET at above prices but in the far West and South the prices are a little higher on account of the extra freight charges.

"Last year I lost quite a number of sheep from worms. Altho I have been using the same pastures for ten years, I have lost none this year thus far, as I am feeding Sal-Vet."
Jas. B. King, Mazomanie, Wis.

"I have found Sal-Vet all you claim. My neighbor who lives within a stone's throw of my place lost several hogs from cholera, while mine are as healthy and vigorous as can be." Andrew Ireland, De Forest Wisconsin.

"Sal-Vet is all right for young pigs; I shall never again attempt to raise pigs without it." Arthur Miller, Greenwood, Wisconsin.

THE FEIL MFG. CO.
Dept. 137-1-6-16 Cleveland, Ohio
Supply me enough SAL-VET to last my stock sixty days. I agree to pay the freight, feed it as directed, and will then pay for it if it does what you claim. If it fails and I so report specifically to you, you are to cancel the charge and I will owe you nothing.

PRACTICAL POTATO HINTS.

Wisconsin Growers Tell of Their Experiences With This Important Crop—Spraying Is Declared to Be an Essential to Aid Yields and Dispel Diseases.

Practical Potato Growing Hints.

A NUMBER of farmers of Wisconsin who are specializing, some of them in a small way, in potatoes, have written letters telling of their practical experiences and giving their views on seed selection, cultivating, grading, sorting, marketing, etc. Several of these letters are given herewith and more will be published next week. Other readers of The Wisconsin Farmer are invited to join in this discussion. If you have new pictures send them in with your letters, being careful to label the picture properly with your name and address on the back. This is only one of several discussions of practical topics which have been carried on through the columns of The Wisconsin Farmer, and there will be others just as interesting and profitable to follow. In the meantime we are anxious to get letters also on any farm subject for the Farm Forum column.

Proves Spraying Pays.

To the Editor:—Our potatoes on clover sod are plowed four inches deep in the fall. I follow a four-year rotation, grain, hay two years and then potatoes. In the spring the land is double disked, crossing the furrows the first time. Then the spring-tooth harrow is used, crossing once each way. The potatoes are planted in rows thirty-two inches apart, hills about sixteen inches apart in the rows and four inches deep. Care is exercised in selecting seed potatoes of medium size and true to variety type. It is also very important to get seed free from disease. We throw out both oversized and small stuff, being confident that best yields are secured where best seed is used. In the future our plan will be to hill select at the time of digging. Potatoes are cut two eyes to the piece. After planting every effort is made to keep down the weeds. The land is dragged with a spike-toothed harrow at least twice and oftener in some seasons. We drag both lengthwise and crosswise, tipping the drag forward. We believe in plenty of cultivating and keep it up until the potatoes are in blossom. Then we hill slightly with a wing-shovel plow. Experience has taught us that hilling not only keeps some potatoes from getting green but also makes digging with the digger much easier. For this county I believe the earlier potatoes are planted the better, from May 10th to 20th being preferred. When potatoes are planted late I find that in the average season they are often unripe at digging time and skin badly. In fighting bugs I have used successfully a spray mixture made of two tablespoonfuls of arsenate of lead and one of Paris green to two gallons of water. This is used in the knapsack type of sprayer. The arsenate of lead is a good sticker, but does not kill quite as rapidly as Paris green.

The past summer in co-operation with our county agricultural representative a very convincing demonstration was conducted on my farm. I had never sprayed with Bordeaux mixture for blight. As a matter of fact, I didn't think there was much to it. But this summer's experience fully convinced me that it was worth while. Potatoes were sprayed three times at ten-day intervals, beginning August 1st. A noticeable difference could be seen in the appearance of the vines as the season advanced. The rows sprayed with Bordeaux were more thrifty looking and growthy than those unsprayed. Care was taken when spraying to keep the pressure high in the tank and also to get the spray material on all portions of the vines, the under side as well as the upper. This we were advised was very important. To prove the value of spraying a certain number of rows were sprayed and an equal number left unsprayed. At digging time the potatoes were carefully weighed. The three sprayed rows yielded 11.1 bushels and the three unsprayed rows yielded 7.66 bushels. The acre yield for sprayed portion was 172 bushels and the acre yield of the unsprayed portion was 118¼ bushels. This is a gain in favor of spraying of 53¾ bushels to the acre. At 60 cents per bushel, the present price on our local market, the spraying was worth $32.25 an acre to us. The expense of spraying materials was as follows:

Blue vitriol	$2.00
Lime	.20
Total	$2.20

This left a balance in favor of spraying of $30.05 per acre. The picture sent herewith shows the yield from sprayed and unsprayed rows, the sprayed rows on the right and the unsprayed rows on the left.

George Keech.

Langlade Co., Wisconsin.

PROOF THAT SPRAYING PAYS.

Produce of three unsprayed rows at left. Three rows sprayed with Bordeaux mixture produced the six big sacks at the right.

Less Acres and Larger Yields.

To the Editor:—One of the pictures enclosed is a view from my field of Rural New Yorkers. My Rurals from this field took seventh place out of sixty-three entries in the individual class at the Marinette Potato Show, held last November. This field was broken three years ago and potatoes planted on breaking, then seeded to oats and sixteen pounds of a mixture including six pounds red clover, five pounds alfalfa, two pounds alsike and three pounds of timothy seed per acre. This seed came up very nicely and about May 28th was plowed under. The ground then was disked four times and dragged twice with a smoothing harrow, and about June 10th (a little late I admit, but I waited to get all the green clover I possibly could to turn under) the seed potatoes were planted with a potato planter and about 600 pounds of 2-8-10 fertilizer was drilled in. While the yield was not large, the potatoes were very nice and smooth and of even size and fine texture. My seed potatoes were rather large and I cut off and discarded the stem end on most of the potatoes. I think this will be practiced more as we gain more experience. Hill selection and an acre plat for seed potatoes are absolutely necessary for better potatoes. My motto is "Less acres and larger yields."

My other photograph was taken in a field of Triumphs last August, planted six weeks. On the night after the picture was taken the vines were frozen to the ground. The land was broken the year before. It is muck land and very soft and hard to get the proper drainage, as the land lying in front of it is undeveloped, at least part of it, and owners cannot agree on draining. I have a small ditch and if the other property owners do not open it up will try to pump the water out. On this muck land a 1-8-10 fertilizer was used and if we had not had frost so early we would have raised a good crop. The seed used on this land was small potatoes. This is bad in one way, but it insures a good stand, as whole potatoes will not rot in wet soil as cut ones do. These were also planted with a planter and when the disk threw up the soil to cover it was left that way to give better drainage. We had a nice stand even in the spots where we could not ride on the planter, as both the planter and horses would mire. The ground, however, was free from weeds, otherwise there would be too much work with the hoe to keep them clean.

I am vitally interested in the improvement of farm products both as a grower and shipper. I was born on a farm in Denmark and came to this country and Waupaca county twenty-eight years ago. I was then fourteen years of age. I worked on my father's farm near Waupaca for twelve years. At that time there was some talk, as there is now, about the middlemen's profits and the problems of marketing our products at a price nearer what the consumer pays, taking into consideration, of course, the cost of transportation, handling, wholesalers and retailers' profits. We heard that the farmer got 30 cents a bushel for potatoes for which his relatives in Chicago paid 90 cents or 25 cents a peck which would be $1 a bushel, or 2 cents a pound which would be $1.20 per bushel. According to these reports, middlemen were getting rich without doing any real work. In listening to these arguments I decided to do some investigation on my own hook. It is a long story, some sixteen years of it which I might tell at some other time, and still there are a lot of things to overcome and learn. I realize that we are far from marketing our farm products the most economical way, in spite of the big farmers' organizations and the marketing organizations at the other end of the line. The chief drawbacks are waste and service—waste with the produce and service given the customer.

C. N. Christensen.

Waupaca Co., Wisconsin.

FIELD OF RURAL NEW YORKERS.

Potatoes from this field on the Christensen farm, Waupaca county, won seventh place at Wisconsin Potato Show in individual class of sixty-three entries.

FROST GOT THESE TRIUMPHS.

After six weeks this field of Triumphs on the Christensen farm looked very promising, but frost killed all the vines and cut down the yield.

Important to Wisconsin Growers.

To the Editor:—The past year has been full of disappointment to the potato growers here, and, as I learn, to many of the northern growers. With a cold, wet, backward summer we had also to contend with the many diseases which have come up in our fields. These included leaf roll, blackleg, Rizoctonia, early and late blight, to say nothing of the common scab. Although the most of these diseases may be prevented in a large measure it seems the growers are slow to take advantage of the remedies. This is

partly due to ignorance of the diseases and the remedies therefor, but I believe more from the fact that in the past we have been able to raise fairly successful crops without resorting to control measures. The growers are not very willing to add further burdens to their already arduous duties. The few years just past seem to point to the necessity of concerted action throughout the state looking to the eradication of diseases and also toward the standardization of varieties in Wisconsin. Potatoes are Wisconsin's main cash crop and they fit in very nicely with our big dairying industry.

I believe it possible for Wisconsin to produce the very best quality of potatoes and with regret I look at the market quotations where our neighbors are receiving from 2 to 10 cents a bushel more for their stock than we are getting here. There must be a reason. I believe one of the main reasons is the large number of varieties and the poor qualities of many of these varieties. Many of our growers are raising two varieties, one for their own table and another for the market, and I shall expect them to continue to do so until the potato market is governed by quality instead of the number of bushels per acre. A farmer cannot be expected to plant something that promises an inferior yield unless he is assured a better market price per bushel. I believe our state is taking a long stride forward in the matter of seed certification, although this matter is as yet in its infancy. It seems to me that in local co-operation, a try-out of the several standard varieties, strict adherance to these varieties and a determined effort to stamp out disease lies the improvement of our potato industry in Wisconsin.

John T. Somers.
Barron Co., Wisconsin.

Taylor County Man's Views.

To the Editor:—The potato subject is somewhat aggravating at times, more so than it is possible to give in detail. I would advise every farmer to select his seed potatoes in the fall and to choose only those free from disease, true to type and medium size. Practice seed selection on the field every fall. Never plant potatoes twice on the small plot of ground, for if you do you may expect ill-shaped, diseased stock and about half a crop.

In the spring see to it that your potatoes are a trifle sprouted before cutting begins. You may wonder why, but there is one advantage to be gained and that is you have an opportunity to discard potatoes which do not show a strong and vigorous sprout. If your field conditions are not exactly perfect the tiny sprouts may never come up after they are in the ground. And even if it does the tuber which it produces is not likely to be a marketable one. Have a good-sized plant with at least two strong and vigorous sprouts.

The soil should be a clover sod turned in the fall. There should be a liberal amount of manure applied before disking. Have the ground prepared two weeks before you plan to put in your seed. This tilting the soil before planting will not only make the soil mellow but will kill millions of weeds and last, but not least, will let in the sunbeam to warm up the soil.

I do not plant very deep for our rain period usually causes the soil to pack too hard, thus keeping the seed too cold. When it dries up nicely after a rain we take a peg-tooth harrow and bring the hills to a nice mulch. A mulch between the hills at all times is advantageous and will stop the evaporation of moisture and I believe in hilling the plants even when in full bloom. By this time the weeds will be overcome by cultivation.

Frank Halopka.
Taylor Co., Wisconsin.

Selection of Seed Potatoes.

To the Editor:—Potatoes must not be allowed to overgrow before being hilled. They must be cultivated at least four times and should be hilled before they are blossomed out. They should not be touched when blossoming. They should be sprayed for bugs if there are too many, but not too strong, at least not so they will be burned. They should be picked over before blossoming time to see whether there are any stray varieties or diseases in them. The bad vines should be picked out and destroyed. If a man wants pure-bred seed he should never put any two varieties close to each other. There are many diseases which I have given study on my own place and at other farmers' patches where I have helped to pick potatoes. They include silver scurf, which shows small black spots. When scraped off it shows a silverish color. Then there is the root rot where the vines rot off between the potato and the vines outside. Then there is another disease where the whole stem turns yellow and in a short time dies away. And the little potatoes also rot. Then there is the early and late blight which must be looked out for. In the late blight part of the vine turns a blackish color like it had been frozen. This blight goes from the leaf through the stem, then to the potato in the ground. In about two weeks it will destroy the whole plant. We have gotten into the practice of sorting our potatoes in the field. We sort to get rid of the little fellows and culls and decayed ones. Blight must be killed with Bordeaux mixture. Now I must tell you what I know of the shape of the Rural New Yorkers, color of the vine and blossom. The blossom is of a purplish color. The vine is stout and a very dark green color and does not grow into a large cluster. The potato itself should be of a flat, oval shape and the ends must be a little more nearly square. The potatoes for seed should be cut through the seed end, so as to divide it equally. Each seed should have at least two eyes. A seed potato should never be cut through the eye. A potato that weighs from ten to twelve ounces is the largest fit for seed. These large potatoes must be cut into three to four parts. A potato should have a sort of hairy and fine, glossy skin and not a shiny and glassy skin. Such potatoes must only be selected for seed.

BIG MONEY RUNNING A WAGON DRUG STORE

If you are sober, industrious, honest, reliable and can furnish a team or auto, you're just the man we're looking for to conduct with our capital, this wonderfully profitable business of running a Wagon Drug Store—selling a big, modern line of Sanitary Medicines, Toilet Goods, Perfumes, Spices, Extracts, Stock Remedies, etc., direct to farmers and homes. You don't need to be a registered druggist or know anything about the drug business. Experience in selling goods not necessary. We instruct you how to earn, clear of all expenses, from

$100 TO $150 PER MONTH

Right from the start! Easy then, to build up a business of from $2,000 to $4,000 a year net profits. Our selling plan is different from all others—wipes out all competition. We have a **big** line—nearly 100 different articles easy to sell—give such splendid satisfaction you can sell to same customers month after month. You don't need to be a salesman—simply leave the articles at homes, also some free samples. Ours is the simplest, easiest and most remarkable way to sell practically every house its entire supplies ever devised. People buy gladly because they find each and every article far superior to others and prices the most reasonable. Ours is the **only** company that makes up samples to leave at the homes with the goods, so customers can try samples first and be convinced that our goods are best.

We manufacture our preparations from tried and proven formulas, pure materials of the very best. Our laboratory is in charge of a Graduate Chemist and Doctor of Pharmacy with over fifteen years practical experience. Every preparation bearing our name is not only guaranteed to comply with the Pure Food Laws, but is the best of its kind that can be produced by science, experience and honest methods.

No Capital Required

A team and wagon or auto your only investment. If you have a team, or can get one, we will supply you with a dandy wagon, made especially for the business, at bed rock factory cost and on easy terms. We will also supply you, at lowest wholesale prices, with a $500 to $3,000 stock of goods on credit. We won't charge you a cent of interest and you can pay us as your customers pay you, keeping a liberal share of the proceeds each week for yourself.

We give our salesmen the **squarest deal** you ever heard of. We are leaders in quality—low prices and unequaled selling plan. Coupon brings ample proof.

Pleasant, Healthful Outdoor Work

It's mighty pleasant, healthful work, running a Wagon Drug Store! Keeps you out in the fresh air and sunshine, meeting people and forming lasting friendships. Already more than 20,000 of these wagon stores are doing big business all over the U. S. and every day sees more and more ambitious men who have grown tired of hard work and small pay embarking in this independent business where every man is his own boss and his income limited, only by his own efforts.

Exclusive Territory Act quickly and we can give you exclusive territory if you will work it thoroughly and treat your customers right. You can make it worth thousands of dollars and are privileged to sell it if you ever want to go into any other line.

OUR DAIRY DEPARTMENT

ALL communications relating to dairy matters should be addressed to this office. Inquiries of general interest regarding dairy management and production will be promptly answered.

GOOD PRODUCERS WERE ALL FED GRAIN.

The value of proper feeding in securing good production is brought out in the October report of the Langlade County Cow-Testing Association. During this month the Jerseys led in the forty pound list and it can be said that this county boasts of some very fine herds of Jerseys.

Out of sixteen cows in the forty-pound list, thirteen were Jerseys, one of the number a five year old owned by Harry Guenthner, producing sixty-one pounds of fat, from 1,131 pounds of milk.

The milk production of these thirteen varied from 515 to 1,131 pounds and the butter fat from 40.6 to sixty-one pounds. If perchance one farmer had been fortunate to own the thirteen his cream check for the month at present prices for butter would have been $207.80, a snug little sum from so small a herd. In addition the skim milk from the above cows at 25 cents per hundred would have brought $21.15, making the total $228.85.

A study of the list reveals that the owners of the forty-pound cows have for years been using pure-bred sires, proof that their high poducing animals are not accidents. but the result of careful methods of breeding.

The value of right feeding also enters for the men with the forty-pound cows are also good feeders. Grain forms a part of the ration on each of the farms. Harry Guenthner is feeding clover silage, clover hay and ground oats. Finding his cows are losing flesh on this, he plans to add a third ground corn to the grain ration. Mr. Ings is feeding ground barley and oats about half and half, with clover hay. As soon as available he will get pea-vine silage. He admits that his cows, though doing well, are not producing as heavily as if they were getting some silage.

More and more Langlade county dairymen are coming to recognize the importance of feeding the balanced ration to get best returns.

HARRY GUENTHNER.

YEARS OF TESTING.

The report of the official tester of the Dunn County Cow-Testing Association No. 1 shows that during the past year five herds averaged better than 340 pounds of fat, the average for the best five herds being 355 pounds with an average profit of $69.60. The poorest three herds under test averaged 117 pounds of fat with an average profit of $28.75.

Charles Harshman's herd averaged 373 pounds of butter fat per cow; Roach Bros.' herd 357 pounds; Sam Ausman's herd 349 pounds; Alvin Webert's herd 348 pounds and John M. Cramer's herd 340 pounds.

The report for the last month of cows which produced more than forty pounds of fat follows:

Skyscrapers and Silos

The tallest office building in the world is the Woolworth Building, New York City. It is 55 stories high, cost $7,500,000, and is fireproofed with over 30,000 tons of NATCO Hollow Tile. Safe against fire, wind pressure and shock and built for all time, it is a lesson to *you*, Mr. Farmer, when figuring on a silo and other farm buildings. The same material with which we have fireproofed the majority of skyscrapers of North America is being used extensively for the construction of the NATCO Imperishable Silo and all other types of farm buildings. For permanency, service and economy

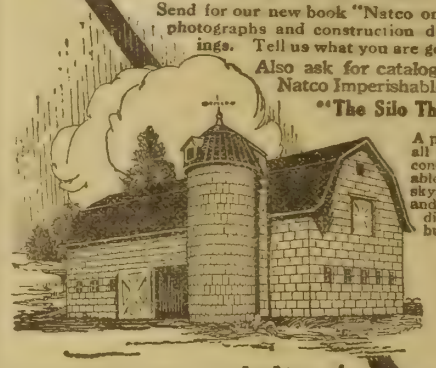
Build With Natco Hollow Tile

Best for the city and best for the farm. NATCO buildings are weather proof, decayproof, fireproof and frost-resisting. They are attractive, too—buildings you'll be proud of.

Send for our new book "Natco on the Farm." Fully illustrated from photographs and construction details of all types of farm buildings. Tell us what you are going to build.

Also ask for catalog describing the ever popular Natco Imperishable Silo—

"The Silo That Lasts For Generations"



A perfect ensilage preserver in all parts, through all weather conditions. Handsome, durable, convenient is "the skyscraper of the farm" and a most valuable addition to your farm buildings.

Natco Silo Wall Note perforated shell providing firm anchorage for mortar joints

Tell us what you are thinking of building. We have plans for barns, corn cribs, garages, etc. free.

P. B. Van Horns, Tester.

THE DAIRY COW THE SETTLERS' OPPORTUNITY.

To the Editor:—Every year there are hundreds of farmers coming into Wisconsin from the states of Illinois and Iowa where land is high in price, to settle upon the cheap land in the northern part of the state. In many cases these farmers have but limited means and must start their farming in a very modest way.

To these men opportunity knocks not only once but is fairly calling to them through the voice of the dairy cow. She is the one sure road to success. It is possible to start with but little capital and in a few years build up a herd of cows that will be real money-makers.

There are many examples of this in Wisconsin. I know one farmer that started about fifteen years ago on a mortgaged farm. Now he has a fine farm valued at $30,000. And he has done it with the aid of the dairy cow. His success is typical of many others.

In dairying there is no large outlay of capital, and money is coming in regular through the sale of dairy products. This has many advantages over grain raising or beef raising, to the man with small capital. Also it solves the question of fertility, which is too important to be overlooked.

Of course, dairying is not a sure means to riches to anyone who can buy a cow, but to the man who will give dairying careful attention, it offers a good living. It will make any man's farming a success who keeps the best kind of cows in the right way.

Did you ever stop to think that the dairy farmer does not need as much land as the farmer who grows grain for a living? The grain grower is doing well if he gets $20 an acre. The dairyman can make three times that amount from an acre under average conditions.

Alfalfa and the modern silo have done more to make dairying a profitable business than any other thing. They have cheapened the cost of milk production until today dairying is the best paying branch of agriculture. The man who does not grow alfalfa and feed silage is miles behind his progressive neighbor who does. Also he almost always owns an automobile first.

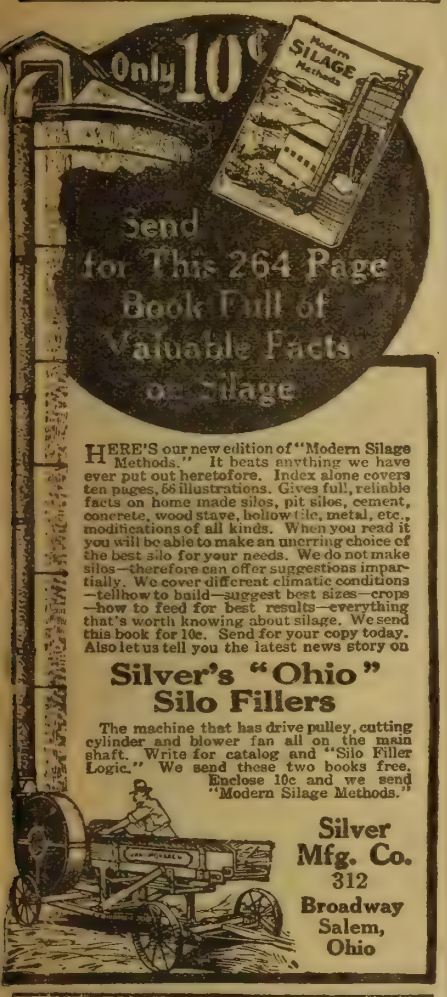
Wisconsin is a land filled with opportunity. There is no place where brains and muscle will win as much. Thousands of settlers who have become prosperous farmers are proof of this. There is room for many more and he should adopt this quaint bit of verse, familiar to us all as his motto. And may the singing of it bring him success in his battle for a home.

A little farm well tilled,
A dairy cow well filled,
A hearty farmer well willed.

Bernard E. Coffin.

The second annual convention of the Minnesota Cheesemakers will be held in Pine Island, Minnesota, February 8th. John J. Roch, of Zumbrota, is chairman.

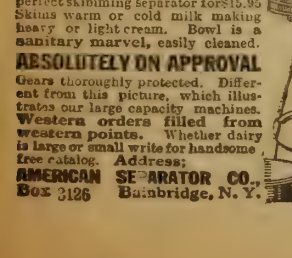
Farmers' Week at Madison, February 7th to 12th, will probably be the most complete in the history of the state. Farmers and others interested in farms will do well to attend these meetings.



HERE'S our new edition of "Modern Silage Methods." It beats anything we have ever put out heretofore. Index alone covers ten pages, 56 illustrations. Gives full, reliable facts on home made silos, pit silos, cement, concrete, wood stave, hollow tile, metal, etc., modifications of all kinds. When you read it you will be able to make an unerring choice of the best silo for your needs. We do not make silos—therefore can offer suggestions impartially. We cover different climatic conditions—tell how to build—suggest best sizes—crops—how to feed for best results—everything that's worth knowing about silage. We send this book for 10c. Send for your copy today. Also let us tell you the latest news story on

Silver's "Ohio" Silo Fillers

The machine that has drive pulley, cutting cylinder and blower fan all on the main shaft. Write for catalog and "Silo Filler Logic." We send these two books free. Enclose 10c and we send "Modern Silage Methods."



Silver Mfg. Co.
312 Broadway
Salem, Ohio

Br-r-r

No matter how cold it gets outside, your silage is safe if it's inside the

B. V. T. Silo

Dead air is the best insulation against frost. The B.V.T.'s three dead air spaces keep Jack Frost away from silage. Note the tile. Large middle spaces hold lots of dead air. Narrow outside spaces are plugged at both ends of tile by mortar joint. Sealed absolutely air-tight and forming strong tongue-and-groove joint. Nothing like it in any other tile. It's patented. Why the B.V.T. Silo is the strongest, most permanent and most efficient silo fully explained and illustrated in our Silo Book E. Send for it.

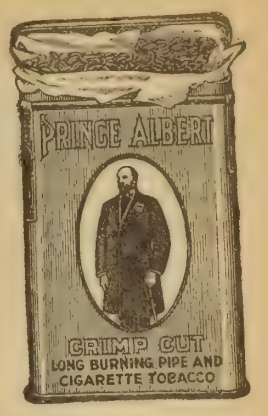
Prince Albert paves the way



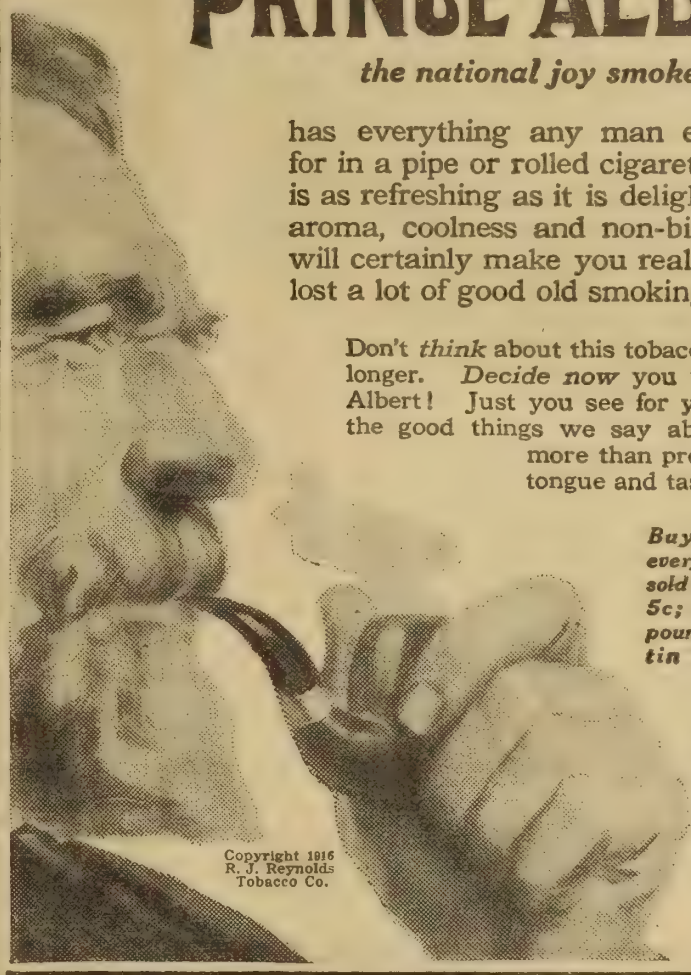
for men to get a new and cheerful understanding of how good a pipe or rolled cigarette can be. If you *think* you can't smoke a pipe or a makin's cigarette; if you are taste-tired, we tell you Prince Albert will bring you back without any fuss or feathers—quick! The patented process fixes that—and cuts out bite and parch!

PRINCE ALBERT

the national joy smoke

has everything any man ever yearned for in a pipe or rolled cigarette. Its flavor is as refreshing as it is delightful; and its aroma, coolness and non-biting qualities will certainly make you realize you have lost a lot of good old smoking time!

Don't *think* about this tobacco question any longer. *Decide now* you will try Prince Albert! Just you see for yourself that all the good things we say about P. A. will more than prove out to your tongue and taste!



Copyright 1916 R. J. Reynolds Tobacco Co.

Buy Prince Albert everywhere tobacco is sold in toppy red bags, 5c; tidy red tins, 10c; pound and half-pound tin humidors and in that classy pound crystal-glass humidor with sponge-moistener top that keeps the tobacco in such fine trim.

Auto, Farm Engine and Farm Machinery Ailments diagnosed and remedies suggested in this department

QUESTIONS AND ANSWERS.

Rewinding Magneto.

I have a Splitdorf low-tension magneto. Can it be rewound so as to make a high tension magneto out of it?

Answer.—It cannot.

The Sleeve Valve Motor.

What are the advantages or disadvantages of the sleeve valve motor compared with the poppet valve type?

Answer.—The advantages are freedom from noise, a quick opening and closing of the intake and exhaust ports, less liability to carbon trouble and several other minor features tending to make a quiet and efficient motor. The chief disadvantage is the cost.

Lights from Ford Magneto.

Would it hurt a 1912 Ford touring car to run lights from the magneto? If so, in what way? What should be the voltage of the lights?

Answer. — The Ford Company is strictly opposed to the idea of running lights from the magneto on cars built previous to November, 1914. They claim that what extra power the magneto has should be kept in reserve for ignition purposes. Many owners are operating lights from the magneto without serious results. Six volts, ten candle power lights are used.

Cylinder Types.

What are the advantages or disadvantages of casting cylinders single, in pairs or en bloc?

Answer.—It is less expensive to replace a single cylinder when worn or scored than to replace all of them, as must be done if the cylinders are cast en bloc. However, cylinders cast en bloc greatly strengthen the crank case, preventing springing of the crank shaft, thereby making the bearings wear longer. The cylinders cast in pairs are more easily cast and less expensive to replace than cylinders en bloc, but they have comparatively little stiffening effect upon the crank case.

Running Feed Grinder with Auto.

I have a twenty-two-horse-power Metz roadster in good condition. How large a feed grinder would this engine run? Could I use the self starter sprocket wheel to drive with? How large would the grinder pulley have to be? Would the same size chain used on the starter be strong enough?

Answer.—Your engine should run successfully any feed grinder that does not require more than twelve horse power. We would not advise you to drive the grinder by a chain from the starting sprocket. It would be better to mount a jack shaft under a platform, the jack shaft being provided with a belt pulley and also two wide-face pulleys, the same distance apart as the rear wheels of the auto. Drive the jack shaft by allowing the rear wheels of the auto to rest upon the pulleys, blocking the front end of the car securely. The driving pulleys should be about the same diameter as the auto wheels, and the belt pulley about eight inches in diameter and six or eight inches in diameter of the grinder pulley in inches, divide 2800 by the R. P. M. the grinder pulley should make.

Automobile Drive Shafts.

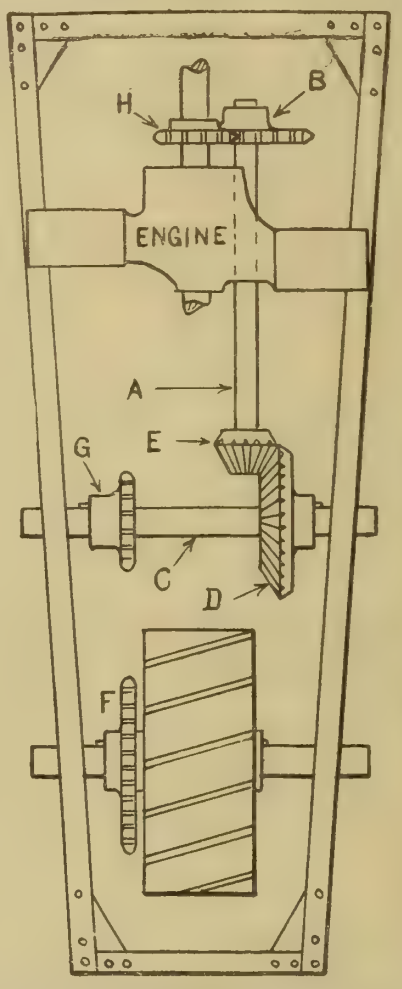
What resists the twisting action on the rear axle housing when the brakes are applied? I notice on some cars that the lower half of the springs have backward and forward play; therefore, it seems to me that all of the strain is on the driving axle. Is more than one universal joint necessary if the transmission gears are at the rear axle? I know of one car having three universal joints, the gears being under the front seat. It is a "three unit" system. Is there any desirable advantage in this?

Answer.—The twisting action when the brakes are applied is taken by the driving axle housing, often called a "radius tube" or "torsion tube." Only one universal joint is necessary when the transmission is on the rear axle. There is no advantage in a three-unit system. The general trend of opinion favors the unit power plant, combining engine and transmission in one unit. However, this is largely a manufacturer's problem, the purchaser being little affected if the details of the design are well worked out.

The Buick Tractor.

In your last issue I saw where a man wanted to make a tractor out of an old Model F Buick. I have made a three-wheel tractor of this kind, using an old header wheel, sprockets and chain and a Buick engine and transmission mounted crosswise of the frame. I would call it a success on level land, but it is not balanced right for hilly ground where there are ditches to cross. I might improve mine by making it shorter—setting the front wheels back—and adding extra weight to the rear. I enclose a sketch of my machine.

Answer.—We much appreciate the above letter, also the letter following. It is very interesting and instructive to see what has been actually done



and what results have been obtained. The sketch of the above machine is shown in the figure. It is simple and well arranged. The engine is mounted across the frame, the transmission side toward the front. A shaft, A, is mounted under the engine. Sprocket B is keyed to this shaft, B being driven from the transmission sprocket H. Shaft C is driven by shaft A through the bevel gears D and E. The drive wheel sprocket F is driven by a chain from sprocket G on shaft C. No differential is required, as there is only one drive wheel. Sprocket B is the sprocket used on the Buick differential. The bevel gears have a two to one reduction.

Another Tractor.

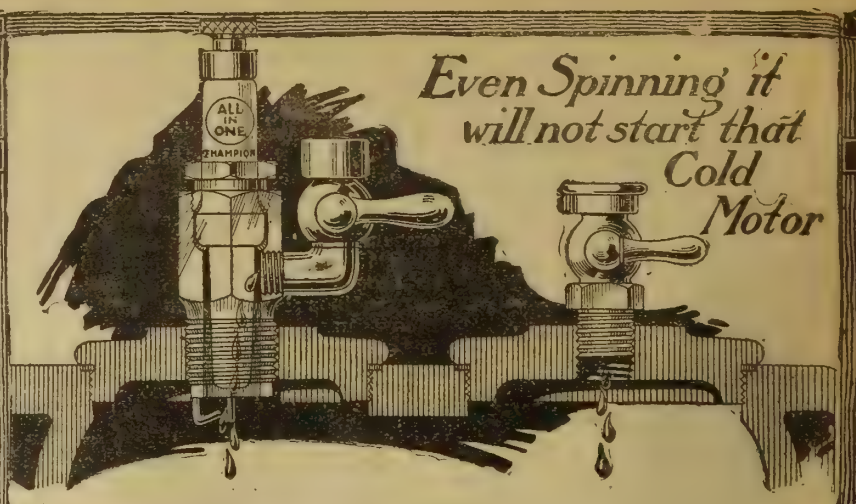
Along in the early summer I wrote you in regard to making a tractor of a Cartercar auto. Your reply was in one of the August numbers. I have just got the machine put together and am trying it out. It is surprising what it will pull. The only thing seriously wrong is that it is so light in front that it steers hard under load. It weighs 2,160 pounds. It will probably have to add dead weight as far ahead as possible. My idea is to carry considerable water for cooling in addition to the radiator, and set the gasoline tank by the engine, as near the carburetor as possible. Ahead of the radiator I will also place a box into which I can shovel dirt if necessary to hold it down. I intend to begin hauling oats with my rig in a day or two if the roads continue good. I expect to haul three wagons easily at four miles per hour. My rig has cost me $150. I am using cast chain and sprockets at present. It would probably pay me to put on steel sprockets and roller chain at an expense of $75 additional. My drive wheels are forty-eight inches in diameter. The gear ratio is 28 to 1.

Answer.—This letter contains some very good suggestions. We have no doubt but that much useful work will be done by the tractor.

The Motor Sleigh.

I am thinking of making a motor sled, using four runners; also two wheels thirty inches high with lugs on them to run in the snow. It weighs 600 pounds. Would a one and one-half horse power engine pull it? Do you think it is practical? What speed would it travel if the engine makes 750 revolutions per minute?

Answer.—We rather doubt that this idea is practical. Even if this sort of drive is practical for a sleigh, the engine should have not less than four horse power; eight would be better. With a six-to-one gear reduction between the engine and drive wheel, the sleigh would travel about ten miles per hour.



Even Spinning it will not start that Cold Motor

—not if it's a really cold day.

Not even if you prime through the priming cup or by removing the plugs.

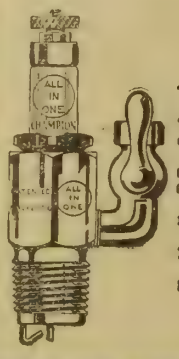
But there is a sure way.

Tho' gasoline will not vaporize fast enough in a cold cylinder to spread across the combustion chamber—to reach the ignition point—

You can put it *right at the spark gap* of an

"All-in-One" Champion Priming Plug

"TOLEDO MADE FOR THE WHOLE WORLD'S TRADE"



That's the sure way.

No need to prime and prime again in the old way—no need to freeze your fingers—no need to lose time.

The All-in-One Champion is a combination spark plug and priming cup. The gasoline runsdown through the center of the plug and actually collects on the electrodes—right where the spark flashes.

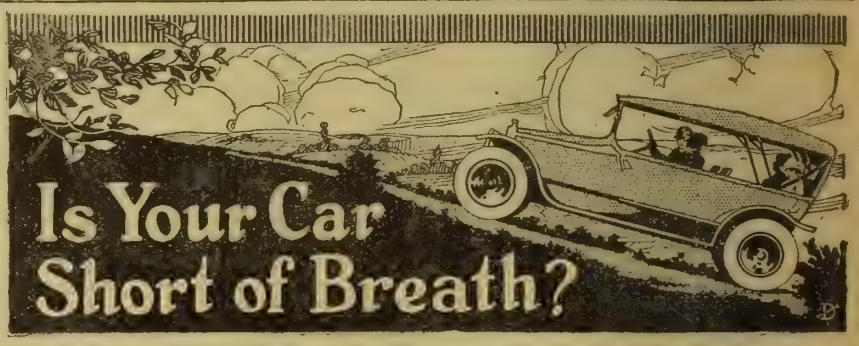
It spreads around the rim and entirely surrounds the spark gap with a cloud of rich vapor, so when the *first spark* jumps, there's an explosion—and your motor starts, every time.

Get a set today and assure the *instant* service of your automobile, regardless of the weather.

Your dealer will supply you with the kind especially designed to serve your motor. The price is $1.25 each.

The name "Champion" on the porcelain—not just on the box—is your guarantee of spark plug dependability.

Champion Spark Plug Company,
502 Avondale Avenue Toledo, Ohio



Is Your Car Short of Breath?

Pants up hills—lags on the level—eats up gasoline—always a tail-ender. That's a sign that the piston rings in the motor are worn out and the compression is weak. You can cure the trouble by installing

McQUAY-NORRIS **LEAK-PROOF PISTON RINGS**

LEAK-PROOF Rings will stop those compression losses and restore the full power of the motor. And they'll keep it free from carbon—make it run sweet and true. They save gasoline and oil, reduce motor wear and last as long as the motor.

LEAK-PROOF Piston Rings are made in all sizes—easily installed. You can get them from your supply dealer. If he hasn't them—write us, giving his name. We'll see that you are supplied.

McQuay-Norris Mfg. Co., 2820 Locust St., St. Louis, Mo.

Send for FREE booklet—"To Have and to Hold Power." It tells all about compression and what LEAK-PROOF efficiency means.

Fruits and Garden

THE KEIFER PEAR.

The Keifer pear can be grown successfully and is well worth growing. It is adapted to a wide range of country extending far north of the habitat of the bulk of pear varieties. Its hardiness of tree and vigor of growth make it a conspicuous object in northern orchards.

The Keifer sometimes blights, especially if grown upon rich manured soils. So it is advisable to plant upon poor soils and after the trees are well started do not cultivate. It is so vigorous that it needs no stimulants in the way of culture and enrichment.

Fruiting begins at about the tenth year and crops will be more prolific if other varieties are set with it, for its bloom is not well supplied with pollen. Blight will often strike the trees after they have borne a few crops, especially if they are crowded and have poor air circulation. The best location for the trees is upon high land.

But even if blight comes so that some trees die plant two more for every one you lose. It is common to see old trees which are half dead—or more, and the few living branches will be loaded with fine pears. It is not advisable to cut an old tree even if its looks are disreputable.

As is well known, the Keifer is not an early pear, not meant for summer use, and therein is its chief value. It will keep and be useful in early winter. There was never yet a Keifer grown in this latitude and fit to eat or use at time of gathering. The fruit is to be picked about mid October before there comes a heavy freeze. Put it at once in piles of five or six bushels either on the barn floor or along side of a haystack. Then cover with a foot of straw or several old blankets. This is needed because they mellow up much better if kept in the dark. After two or three weeks sort them over and pick out the ones which have turned yellow. These will be found in fine condition for cooking or table use. And they will be just right for marketing if you have a surplus.

There is nothing good about a Keifer when it is green and hard. It is then no better than a green peach—as unpalatable and worthless as anything which can be named. But as they ripen there is a marvelous change. They become mellow and rich. Not as good as first-class pears growing on southern trees, too tender for our rigid clime, but they are good enough for a desert fruit, appreciated by all the family and especially by the kids.

Sometimes there is a little sandiness about the core, but the Keifer is all right. A store of them may be kept and serve the family for every meal from November 1st to Christmas.

Every farm home should have a dozen pear trees about it and if the reliability of the Keifer were better understood they would have them. It is a pity to see so many people going without this important fruit when they can be grown at a cost of 25 cents per bushel.

It is not necessary to pay more than 10 cents each for thrifty two-year-old trees and any homemaker who will plant and protect them will live to thank his friends for the hint.

THE PROGRESSIVE STRAWBERRY.

Among the many varieties of the fall or everbearing strawberries the Progressive is by far the favorite with those who have had the most experience. It has the following good qualities to recommend it: The fruit is large and is borne in profusion; it is a good plant maker and as hardy as any variety. The berry is good in quality and ripens evenly. The color is a dark red and the deep-set seeds make the surface look wrinkled, quite in contrast with those varieties which have a perfectly smooth and varnished surface.

The form of this berry is not round, but rather triangular. The fruit stems are of moderate length, but not strong enough to hold up the heavy bunch of berries, so perhaps mulching will always be advisable.

It is needless to add that the yield of fruit is very large. Mr. Clarence Wedge, of Minnesota, than whom there is no better authority, tells of what he did with one square rod of this berry. The plants were set May 1st, ten by twenty inches. He cultivated carefully and cut all bloom and runners until July. Then during the drouth and heat of that month he irrigated the patch thoroughly five times. He began to pick fruit about July 20th. The berries were weighed carefully each picking until the close of the season in October. And the total was 1,345 ounces, or seventy-four quarts, allowing eighteen ounces to a dry measure quart.

It was a total of two and one-third bushels and an average of one quart per day for the picking season. And note this result was obtained the same season that the plants were set.

Picking began in about fifty days after planting. As a rule, we plant berries in April and we have to wait over 400 days to get a crop. Even a cross-eyed man can see some advantage in this.

But this is not the end of it, for after the first crop if the runners are encouraged in the fall the bed will be in splendid shape for the second crop beginning the following June. And with favorable conditions the second crop will be double the first. With proper care this berry will certainly produce enormous crops in July, August and September. In some seasons watering will be necessary, because in those months we usually get our dry times.

This much may be said with certainty: Every family, that is, every country family, can provide itself with strawberries for every day in the summer and fall up to the time of heavy frosts.

The question occurs, will it be possible to make a commercial success with this berry? At the rate of yield named above an acre would produce over 10,000 quarts, and sold at the moderate price of 12½ cents would yield a total of over $250. And that is the first of planting. The second year with good care the yield would easily be doubled.

It is doubtful if very high prices can be obtained as a rule, because fall berries will be in competition with grapes, peaches and other fruits.

Still, there are many people who are so exceedingly fond of strawberries that they will buy them at any time.

You Can Depend On These Brands

NORTHRUP, KING & CO.'S SEEDS

FOR over 30 years we have been growing and selling seeds suitable for northern conditions. Our reputation for supplying seeds of fine quality, strong germination and high purity, together with a policy of square dealing, has built up a constantly increasing volume of business.

To protect our customers and the high reputation of our seeds, the word "Sterling" to designate the very best obtainable in seeds, was adopted several years ago as a trade mark. We now offer two new brands, for which trade marks have been registered in the United States Patent Office at Washington. Our customers may always depend on these three brands being uniform in quality and up to the standard set for each.

What Our Three Brands Stand For

"Sterling Brand" Seeds For those who want the best. Unexcelled for purity, germination, plumpness and color. Sold only in sealed bags. LOOK FOR THE STERLING TRADE-MARK.

"Northland Brand" Seeds The greatest value for a reasonable price, of uniformly superior quality, carefully selected for high purity and strong germination. THE NORTHLAND GOOSE IS ON EVERY BAG.

"Viking Brand" Seeds Lowest in price, consistent with dependable quality. Strictly recleaned and tested for purity and germination. EVERY BAG BRANDED WITH THE VIKING SHIP.

32nd Annual Catalogue

This is the best book we have ever issued. It has been enlarged by the addition of many new varieties, illustrations and cultural directions. Every seed user will find it valuable, as it contains practical ideas and suggestions for the garden, farm and lawn.

A copy will be mailed you free, upon request.

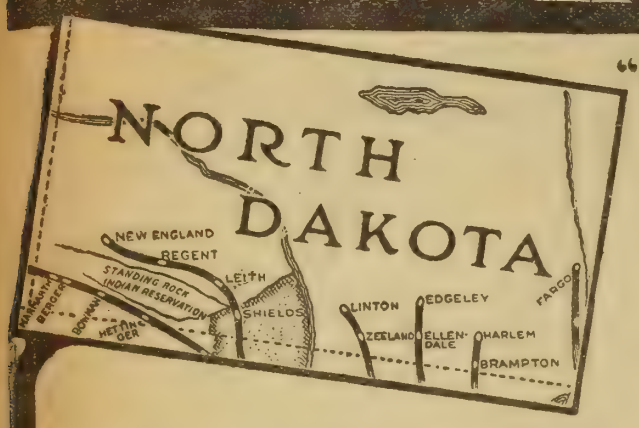
Sold by 15,000 Dealers

In nearly every community in the Northwest there is a dealer who sells our seeds. This wide distribution makes it easy for every planter to buy Northrup, King & Co.'s tested seeds. Your dealer will take your order for any variety of seed you want.

We have arranged to ship orders immediately to dealers so you will be caused neither inconvenience nor delay. Order early.

NORTHRUP, KING & CO., Seedsmen. Hennepin Ave. at First St. Minneapolis, Minn.

North Dakota



"No Better Place than this to Build a Home"

That is the opinion of Mr. Harley Jennings, a Minnesota man, who moved to North Dakota in 1907, filing on Government land. He has been engaged in farming and stock raising ever since.

"Splendid future as a stock and farming country," says Mr. Jennings. "50 acres in crop this year could not look better"—"A good class of people have settled here"—"There are good schools and churches"—"I could not ask for better neighbors, and in my opinion *there is no better place in the world than this to build a home.*"

Another settler, Mr. H. P. Heath, who came here from Cass County, Iowa, in 1905 writes that his oats this year yielded 70 bushels and wheat 35 bushels an acre. He says, "I have made good since coming here and have no desire to leave; my faith in the future of this country is stronger than ever."

We have many such enthusiastic letters from men who feel that they have found here a region where conditions permit the man with small means to acquire a highly productive farm which will not only yield a good living but insure his future. They are all published in our North and South Dakota book which can be secured free upon request to the undersigned.

Start Tractor Farming

Bigger Crops—Less Expense—Easier Work

A TRACTOR gives you the power you need to practice best farming methods plow deep and do all your work in the right way at just the right time, which means bigger crops. Gives you power that doesn't need to stop for rest—power that hot weather and hard ground can't stop—power in a concentrated form that one man can handle. You can't turn a switch and stop a horse eating. But a tractor stops eating when it stops work, and when it is working it costs you less than to feed enough horses to do the same work.

There's a Size Avery Tractor to Fit Your Size Farm

Avery Tractors are built in sizes to fit any size farm. They have sliding frames, double drives, two-speed gears, low speed heavy duty tractor motors, extra large crankshafts, renewable inner cylinder walls, no pumps or fan.

Prices: They are sold at low prices as follows: 3-Plow Tractor, $760 cash; 4-Plow Tractor, $1120 cash; 5-Plow, $1680; 6-Plow, $2145; 8-10-Plow, $2475. Avery "Self-Lift" Plows and "Yellow-Fellow" Threshers are also built in sizes to fit any of above size tractors. We also build a special smaller size tractor for $295 cash. All built and backed by an established company owning a large factory and many branch houses which insure permanent and prompt repair and expert service.

GUARANTEED Seed Corn

THE ADAMS SEED CO. **BOX 50, DECORAH, IOWA**

The fall berry is a great acquisition and it will be widely planted. The price of plants has been very high, but it will soon decline, for it multiplies like the Warfield or Dunlap. But even $5 per hundred is not more than they are worth to get a start.

SLOW IN ADOPTING ADVANCED ORCHARD METHODS.

To the Editor:—The man who causes two blades of grass to grow where only one grew before has been called a public benefactor. We do not dare to apply that to the growing of apples, for we are raising too many now—such as they are, but if every farmer would succeed in growing a sound apple where he is growing a wormy or scabby one now a big question would be solved. Remember I am speaking from the standpoint of the farm orchardist. The specialist or commercial grower has learned this lesson long ago and the ones who have not learned it have dropped out or are trailing along at the rear of the procession.

The average farmer is sometimes a little slow in adopting advanced methods. He wants to "be shown." We remember the slow progress of the silo in its early day. Our own silo was one of the first hundred in the state and farmers came for miles to inspect silo, contents and stock and their comments were very amusing. One was sure the cows would not survive the winter; another would wait and see how long their teeth would withstand the action of the acid in the silage.

What was the principal factor in the later growth of the silo? While the farm institute and agricultural press must be given much credit, the successful silo, the first in its neighborhood, did more than anything else. When a farmer sees that his neighbor is beating him along any particular line he wants to know the reason, and if that reason is the silo he is going to have one of his own.

We believe that one successful farm orchard in a community will do more to correct the present abuse along this line than anything else. How are we to get it? Here is one plan: The farmer with several boys may have one that is horticulturally inclined. Turn over the orchard to him; make him responsible for everything; buy him a year's membership in the state horticultural society for 50 cents; put him in the way of getting all of the free bulletins and circulars given out by the society; encourage him to exhibit at the fairs—there is no educator like the show ring, where there is a competent judge. We believe he will make a bigger return on the investment than in any other line on the farm, and we venture the opinion that it won't be long before he will be imitated by many boys in the neighborhood. If we can get the boys started right in this it will be of more vital importance than converting older ones.

The present season has been a very discouraging one for the farm orchardist, and for several reasons. The same combination of events may not happen again for a long time. The crop of early apples was one of the largest ever raised, with the keeping quality much below normal, many varieties being almost as perishable as small fruits. Added to this was the immense peach crop shipped into apple territory and sold in some instances at less than apple prices.

The habit of farm orchards in bearing only one crop in two years is another thing that can be remedied to a certain extent. In my own orchard we always have annual crops; not always the same, for the climatic conditions vary each year to a certain extent, but the condition of the tree controls to a great extent. The tree in the farm orchard that is left to shift for itself soon produces too large a bearing surface, and after bearing an abnormal crop, if it has not been properly nourished, is in no condition for a crop the next year. Judicious pruning and fertilizing will correct these conditions.

The marketing of the crop is the one big unsolved question that confronts us all, and we hope to see in the near future a state-wide organization to handle this department. We believe the members of the state horticultural society are coming to the next annual meeting with the determination to "start something." Let us all be "boosters." H. C. Melcher.

My Low Prices And High Quality Cause Big Sensation

Below are samples. Read them over. Compare them and remember everything I sell is first-class and I guarantee it. More customers is what I want. My prices get them, my quality holds them. Listen! Small profit, small selling expense for cash, no bad accounts for you to help pay for, no commissions to agents, very little advertising expense and because I am an actual grower, not a jobber, and sell direct from nursery to you is why I can make such low prices and save you 30 to 50 per cent. Read on.

THE LADY OF TEARS.

Through valley and hamlet and city,
Wherever humanity dwells,
With a heart full of infinite pity,
A breast that with sympathy swells,
She walks in her beauty immortal.
Each household grows sad as she nears,
But she crosses at length every portal,
The mystical Lady of Tears.

If never this vision of sorrow
Has shadowed your life in the past,
You will meet her, I know, some to-morrow,
She visits all hearthstones at last.
To hovel, and cottage, and palace,
To servant and king she appears,
And offers the gall of her chalice—
The unwelcome Lady of Tears.

To the eyes that have smiled but in gladness,
To the souls that have basked in the sun,
She seems in her garments of sadness,
A creature to dread and to shun.
And lips that have drunk but of pleasure,
Grow pallid and tremble with fears,
As she portions the gall from her measure,
The merciless Lady of Tears.

But in midnight, lone hearts that are quaking,
With the agonized numbness of grief,
Are saved from the torture of breaking,
By her bitter-sweet draft for relief.
Oh, then do all graces enfold her;
Like a goddess she looks and appears,
And the eyes overflow that behold her,
The beautiful Lady of Tears.

—Ella Wheeler Wilcox.

TRAINING CHILDREN IN GENTLE MANNERS.

It is the general opinion that young people are inconsiderate guests. They close doors noisily, leave lights burning, their rooms in disorder, and in various ways annoy their hostess and other members of the household. But the child can scarcely be blamed altogether for this state of affairs. Children learn largely through imitation and if those who are responsible for their training are remiss in observing rules of hospitality and gentle manners, they cannot expect the children to be model of gentleness and consideration. Manners are hard to cultivate when one is grown, but they are easy to cultivate or change in a child, and what the child learns when young he does not easily forget.

One day a mother was commended on the beautiful manners of her little five-year-old daughter. A friend asked the mother at what age she commenced to train her daughter and this was the answer: "I think it was some time before the stork brought her to me. I know that I was very careful about her manners the very day the stork brought her to me."

Parents who wish their children to be distinguished for their gentle manners should begin by being good examples. They should not be noisy and rude before them and expect them to be quiet and well bred. As one noisy youngster said when he was censured for talking loudly, "Mother makes all the noise she wants to and I do not see why I should not be given the same right."

As a rule children have, naturally, soft voices and quiet manners, and it is only when they are surrounded by persons who are careless and noisy that they become loud and boisterous. A mother who is courteous to her friends and those near to her should insist that her children give the same thoughtful care to playmates and those in the home. "If you please" and "I thank you" are simple words, but they make life sweeter.

When you notice your child becoming careless and forgetful about these matters, do not let it pass by. Be sure to correct him, but do it in a gentle way and, above all, when you are alone with the child. A child is sensitive and resents being corrected in public and, besides, it will not take him long to learn that that very act is a breach of good manners on your part. Explain that the main difference between a gentle and an ill-bred man or woman is the difference in manners. Because of this the one is sought after and the other shunned.

CROCHET STITCHES.

Since we began giving directions for different crochet patterns in the Home Department we have had a large number of letters from readers who have never done any crochet work and who ask for instruction as to how to make the stitches. For the benefit of these we give herewith an explanation of the different crochet stitches:

Chain (ch)—Make a slip knot on needle, draw thread through this loop. Again draw thread through this second loop and continue until the chain is of length desired.

Slip Stitch (sl st)—Put hook through work at stitch indicated in directions; draw thread through work and loop on needle at same time.

Double (d)—Put hook through work, thread over hook and draw through, making two loops on needle; thread over again and draw through both loops.

Half Treble (h t)—Thread over needle, hook through work, thread over and draw through, giving three stitches on needle, thread over and draw through the three stitches at once.

Treble (t)—Thread over the needle, hook through work, thread over and draw through, giving three stitches on needle; thread over, draw through two, over again and draw through remaining two.

Double Treble (d t)—Thread over twice, hook through work, thread over and draw through, giving four stitches on needle, *thread over and draw through two; repeat from * twice.

Long Treble (l t)—Thread over three times, hook through work, thread over and draw through, giving five stitches on needle, thread over and work all off by twos.

Picot (p)—A picot is formed on a chain by joining the last four stitches (or any given number) in a ring by working a double in the fourth stitch, counting from hook. In making picots on doubles around the edge of a pattern, the picot is worked in the top of the last double.

HOW TO WASH WOOLEN GOODS, AND WHY.

To wash woolen goods successfully the water should be soft and warm, not hot, and of uniform temperature throughout the operation. Never put soap directly on the fabric and use only the milder kinds. Make a nice suds before putting the garment in the water. Scrub gently and wring through loosely-set wringers.

Once washed, the goods should be immediately hung up to dry and never allowed to lie about wet. It is best to dry woolens out of doors if the air is dry and the temperature above freezing.

The reason for this careful treatment is found in the peculiar nature of the wool fiber. Its outer layer is made up of minute serrations which are arranged in some such manner as the scales on a fish. These scales are softened and opened up by hot water and by such alkalies as are found in the harsher soaps. While in this softened condition the pressure due to hard scrubbing is sufficient to cause the serrated edges of the fibers to interlock or felt, and felted fibers

BIG BROTHER MAKES A FINE HORSE.

Would You Work For $3.50 An Hour?

A WOMAN said that it was foolish to waste time making soap at home when it could be bought so cheaply at any store. Another woman replied to her in the columns of the *Chicago Daily News* as follows:

"She and housekeepers like her keep prices high and times hard. Let me, from fifteen years' experience, relate the real facts in regard to soap making:

"For 50 cents' worth of lye (six cans) and ninety minutes' time each year, I make more than 100 cakes of clean, hard soap that compares favorably in color, odor and efficiency with soaps that cost 7 cents a cake or 80 cents a dozen on sale."

"Therefore, my Scotch economy has saved at least $7 a year at a cost of less than two hours' time and 50c for lye.

"Francis —— may value her time at more than $3.50 an hour, but the average homemaker shouldn't!"

Save your scraps of grease, use

Lewis' Lye

The Standard for More than Half a Century

and make your own soap at home. You'll be glad to save $3.50 an hour.

are usually hard and brittle. This is because the alkali which has helped in the felting process has removed from the cells certain fatty substances which serve to make the fiber soft and pliable.

Fabrics which have become hard and felted have not only lost their attractiveness, but also most of their usefulness as a protection from the cold. This latter quality is due to the "air blanket" which forms in the spaces between the fibers, for quiet air is, as is well known, a very poor conductor of heat and cold. Therefore, when the fibers have become interlocked or felted and the air spaces are lost, the fabric is no longer able to materially aid the body to retain its heat.

1916 IS BABY YEAR.

The facts about American babies, the needs of American babies and America's responsibility to her babies will this year be known as never before, because the first week in March will be Baby Week throughout the country.

More than 400 communities representing every state in the Union are already laying their plans for Baby Week, according to the Children's Bureau of the U. S. Department of Labor, in order that during those seven days the needs of the babies may be so presented that all the parents in those communities will learn a little better how to care for their babies and all the citizens will realize that they have a special obligation to safeguard the conditions surrounding babies. And it is confidently believed by those who are interested in this nation-wide Baby Week that the remainder of the year will be marked by a strengthening of all community activities for saving babies' lives and giving them a better chance to grow to a healthy maturity.

The Baby Week idea originated in Chicago not quite two years ago. Then New York had a Baby Week, and Pittsburgh and other cities. Such practical benefit has in each case resulted that the General Federation of Women's Clubs has undertaken to promote this nation-wide observance. State health officials and national organizations interested in public health and child welfare have taken up the plan and in various ways are giving it not only their sanction but their active co-operation. The extension divisions of the state universities have promised special assistance in interesting and helping Baby Weeks in rural communities.

The Federal Children's Bureau believes that Baby Week will give more parents a chance to learn the accepted principles of infant care and will awaken every American to his responsibility for the deaths of the 300,000 babies who, according to the census estimates, die every year before they are twelve months old. Therefore, the children's bureau has prepared a special bulletin of practical suggestions for Baby Week campaigns, adapted to the varying needs of communities of different types. Copies of this bulletin may be had free of charge from the Children's Bureau at Washington.

SANDWICHES FOR THE SCHOOL LUNCH.

Well-prepared sandwiches should form an important part of every school lunch. They are easily made and should be very wholesome and palatable. Variety is needed and there should be at least two kinds of sandwiches in each lunch.

The bread for sandwiches should be cut in thin slices of uniform thickness and the butter should be spread evenly over both slices in order to keep it moist and prevent any fruit filling that may be used from making the sandwiches soggy or indigestible. Sandwiches which must be made several hours before they are to be eaten should be wrapped in a moist cloth and kept in a cool place or wrapped in wax paper to prevent them from drying out or absorbing odors.

Miss Bab Bell, of the University of Missouri, gives the following directions for making a variety of sandwiches other than meat:

SANDWICH MATERIALS.

Bread and Butter.—Cut the bread in thin slices. Spread the butter evenly on both slices and press together.

Lettuce.—Make a bread and butter sandwich and place a leaf of crisp lettuce, washed and thoroughly dried, between the two slices. Put a teaspoonful of mayonnaise dressing on the lettuce leaf.

Nuts.—Make a lettuce sandwich, spread one side with nuts, chopped fine, and mixed with good dressing.

Chicken.—Chop cold, boiled chicken and moisten with mayonnaise dressing. Spread between bread. Add a lettuce leaf.

Eggs.—Chop the white of hard boiled eggs very fine. Mix the yolks with mayonnaise dressing and season with pepper and salt. Add the whites and spread between bread. Lettuce may be used also.

Dates.—Make a filling of one-half cup of stoned dates, one-half cup of sweet cream; spread between slices of buttered bread.

Pimento and Cheese.—Make a filling of one-half cup of cream cheese and one-fourth cup of chopped pimento, two tablespoons salad dressing, salt and pepper. Spread on butter evenly. Cottage cheese may be used or the pimento may be left out.

Peanut Butter.—Peanuts ground and mixed with a salad dressing make an excellent filling. The commercial peanut butter may also be used. Spread evenly between buttered bread. A crisp lettuce leaf adds to the attractiveness of this sandwich.

RECIPES.

Orange Marmalade.—Select thick-skinned oranges. Use six oranges and two lemons. Slice about an eighth of an inch thick and cover with water. Let stand twenty-four hours. Set on stove and boil twenty minutes; then let stand another twenty-four hours. Measure, and use an equal amount of sugar. Drain juice from fruit. Put sugar in juice, boil and skim; add fruit and cook slowly until clear and jellied.

Date Cake.—Pour one cupful of boiling water over one cupful of dates (stoned but not chopped). Add one level teaspoonful soda and let stand while you make the cake. For cake use one cupful of sugar, one tablespoonful of butter or lard, one and one-half cupfuls of flour. Add dates and beat well. Bake in moderate oven. Good for children's lunch.—Miss K. DeG.

Foamy Sauce for Plain Pudding.—Beat one tablespoonful of butter with one cupful of powdered sugar. Add two beaten yolks and little by little a small amount of grape juice and a little grated nutmeg. Set the bowl into the top of the teakettle of boiling water and heat for a minute or two. Serve at once.

Cream of Carrot Soup.—Wash the carrots and scrape them, cut in thin slices, until you have two cupfuls, using only the red part. Put in a stewpan with a tablespoonful of butter, one tablespoonful of sugar and salt to taste. Cover with water and cook until tender; then rub through a sieve. Thicken with a thickening made of one quart of milk, one and one-half tablespoonfuls flour and one tablespoonful of butter. Season with salt and a dash of paprika. Serve with a sprinkling of chopped parsley.

Cranberry Pudding.—Three-fourths cupful of sugar, one cupful of milk, one teaspoonful of butter, two and one-half cupfuls flour, two teaspoonfuls baking powder, one cupful cranberries, one egg. Cream the butter and sugar, add beaten egg, milk and flour sifted with baking powder. Then add the cranberries, which have been picked over, washed, dried and rolled in flour. Pour into a buttered mold and steam for two hours.

Sauce for Cranberry Pudding.—One-half cupful of sugar, two cupfuls of boiling water, three tablespoonfuls flour, one tablespoonful of butter, one teaspoonful of vanilla, one-half teaspooonful of lemon flavoring, a pinch of salt. Mix sugar and flour, add water gradually, stirring constantly. Let it boil a few minutes, then add butter, salt, lemon and vanilla.

A New Salad.—Wash sweet peppers, either green or red; remove seeds and the white strings from the inside. Set the pepper on ice or in cold place for an hour, then fill with grape fruit pulp, chopped nuts and minced celery that has been mixed with mayonnaise. Serve very cold.

HELPS FOR THE HOUSEWIFE.

Yolks of eggs should be beaten until a spoonful can be taken up clear from strings.

The mica in stoves can be made clear by washing with vinegar slightly diluted. If the black does not come off immediately, allow the mica to remain in the vinegar a short time.

Vegetables, to be tender, should be cooked slowly.

In making French dressing use twice as much oil as vinegar.

An old piano stool will be found useful in the kitchen, as it can be adjusted to different heights.

Dingy overshoes can be made to

shine if wiped off with a cloth wrung out of ammonia water.

To thoroughly clean an aluminum pan in which vegetables have been cooked, boil a half lemon in it for a few minutes, or a tomato, and the inside will become bright again after a good scrub with soap.

Buy a 10-cent pair of rubber heels and when you want to wear a low-heeled shoe with high-heeled rubbers, put them in the heels of the rubbers. This saves the rubbers and adds to the comfort in walking.

Make pan holders square and of very heavy cloth. Leave one of the four sides open so that the hand can be slipped in as into a pocket. This protects the back of the hand as well as the palm. This will be found useful when baking and very convenient also as a protection against the steam of kettles and the like.

WEIGHTS AND MEASURES.

One-half kitchen cupful equals one gill.

One kitchen cupful equals one-half pint or two gills.

Four kitchen cupfuls equal one quart.

Two cupfuls of granulated sugar equal one pound.

Two and one-half cupfuls of powdered sugar equal one pound.

One heaping tablespoonful of butter equals one ounce.

One heaping tablespoonful of sugar equals two ounces or one-quarter cupful.

One cupful of butter equals one-half pound.

Four cupfuls of flour (one heaping quart) equals one pound.

Eight round tablespoonfuls of dry material equal one cupful.

Sixteen tablespoonfuls of liquid equal one cupful.

THE YOUNG FOLKS

All letters from boys and girls to this department should be sent to office of The Wisconsin Farmer, Madison, Wisconsin.

HANSEL AND GRETEL.

The story of Hansel and Gretel is familiar to some of our Young Folks, but others haven't heard it yet and some who do know it like to hear it over again, and so we are going to tell it once more.

Once upon a time there lived a little boy and a little girl whose names were Hansel and Gretel. Their mother had died and their father had married again. The woman he married was not kind to the children and one day when the bread was almost gone, for they were very poor, she said to her husband:

"There is bread enough for two, but not enough for four. When we go out into the woods today to gather fagots to sell, I will give each of the children a crust of bread. Then, when they are tired, we will get them to lie down by the fire to sleep. We will gather our fagots and leave the children in the forest."

Now, the father loved his children and did not want to treat them that way. But his wife insisted and insisted and finally he agreed to her plan. Hansel was not asleep as they thought he was and heard every word that the stepmother had said. So when he knew that his father and she were asleep, he got up quietly, opened the door and slipped out. Around the house were many smooth, white pebbles, with which he filled his pockets.

Next morning, bright and early, the stepmother called them harshly to hurry and dress quickly. They were going to the woods to gather fagots. She gave them each a crust of bread and Gretel put both of these in her pocket, for Hansel's pockets were full of stones. They all started away together.

Hansel kept looking back so often that the stepmother said to him:

"What are you looking back for?"

"My little white pigeon is waving good-by to me from the housetop," he replied.

"Nonsense," she said. "That is only the sun shining!"

Just the same, Hansel managed to drop one of the white pebbles now and then. Finally they reached a clear spot in the forest.

"Now gather wood and we will build a fire, and you can rest," said the stepmother.

They built a fire and gathered around to eat their crusts. The father and stepmother went out to gather fagots. Soon the children fell asleep and when they awakened it was dark—very dark, and no father or stepmother was near to take them home.

Little Gretel began to cry, but Hansel said:

"Never mind, sister, just wait until the moon comes up and we will be able to find our way home." Sure enough, when the moon came up they were able to see every little white stone that Hansel had dropped. They followed the path of stones until finally they reached their home safely. There they opened the door, slipped in quietly and went to bed. The next morning when the father and stepmother wakened, there were the children in their beds. As they had their fagots to sell they would have enough money to live on for a little while longer.

The children were happy for a few days. Then one day the money was all gone again and so the stepmother said:

"Now, tomorrow we will take the children farther into the woods and this time they won't be able to come back."

Hansel heard what she said again and tried to get out to pick up more white pebbles. But this time the stepmother had locked the door and put the key in her pocket. When he told Gretel she cried and Hansel comforted her:

"Never mind, sister. She said she would give us a crust of bread. I will break mine into tiny crumbs and scatter them along the way. Then we can follow those for a path home."

So they went with their father and stepmother and went farther into the woods this time. Almost with each step, Hansel would crumble his bread and drop the white crumbs, but the birds in the woods were so hungry that they ate the crumbs as fast as they were dropped. At length the woman made a fire and left the children to sit by it. Gretel gave her brother half of her bread and soon the children were fast asleep. When they awakened it was dark as before and Gretel was frightened.

"Never mind, sister," said Hansel, "wait until the moon comes up."

But when the moon came up, they could not find the crumbs, for the birds had eaten every one. The children wandered this way and that through the woods all night. In the morning they saw a clear spot where stood a little house built of sugar, candies and cookies.

"Ah," said Hansel, "now we will have a feast."

They went over to the little house and Hansel began picking cakes off the roof for himself, while little Gretel broke off an icicle of candy and began eating it. While they were having a feast a little old woman came to the door and said:

"Ah, children. How are you? Come inside, I have lots of good things here."

So they went inside and ate some of the good things she had and were put to bed in little soft beds. They were so tired that they went to sleep right away. When they got up the old woman was not as kind. She took Hansel by the collar, dragged him outside and locked him up in a little shed. Then she said to Gretel:

"Get wood and build me a fire. I am going to fatten your brother and then some day soon I am going to eat him. After that I will fatten and eat you, too."

Poor little Gretel was so frightened that she trembled so she could hardly carry the wood. Gradually she grew a little less afraid of the old woman.

Every day the old woman would go to the door of the shed and say to Hansel:

"Stick your finger out and let me see if you have any more meat on you."

The old woman could not see very well, so instead of sticking out his finger Hansel stuck out a bone that he had found in the yard. The old woman would feel the bone and when she could not feel much meat she would say:

"It is pretty hard. I will let you wait a day or two."

Each day she would give him the best to eat and hoped she could fatten him. At last she said to Gretel:

"Build me a good fire and get my oven hot. I am going to roast Hansel today, whether he is lean or fat."

When she got the oven all hot she said:

"Step in the oven here, Gretel, and see if it is hot."

"Ah," said Gretel, "I don't know how."

"Oh, yes, you do."

"No, show me," said Gretel.

As the old woman jumped in to show her how, Gretel slammed the oven door and left the old woman in there to roast. Then she got the keys and ran out quickly and called to Hansel:

"Oh, brother, the old woman is roasting. Come out."

Hansel Gretel went into the house to see what they could find to take with them, for they knew that it would take a long time to find their way home. There in the witch's hut they found a box full of jewels and money in another box, cakes and rich food. Gretel filled a big lunch box for them and Hansel strapped a box of jewels on his back. For days they wandered about the woods and at last found their father's door.

Their stepmother, in the meantime, had died and their father was lonely for his children. Hansel and Gretel told their story and showed him their jewels and money. There was enough so that they were no longer poor and left the little old hut in the forest for a nice big home, and had everything they wanted.

International Sunday School Lesson

Lesson for January 9, 1916
(By E. O. SELLERS, Acting Director of Sunday School Course.)

THE COMING OF THE HOLY SPIRIT.

LESSON TEXT—Acts 2:1-13.

GOLDEN TEXT—Know ye not that ye are a temple of God, and that the spirit of God dwelleth in you?—I Cor. 3:16 R. V.

Good teaching demands the use of the concrete; objective teaching is fundamental and essential. The incarnation is God's objective teaching, "God manifest," (a) to reveal Himself, John 14:9; (b) to take away sin, I John 3:5; (c) to destroy the works of the devil, I John 3:8. So likewise Pentecost is a great objective lesson. This chapter has been divided as follows: (1) The Coming of Power (vv. 1-13), (2) The Empowered Witness (vv. 14-36), (3) A Powerful Result (vv. 37-47).

I. Power, 1-4. At the end of our last lesson the disciples were in prayer. The Lord's promise (1:5) was conditioned upon obedience. At last "the day" arrived (Lev. 23:15-21). Their hearts were fused and the fundamental requirement for service, the baptism of the spirit, came upon them. There has been no need since then to tarry any time at all to receive a like blessing. Lack of unity has much to do with our not receiving the spirit now and the consequent lack of power. Suddenly from out of heaven came a mighty sound (v. 2) and it is such a wind that the church needs today. There were three manifestations at this time and one other subsequently (See 2:44, 4:34, 35; 5:4). (1) **Wind.** Let us keep clear the difference between symbol and spirit. The manifestation was "as wind." Wind is mysterious, universal and mighty, but like Elijah on the mountain God is not alone as a mighty tempest. The sound filled the whole house. Wind is figurative of judgment (Jer. 22:22, Hos. 13:15) of the Spirit (John 3:8), also of heresy (Eph. 4:18). This last suggests the vagaries and imitations suggested or abetted by Satan to keep us from the truth. (2) **Fire.** This symbolizes power, light, heat and purifying, but the fire was not the spirit nor do we recall another such manifestation since (3) **Tongues.** The fire took the form of tongues which parted or portioned themselves out to "each one of them" though Peter is alone subsequently more prominent.

Every manifestation of the spirit is

always that of some new power for Christ (I Cor. 14:2-19).

11. Perplexity, vv. 5-13. The question may arise, had the spirit been seen before? And the answer is "yes" (Matt. 3:16, Jno. 1:32). What then was new? The answer to this is the program of power. The first evidence of power was the gathering of the people (v. 6). The disciples at once testified to each of the sixteen classes mentioned (9-11) of the "mighty works of God." Not of the gift, but the giver, a different sort of testimony than that given by many who today profess to have the gift of tongues. The second result was an amazed people, "perplexed," for them as now the world cannot understand the spirit-filled man. These spirit-filled men forgot self and were lost in their testimony (v. 11).

It is of interest to note that they did not even say much if anything about the spirit himself. Their testimony, for which many later gave their lives, was regarding God's mighty work of the resurrection of Jesus from the dead (vv. 24, 32).

The spirit-filled man is sure to emphasize this mighty work and the evidence of the spirit in a man's life is his loyalty to a crucified, risen and ascended Lord.

A third result was that people misunderstood and charged drunkenness, a fact seized upon later by Paul to teach us the truth (Eph. 5:18). The only sure cure for intemperance, or any other evil, is an infilling of the holy spirit. The final and complete fulfillment of the prophecy (vv. 14-21, Joel 2:28, 29) of which Pentecost was a partial fulfillment will be in the "day of the Lord." But then, as now, all who call upon him shall be saved (v. 13, Rom. 10:13). "Some mocked," even as today ridicule or parody are the enemy's choicest weapons. Pentecost is an event well attested, that marked the ushering in of a new dispensation, that was misunderstood, but one that can be verified by experience.

Pentecost was a revelation, a manifestation of a new spiritual kingdom, distinctly Christian, that exposes sin and exalts the son.

Pentecost is a prophecy of real Christian unity, of a spiritual administration, of Christ's intercesson and an evidence of an abiding presence.

When we are spirit-filled the Lord Jesus Christ will occupy the whole horizon of our experience, our testimony and will control our service. The spirit-filled servant can exclaim "The Lord (Jesus) is my shepherd," He is Lord, He is my shepherd; He is, not has been or will be, but He is my shepherd.

The gift of the spirit must not be confused with the spirit's "gifts" (I Cor. 12) whereby we are enabled to do the work He directs in order to glorify the Son—not the church, nor man, nor a religious experience, but the Lord Jesus (Gal. 2:20, II Tim. 1:7).

Regular price per year	$2.35	You Save $1.15

If none of the above combinations suit you, you can make up your own club of papers in the following way: First select The Wisconsin Farmer and figure it at $1.00 per year. Then select any of the papers or magazines listed above and figure them at half their regular subscription price as indicated above, choosing whatever papers or magazines that appeal to you. As an example, suppose you should want The Wisconsin Farmer, Kansas City Weekly Star, Woman's World and People's Home Journal. You would figure The Wisconsin Farmer in the combination at $1.00; then you would add up the regular subscription price of the other three papers, which amounts to $1.10. Half of that amount equals 55 cents. Add this to the regular price of The Wisconsin Farmer, which is $1.00, and you would have a total of $1.55, which would be the rate for The Wisconsin Farmer, Kansas City Weekly Star, Woman's World and People's Home Journal.

If you wish to subscribe for any papers or magazines not listed in any of the above offers, write to us for special rates. Send all orders to Club Dept., The Wisconsin Farmer, Madison, Wis.

OUR FASHION DEPARTMENT.

ALL PATTERNS, 10 Cents Each.

THIS department is prepared especially for The Wisconsin Farmer. We can supply our readers with high-grade, perfect-fitting, seam-allowing patterns at 10 cents each, postage prepaid. Full directions for making, as well as the amount of material required, accompany each pattern. When ordering, all you have to do is to write your name and address plainly, tell us the correct number and size of each pattern you want and inclose 10 cents for each number. We agree to fill all orders promptly and guarantee safe delivery. Address all orders to The Wisconsin Farmer, Madison, Wis.

7520 Ladies' Shirt Waist.—Cut in sizes 34 to 42 inches bust measure. The front of this waist has an original cut inasmuch as the central portion extends up to the top of the collar, without any seam and the sides of the front are gathered and attached to the edges of the shoulder extensions of the raglan sleeve.

7118 Ladies' Skirt. Cut in sizes 22 to 32 inches waist measure. In this handsome walking skirt the front gore forms a panel, extending from the belt to the hem. At sides and back there is a deep yoke and below this the skirt is plain, with reversed plait at the sides and in the center of the back.

7001 Ladies' Shirt Waist.—Cut in sizes 34 to 44 inches bust measure. Very simple, the back extending forward over the shoulders to form a small yoke, the upper edges of the front gathered. The closing is in front and leaves the neck open and trimmed with a handsome collar.

7526 Girls' Coat.—Cut in sizes 4, 6, 8, 10 and 12 years. Nice and snug in fit at the shoulders and over the chest and back this coat is so shaped that the material flares widely at the lower part and is folded in as plaits below the belt. The neck has a flat collar and the long, plain sleeves are finished with a plain cuff.

7503 Children's Middy Dress.—Cut in sizes 2, 4, 6, 8 and 10 years. This middy blouse opens only a short distance at the neck and a little at each side seam at the hem. There is a wide collar and the sleeve has a band cuff and tucks above the wrist. There is a sleeveless underwaist closing in the back and to this the plaited skirt is attached.

7499 Ladies' Dress.—Cut in sizes 34 to 42 inches bust measure. Smart but simple this dress has a plain blouse, with side front closing and either high neck with straight collar or low neck with wide collar, or using both. The four-gore skirt has either raised or regulation waistline.

6893 Boys' Overcoat.—Cut in sizes 6, 8, 10 and 12 years. Cheviot, serge or chinchilla can be used to make this overcoat. The sleeves extend to the neck edge. Either the plain or patch pockets may be used. The cuffs and belt may be omitted, if desired.

7523 Ladies' Dress.—Cut in sizes 34 to 42 inches bust measure. This novel design shows a waist which is cut with body and sleeves in one piece and with surplice effect in both front and back. The space is filled in with plain material. The skirt has three gores, with front closing.

7240 Girls' Dress.—Cut in sizes 6, 8, 10 and 12 years. The two-gore skirt of this frock is joined to an underwaist and over both is worn the jacket tunic which closes in front, spreading a little after passing the bust. At the open neck is a small, flat collar and the sleeves may be long or short.

7120 Ladies' Dress.—Cut in sizes 34 to 44 inches bust measure. This model has the blouse closed in front, with a small vest panel below the yoke line. A turnover collar finishes the high neck and the sleeves are either full length or short. The skirt is cut in one piece.

Price of any of these patterns 10 cents each.

Home courses at the colleges of agriculture in the grain-belt states are developing into such importance that farm women cannot afford to overlook them. These practical courses provide a great amount of information which will be a great benefit to any farm women

Winning the Wilderness

By Margaret Hill McCarter

Author of "The Price of the Prairie," "A Wall of Men," "The Peace of the Solomon Valley," etc.

(Copyright, 1914, A. C. McClurg & Co.)

CHAPTER XXII—Continued.

Twelve hundred men rose no more from that bloody field before Yang-Tsun. The fighting force, sixteen thousand strong, was wearing off at the rate of almost a regiment and a half a day, and it was yet a hundred miles to Peking.

All about Thaine were men with faces grimy as his own; their lips, like his, split and purple from the alkali dust. They had had no water to drink in all that long day's twelve miles of marching and six hours of fighting. Fearful is the price paid out when the wilderness goes forth to war! And heroic, sublimely heroic, may be the Christianity of the battlefield.

"We must help these fellows," Thaine said to his comrades as the wail for water went up from wounded men.

"The river is this way," McLearn declared. "Hurry! the boys are dying."

So over countless forms they hurried to the river's brink for water. Thaine and Tasker and Boehringer were accustomed to muddy streams, for the prairie waters are never clear. But Goodrich from Boston had a memory of mountain brooks. The Pennsylvania man, McLearn, the cold springs of the Alleghanies, and for Binford there was old Broad Ripple out beyond Indianapolis. All these men came down with dry canteens to the Peiho by Yang-Tsun. The river was choked with dead Chinamen and dead dogs and horses. They must push aside the bodies to find room to dip in their canteens.

"You have one more lesson. You must learn to be a Christian."

Somehow the words seemed to ring round and round just out of Thaine's mental sight.

"Vasser! Vasser!" cried a big German soldier before him.

Thaine stooped to give him a drink, and as he lifted up the man's head he saw the stained face of Hans Wyker.

"It's very goot," Hans murmured, licking his lips for more. "Wisky not so goot as vasser," and then he trailed off into a delirium. "Don't tell. Don't tell," he pleaded. "I nefer mean to get Schmitt. I not know he would be der yet. I hide for Yacob, an' I get Schmitt in der back and I only want Yacob. He send me to der pen for sure yet next time. I hate Yon Yacob."

A little silence, then Hans murmured:

"I didn't go to Kansas City. I coom back to Gretchen's home by Little Wolf. I hide where I watch for Yacob. I shoot twice to be sure of Yacob, an' Schmitt, hidin' in der crack by der roat, get one shot. So I coom to Yermany and enlist. Gretchen, she coom too an' she stay der. Vell! I help fight Boxer some. Mine Gott, forgif me. I do once some goot for der world dis day.

And that was the last of Wyker.

The twilight hour was near. The wounded had been borne away by busy Red Cross angels of mercy. Wide away across the Chinese plain the big red sun slipped down the amber summer sky into a bath of molten flame. Then out of sight behind the edge of the world it turned all the west into one magnificent surge of scarlet glory, touching to beauty the tiny gray cloud flecks far away to the eastward; while long rivers of golden light by rivers of roseate glow mingled at last along the zenith in one vast sweep of mother-of-pearl. A cool breeze came singing in from the sea—fanning the fevered faces of the weary soldiers. The desolate places were hidden by the deepening shadows, and the serenity of the twilight hour fell on the battlefield.

Then the men of each nationality went out to bury their dead. Swiftly the little brown Japanese digged and filled up the graves into which their comrades were deftly heaped. The Russian and Siberian Cossack lunged their fallen ones in heavily and unfeelingly. The Bengalese and Sikhs thrust their own out of sight as they were planting for an uncertain harvest. Each soldier from France who lost his life on that battlefield fell on his own grave and there his countrymen covered him over, an unmarked spot in a foreign land.

Thaine straightened a minute above his spade. The cool breezes were grateful to his heated brow. The after-sunset glow seemed like a benediction of the Infinite on the closing act of the day. He saw the hurried and unfeeling dumping of bodies into the holes awaiting them. Then his heart grew big and something unspeakable as he noted how in all that irreverent and unsympathetic action the American and English soldiery alone were serving as brother for brother. In the long trenches prepared for them their dead were laid with reverent dignity and gentleness. Each one's place was carefully marked with a numbered slab that in a future day the sacred dust might be carried back to the soil of the homeland. As the sunset deepened to richer coloring and the battlefield grew still and still, far along the lines the bands of the English Royal Artillery and the Welsh Fusiliers, with the bagpipes of the Scottish Highlanders, mingled their music with the music of the splendid band of the Fourteenth American Infantry in the sweet and sacred strains of the beloved old hymn:

Nearer, my God to Thee,
Nearer to Thee.
E'en though it be a cross
That raiseth me.
Still all my song shall be
Nearer, my God to Thee,
Nearer to Thee.

And Thaine Aydelot knew that his last and biggest lesson was learned.

CHAPTER XXIII.

The End of the Wilderness.

Have I named one single river? Have I claimed one single acre?
Have I kept one single nugget (barring samples)? No, not I.
Because my price was paid me ten times over by my Maker.
Buy you wouldn't understand it. You go up and occupy.—The Explorer.

THE victory at Yang-Tsun had come with a tremendous loss of life. To go on now promised the cutting to pieces of the entire army. To stay here and await reinforcements would mean the slaughter of all the foreigners in Peking. In a council of war the next day English and Indian, Russian, German, Japanese, Italian and French, general after general declared for the wisdom of waiting at Yang-Tsun for reinforcements.

Up spoke then General Chaffee, of the American command:

"I will not wait while the Boxers massacre the helpless Christians. Stay here or go back to your own countries, as you please. My army will go on to Peking, if it must go alone."

And his will prevailed.

Followed then a memorable march, with the Stars and Stripes ever leading the line. The strength of the force was thirteen thousand now and one thousand of these fell by the way before the end of the journey.

After Yang-Tsun, for the only time in this ten days' campaign, the soldiers undressed and bathed themselves like Christians in the unchristian Peiho, and on the next day, which was the Sabbath, they listened to the military service. Six days they forged onward with the same cruel heat, and scalding air, and alkali dust, and poison water, over dreary plains, through deserted villages, twenty, twenty-five, and even thirty miles a day, they pushed on toward the Chinese capital.

And ever before them the Boxers slowly receded, stinging grievously as they moved. Sure were they that at last only dire calamity could await that slender column moving across the plains, led under a flag of red, white and blue, with bands ever playing The Star-Spangled Banner, while from line on line rolled out that wierd battle cry of "Rock Chalk! Jay Hawk! K U!" Sure were they that this stubborn little band of soldiers foolishly following the receding Boxer must at last crush itself like dead-ripe fruit against the ancient and invincible walls of Peking.

On the evening of the sixth day from Yang-Tsun the twelve thousand men of the Allied Armies, flower of the world's soldiery, stumbled into camp with their outposts in sight of the great walls of the City of Peking. This had been the longest and hottest of all the days, with the weariest length of march. A great storm cloud was rising in the west and the air hung hot and still before it.

Thaine Aydelot and his comrades threw themselves down, too exhausted to care for what might happen next.

"This is the hottest day I ever knew," declared McLearn wearily, as he lay prone on the ground looking up at the hot sky with unblinking eyes.

"I reckon you never hit the National pike on an August day, out between Green Castle and Terre Haute down in Indianny," Binford suggested.

"Nor St. Marys-by-the-Kaw," Boehringer, a Kansas man, added. "There's where you get real summery weather."

"Oh, kill him, Aydelot, he's worse than a Boxer. Don't you know I'm from Boston originally, which is only a State of Mind?" Goodrich urged.

"No matter what state you are from originally, you are in China now, which is in a state of insurrection that we must get ready for a state of resurrection tomorrow. What are you thinking about, T. Aydelot? You look like Moses and the prophets." McLearn half turned over with the question.

Thaine, who was lying on his side, supporting his head on his hand, quoted softly:

"'Oh, the prairies' air so quiet, an' there's allers lots of room
In the golden fields of Kansas, when the Sun
Flowers
Bloom.'"

A low boom of thunder rolled across the western sky; a twilight darkness fell on the earth, and a long night of storm and stress began for the army of deliverance encamped before Peking.

Outside the city the Boxers massed in numbers. Inside more than a hundred thousand waited the coming of hardly more than one-tenth of their number. No wonder they felt secure behind their centuries-old ways.

Thaine Aydelot was accustomed to sleeping tentless on the ground and

WON HIGHEST AWARD PANAMA-PACIFIC INTERNATIONAL EXPOSITION SAN FRANCISCO 1915

Eight Feet Wide, or Better

International Harvester Spreaders
Low Corn King
Low Cloverleaf

ONCE you have seen both kinds of work you will say: "There is certainly a wide gulf between the ordinary spreader and the modern I H C machine, with its good, wide-spreading device. Give me the up-to-date, time and labor-saving spreader."

International Harvester spreaders—Low Corn King and Low Cloverleaf—are made with wide spreaders that throw the manure out in a wide, even spread, and broken up into fine particles by the disks that give it a second beating. In this condition the soil takes up quickly and evenly the fertilizing elements.

Though they are narrow, conveniently handled spreaders, easy to drive right into stables for loading, they spread to a width of 8 feet, or better. This cuts the spreading time in half, increases the tractive power of the spreader by keeping the wheels off the slippery manure, and gives you the best machine made for top dressing. **I H C spreaders** are simply built, and very strong. They are low for easy loading. They are built in sizes to suit any buyer, and they do work that is uniformly satisfactory.

Be sure to see the **I H C** dealer who can sell you a **Low Corn King** or **Low Cloverleaf**—or write us for catalogue.

KATHLEEN NORRIS
Author of "The Heart of Rachael"

Would You Leave Your Husband IF—

If you were young, beautiful and refined—

If you discovered that your millionaire husband was a dissolute drunkard—

Would you put up with his degrading insults, as the price of a luxurious home, jewels, motor cars and gorgeous clothes—

Or would you leave him, to risk the future with the man you had learned to love **in spite of yourself?**

This is the distracting problem Rachael Breckenridge has to face in the greatest novel ever written dealing with a woman's inner heart-struggles—

"The Heart of Rachael"

By KATHLEEN NORRIS
Author of "The Story of Julia Page"

By far the most absorbing book Kathleen Norris has ever produced. More vital, more dramatic, more intense even than "The Story of Julia Page," the Pictorial Review sensation of last spring.

"The Heart of Rachael" lays bare before us the most vivid and compelling story of a woman's soul ever recorded!

The characters live and breathe! One tremendous climax follows another! Read the first chapter of this story and you simply cannot lay it down.

Begin "The Heart of Rachael" in the February issue of Pictorial Review. It will be finished quickly in four generous instalments concluding with the number on sale April 10th.

to being beaten by rains. He was a sound sleeper and he was very weary. But tonight he could not sleep. The morrow would see world movements that should change all future history; in which movements he was a tiny unit, as every furrow that his father, Asher Aydelot, had run across the face of the prairie had by so much won it from wilderness to fruitfulness.

All night long the rain poured in torrents upon the camp. A terrific cannonade of thunder shook the earth. The lightning tore through the clouds in jagged tongues of flame. Where Thaine lay he could see with every flash the great frowning black walls of Peking looming up only a few miles away. In the lull of the thunder a more dreadful cannonading could be heard, hour after hour. Thaine knew that inside the walls the Boxers were besieging the Compound. And inside that Compound, if he were yet alive, was his old teacher, Pryor Gaines. He wondered if the God of Battles that had led the armies all this long hard way would fail them now when one more blow might bring deliverance to His Children. He remembered again the blessing with which his father had sent him forth:

"As thy day so shall thy strength be. The Eternal God is thy refuge, and underneath are the everlasting arms."

The memory brought peace, and at length, wrapped round in the blessing of an absolute trust, he fell asleep.

Inside of the City of Peking on that dreadful night the madness of the Boxer forces was comparable to nothing human. Nor jungle beasts starving for food and drink, frenzied with the smell of blood and the sight of water, could have raged in more maniac fury than the fury possessing the demon minds of these fanatics in their supreme struggle to flood the streets of Peking with rivers of Christian blood. For such as these the Christ died on the Cross of Calvary. For such as these the missionary is offered up. A human jungle, untamed and waiting, to whose wilderness the soldier became a light-bearer, albeit he brought the gospel of gunpowder to aid him.

The great walls about Peking enclose an area some fourteen miles in length and twelve miles in width. Within these walls lie several cities, separated from each other by walls of lesser strength, intended, with one exception, in the opening of the twentieth century, not so much for defense as for boundary lines.

The exception is the Imperial City, inside whose sacred precincts it was firmly believed a foreigner might not set foot and not be stricken dead by the gods. This City within a city had defenses the allied armies were yet to come against. It lies on the north, inside the great wall. Just east of it, along the north wall, was the Foreign Legation, whose south and east bounds were lesser structures of brick and earth. Here all the foreigners and many native Christians had been shut in for six long weeks, with the infuriated Boxers hammering daily at their gates, mad for massacre.

Here they had barricaded themselves with all the meager means available. They had forfeited every gate with whatever might stop a bullet or check a cannon ball. They filled up the broken places in the walls with piles of earth; they dug deep trenches inside these walls, and inside these trenches they had built up heaps of earthworks. Daily they strengthened the weaker places and watched and prayed. No word from the big world outside seemingly could come to them —a little handful of the Lord's children, forgotten of Him, and locked dungeon deep from human aid. They had sent out a cry for help and had sent up prayers for deliverance. Frowning walls besieged by enemies lay all around them. They could only look up and lift up helpless hands in prayer to the hot, unpitying August skies above them. Sickness stalked in over the walls. Hunger tore its way through the gates. Death swooped down, and sorrow seeped up, and despair lay in wait. But hope, and trust, and faith, and love failed not.

They ate dogs and horses. They went half naked that they might make sand bags of their clothes for greater defense. They exhausted every means for protection and life, but they forgot not to pray.

On this August night, while unknown to the besieged the Allied Armies encamped only six miles away, the reign of terror reached its height for the little Christian stronghold.

The storm beat pitilessly on the starved and ragged captives. The rain softened the earthworks and the rivers of water in the trenches threatened to undermine the walls. Across these walls the incessant attack of cannon and roar of rifles was beyond anything the six weeks' siege had known, and only the power of Omnipotence could stay the bloody hands. So the long hours of the dreadful night dragged on.

At length came daydawn. The storm had rolled away. A lull in the besieging guns gave the Legation a little rest of mind. Hungry and helpless, it waited the passing of another day. A silence seemed to fill the city and the wiser ones wondered anxiously what it might portend.

Suddenly, in the midst of it, a great gun boomed out to the northeast. Another gun, and another. Then came a pause and the besieged listened eagerly, for their own walls felt no shock. Again came the bellow of cannon, nearer and heavier, repeated and repeated, and the roll of smoke and the rattling fusillade of bullet shots told that a battle was on. Outside the gates? An army come against Peking! The Army of Deliverance! They were here fighting for the Christians! Oh, the music of bird's song, of rippling waters, of gently pulsing zephyrs, the music of old cathedral chimes, of grandest orchestras—nothing of them all could sound so like to the music that the morning stars sang together as this deafening peal of cannon, this ripping rhythm of Krag rifles.

With bursting hearts they waited and watched the great wall to the north. It is sixty feet high and fully as wide at its base, tapering to twenty-five feet across the top. Could the gates be stormed? Could this wall be shaken? From the highest points inside the Compound eager eyes scanned the northeast as the battle raged on with crash of shells and whir of bullets. Then down to the waiting ones came a message that seemed to fly to every ear in the besieged city, making men and women drop to the ground in a very ecstasy of joy.

"They've run up the Stars and Stripes on the northeast wall!"

The sword of the Lord and of Gideon was come again to Peking, as it came once long ago to the Valley of Jezrell.

The Allied Armies broke camp on the morning of August fourteen in the year of nineteen hundred. Six miles away stood the most impassable defense an army of the West might ever storm. Yet the twelve thousand men did not hesitate. With General Chaffee's troops in the front of the line they fought through fiercely skirmishing forces up to the hoary old city's gates, the Fourteenth United States Infantry leading the way. The American guns cleared the Chinese soldiery from the top of the walls, and the American cannon were in line ready to blow open the huge gates.

"I want to know what's on the other side before I open up the gates," General Chaffee declared.

So the command was given for a volunteer to scale the wall, to stand up a target for the Chinese rifles! To be blown to pieces by Chinese cannon! Yet the armies must know what awaited them. There must be no debouching into a death-trap for a wholesale massacre.

Thaine Aydelot had cherished one hope since the twilight hour on the battlefield at Yang-Tsun—that when this day should come the Americans might lead the way through the Peking gates and be first to enter the strange old city. Not merely because he was an American patriot, but because to him the American soldiers with all their sins and follies of youth and military life were yet world missionaries.

Thaine knew his comrades shared his hope, whether for the same high purpose he could not have asked. He had no longer dreams of military glory for himself. His joy was in achievement, no matter by whose hand.

"There's an order for somebody to go up on the wall."

The word was passed along the line. Before it reached Thaine and his

comrades a young soldier had leaped forward to obey the order.

"Glory be, America first!" Goodrich said fervently.

"And a Kansan. A Jayhawker!"

Thaine did not know who said it. He saw the soldier, young Calvin Titus, a Kansas boy, leap after the Japanese coolies who ran forward toward the wall with the long bamboo scaling ladders. And for one instant's flash of time the old level prairies came swooping into view, the winding line of Grass River with the sand dunes beyond; the wheat fields, the windbreaks, the sunflowers beside the trail, and far away the three headlands veiled in the golden haze of an August morning. A Kansas boy the hero of the day—first of all that army to stand on top of that hoary old wall! The prairies had grown another name for the annals of history.

(To be continued.)

POULTRY

THIS department is edited by a competent poultryman, who will be pleased to answer questions concerning diseases, poultry management, etc., when they can be answered through the department. Questions will not, however, as a rule, be answered by mail, and stamps need not, therefore, be inclosed with inquiries. Address all letters relating to poultry topics to this office.

COMING WISCONSIN SHOWS.

Madison, Wis., January 3d to 6th, Jas. Tucker and W. E. Stanfield, judges; J. G. Halpin, secretary.

Sheboygan Poultry and Pet Stock Association, January 3d to 8th, G. L. Spratt, secretary; Geo. W. Hackett and F. Borchert, Jr., judges.

Waterford, Wis., January 3d to 8th, Geo. W. Hackett, judge; F. J. Albrecht, secretary.

Stanley, Wis., January 4th to 6th, W. H. Laabs, judge; Rev. D. W. Davis, secretary.

Marion, Wis., January 5th to 8th, F. S. Lindlow, secretary; J. E. Greenwald, judge.

DePere, Wis., January 5th to 9th, Geo. Wells, judge; Chas. Behrendt, Jr., secretary, Green Bay, Wis.

Manawa, Wis., Manawa Poultry Association, January 10th to 13th, W. H. Laabs, judge; A. C. Lindsay, secretary.

Eau Claire County Poultry Association, Augusta, Wis., January 10th to 13th, H. B. Seville, secretary; Geo. W. Hackett, judge.

Sparta, Wis., Progressive Poultry and Pet Stock Association, January 10th to 15th, E. H. Hoffman, Judge; J. L. Herbst, secretary.

Mineral Point, Wis., January 11th to 13th, G. M. Wells, judge; Mr. Tucker, secretary.

Stevens Point, Wis., January 11th to 15th, F. J. Blood, secretary; J. E. Greenwald, judge.

Augusta, Wis., January 10th to 14th, Geo. W. Hackett, judge; F. B. Seville, secretary.

Racine, Wis., January 10th to 15th, Geo. H. Northrup, judge; E. J. Amundson, secretary.

Antigo, Wis., January 13th and 16th, Geo. W. Hackett, judge; R. E. Krause, secretary.

Fond du Lac, Wis., January 13th to 16th, J. A. Tucker and Geo. M. Wells, judges; Wm. P. Kennedy, secretary.

Wausau, Wis., January 18th to 23d, Geo. W. Hackett, judge; L. H. Cook, secretary.

Green Bay, Wis., Northeastern Poultry and Pet Stock Association, January 19th to 23d, D. E. Hale, judge; L. H. Hebel, secretary. Comparison show.

Milwaukee, Wis., January 21st to 26th, Geo. W. Hackett, judge; Theo. Hewes, secretary.

Appleton, Wis., January 27th to 30th, Dr. W. L. Farrand, secretary; Greenwald and Laabs, judges.

Wild Rose, Wis., February 9th to 11th, Geo. M. Wells, judge; F. W. Crowe, secretary.

WISCONSIN POULTRY FACTS.

Estimated annual value Wisconsin poultry products $15,000,000.

Fifty million dozen eggs marketed annually by Wisconsin farmers who raise poultry.

One hundred and fifty thousand Wisconsin farmers raise poultry.

Three hundred young men and women are studying poultry husbandry at the Wisconsin College of Agriculture.

Sixty poultry shows are held in Wisconsin every year.

BADGER POULTRY PRIZES.

Poultry raised in Wisconsin come in for a large number of championships at the Great Mid-West Poultry and Pet Stock Association show recently held in Chicago. Many of the exhibitors whose fowls carried off first honors are members of the Wisconsin Poultry Association.

James G. Halpin, who as secretary of the Wisconsin organization is one of the managers of the forthcoming show, is arranging for the exhibition of as many as possible of these prize pens.

Wisconsin poultrymen who won at Chicago are:

White Plymouth Rocks, H. W. Halbach, Waterford; Partridge Plymouth Rocks, Ed J. Wagner, Arlington and J. W. Hunt & Son, Stoughton; Golden Wyandottes, F. L. Clausen, Oconomowoc, and Chas. Love, Waukesha; White Wyandottes, Charles Prei, Waukesha; Buff Wyandottes, J. R. Love, Waukesha; Partridge Wyandottes, W. W. Day, Janesville; Columbian Wyandottes, O. R. Eddy, Oconomowoc; Single Comb Rhode Island Red, A. J. Schloerb, Omro; Light Brahmas, Roy Beck, Galesville; Rouen Ducks, W. W. Day, Janesville.

Wm. Bell, of Arlington, won premiums on his Single Comb Brown Leghorns, Single Comb Buff Leghorns and Single Comb Black Leghorns.

SPECIAL CARE SHOULD BE GIVEN FOWLS IN COLD WEATHER.

To obtain good results from a flock of poultry during the winter all houses and coops should be put in good condition, only healthy fowls placed in the buildings and good care given to the poultry. The houses should be thoroughly cleaned, disinfected and made tight for winter. If the house has a dirt floor it is well to remove three or four inches from the top and substitute fresh gravel or sand. If the floor is cement or wood remove all litter and dirt and put in four or five inches of fresh straw or litter. Be sure that the house is tight on three sides and that there is no chance for a draft to strike the hens. If hens roost or are placed in a draft during the fall and winter colds are sure to develop which may result in roup and other troubles. The south side, or front, of the poultry house may be left comparatively open, but should be under control, so that the openings may be closed gradually as the weather becomes cold. Have muslin curtains in the front of the house, or leave a window partly open even on the coldest nights to allow some ventilation in the house. Fowls will stand considerable cold air provided it is dry and ventilation will keep the air thoroughly dry in the house.

The pullets should be brought in off the range and put in winter quarters, but before they are mixed with the older fowls be sure that the hens are banded or that the web of the foot is punched in some way so as to distinguish between the pullets and the hens. In this way the older stock may be culled out whenever it appears desirable and the young hens kept for further laying. Cull the chickens which are brought into the laying house carefully and fatten and market all chickens which are small, poorly developed or in poor condition. These small, poorly developed chickens are apt to catch cold if put in with the other poultry and develop diseases which quickly spread through the flock. Market all surplus cockerels or older male birds which are not desired for breeding or not wanted for a later market.

Feed the grain in a deep litter on the floor and make the hens exercise for all of their grain. The mash may be fed either wet or dry and should be so regulated that the fowls will get about equal parts of mash and of the scratch grains. It is necessary to give the fowls plenty to eat to get good results, but the birds should always be eager for each feed. In cold weather feed about one-third of the scratch grains in the morning and two-thirds at night. In this way the

Tells why chicks die

E. J. Reefer, the poultry expert, 4481 Reefer Bldg., Kansas City, Mo., is giving away free a valuable book entitled, "White Diarrhoea and How to Cure it." This book contains scientific facts on white diarrhoea and tells how to prepare a simple home solution that cures this terrible disease over night and actually raises 98 per cent of every hatch. All poultry raisers should certainly write Mr. Reefer for one of these valuable FREE books.

Our Next Serial

"Hepsey Burke"

A Sister to David Harum

Written by the brother of the man who wrote the original, the most interesting and the best-selling book of the last thirty years.

Did you ever read "David Harum?"

If so, you will not want to miss a page of "Hepsey Burke."

If not, you will enjoy your introduction to the family.

In either event you have a big treat in store, for "Hepsey Burke" is far and away the best serial ever run in any farm paper.

We will begin the serial publication of "Hepsey Burke" in these pages in two or three weeks.

CHOICE BOURBON RED TURKEY TOMS, $8 00: hens $3.00. Address Herman Ihde, Neenah, Wisconsin.

hens are forced to exercise more than if they receive all the grain they desire at the morning feed. Scratch grains, mash or ground grains, animal protein, green feed, grit and shell should be supplied in the winter. A good scratch mixture may be made of equal parts, by weight, of cracked corn, wheat and oats; and a mash may be made of two parts corn meal and one part each of wheat bran, wheat middlings and beef scrap. Green feed, such as cabbages, mangel wurzel beets, cut alfalfa or sprouted oats should be supplied to replace the green feed which the fowls have been securing in the fields; and beef scrap, skim milk, cut green bone, or some similar feed is needed to replace the bugs which the fowls have been getting on the range. Beef scrap or feed of this nature is very essential in securing a good supply of eggs during the winter months.

Clean the dropping boards at least once a week and spray the roosts with kerosene or some commercial preparation for killing mites once a month during the winter. Have a good supply of sand or dry dirt on hand to use on the dropping boards during the winter.

If any of the birds develop colds put as much potassium permanganate as will remain on the surface of a dime into a gallon of water and keep this mixture in their drinking water for several days, or until the symptoms of the colds have disappeared. Remove any sick birds from the flock as soon as they are noted and treat them in coops by themselves or kill and bury them if they are not worth treating.

Examine the pullets and hens for lice, and dust thoroughly with a good insect powder or apply a mixture of two parts of vaseline and one part of mercurial or blue ointment, about the size of a pea, one inch below the vent of the bird, rubbing the mixture lightly on the skin. An application of this ointment two or three times a year will keep the fowls free from lice. Where insect powder is used it should be applied three or four times a year, or oftener if the fowls become infested. Provide a small box in the house partly filled with dry road dust or fine dirt in which the hens may dust, thus helping to keep themselves free from lice.—[Department of agriculture bulletin.

FEEDING FORMULA FOR LAYING HENS.

The poultry department of the Connecticut station is now in the midst of its fifth egg-laying contest. As the ration is the most important factor in a contest of this kind our readers will be interested in what the hens in this contest are receiving in the form of mash, as well as dry grain. The dry mash is composed of wheat bran, 100 pounds; corn meal, 100 pounds; ground oats, 100 pounds; flour middlings, 100 pounds; fish scrap, fifty pounds; beef scrap, fifty pounds. In addition, they are fed dry grain composed of equal parts of wheat and cracked corn.

By simply varying the proportion of grain to mash, it is believed that these rations can be easily adapted to a number of different breeds. During the first two years the grain ration was fed in a well-known automatic feeder which was open a part or nearly all day, depending somewhat on daily climatic conditions, but largely on the season. While the hoppers gave fair satisfaction, the management of the contest feels that an experienced man always on the job is able to keep in closer touch with the birds and get better results by hand feeding, and in consequence the latter practice is now being followed. During the greater part of the year, the principal feed is given about four o'clock in the afternoon, but in winter one or more light feeds should be given in the morning to induce exercise. Dry mash is kept before the birds at all times in earthenware hoppers which are supplied with a wire grate to prevent the feed from being scratched out and wasted.

It will be noted from the mash formula that both fish and beef scrap are used; if either is omitted the other should be doubled. If sour milk can be supplied abundantly, the meat part of the ration may well be reduced by one-half or more. Grit, shell, and charcoal are supplied freely in rectangular boxes with three compartments each containing about a quart. Green food during the winter consists principally of mangel beets fed daily; in summer the birds have grass runs. Rape and Swiss chard are grown to supplement the summer supply of natural green food.

Get The Sled That Doesn't Tip

The real anti-tip sleigh that will at once appeal to sleigh users. Runners turn on pivots just below the beam which always carries load directly over runners regardless of how team is turned and always carrying load on four corners.

The West Bend ANTI-TIP Oscillator

has, besides the anti-tip features, many other features, individual to this sleigh only. It is very flexible—pulls out of ruts much easier—takes the pulling and backing strain off runners and distributes it uniformly through center of sleigh which makes sleigh run easier and back freely like a wagon. It dodges trees and obstructions far easier. It is stronger and more durable owing to weight distribution. Requires no bolsters, which brings box 6 inches closer to ground, yet gives higher clearance below beam. Simplicity gives it durability far beyond any other sleigh. It has been tried out and found to be perfect in every respect.

Ask your dealer to show you a West Bend ANTI-TIP or write us for full details.

SHOW AT SUPERIOR.

The Douglas County Poultry Association will hold its annual show at Superior January 18th-21st. This was decided at a recent meeting of the association when Robert Kardman was elected superintendent of the show. About $800 in prize money will be given out this year. This is about $300 more than the list last year and about $200 more than has ever been given out before. Programs and prize lists will be ready for distribution in about a week. Members of the association are very enthusiastic over the prospects for the show and it is expected that this will be the largest exhibition ever held in the county.

FOND DU LAC SHOW.

The Fond du Lac Poultry and Pet Stock Association will hold the 1916 show January 13th to 16th inclusive in the armory. It is also planned to have a kennel exhibit on the last two days, the dogs to be quartered in a separate hall, probably one of the big rooms in the armory basement. Prospects for a record-breaking show are unusually bright.

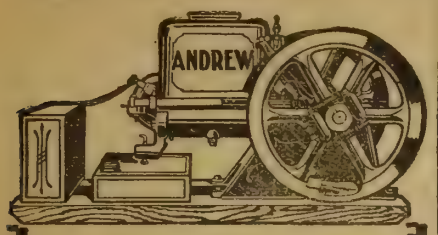
LAW QUESTIONS.

Tile in Roadway.

A Subscriber, Muscoda, Wis.—I have a pond on my farm which I wish to tile drain, but in order to do this I must lay tile along a public highway to the river for an outlet. Said highway passes through land owned by a neighbor. Must I get the consent of my neighbor, or of the town board in order to place tile along the side of the highway?

Answer.—You should get the permission of the town board and the road overseer to place the tile in the road.

When writing to advertisers please mention The Wisconsin Farmer.



ANDREW

Gasoline Engine

Here's an engine built specially to meet the conditions of small engine work. Cylinder is cast separately from the frame and made of the same close-grained iron used in six-cylinder automobiles—giving great strength with light weight. All parts are constructed of the best material obtainable. Crank shaft and piston are ground to ⅛ and ¼ one-thousandths of an inch. All gears machined and accurately cut. Fly wheels make up about half of weight and are fully machined and carefully balanced.

Only one size—

11-2 Horse Power

equipped with battery or magneto, as specified.

The more you know about gasoline engines the better you will like the ANDREW ENGINE. It gives maximum power for size of bore and stroke, has large water hopper and is extremely simple in design. It operates with ease on the farm or elsewhere all the various machines usually run by an engine of this size—churns, separators, pumps, feed cutters, polishing wheels, dynamos, etc.

Write for our new booklet and get full specifications. **Dealers Wanted.**

WISCONSIN SOIL SURVEY.

A survey of the soils of the state is being made—county by county—through the co-operation of the United States Department of Agriculture, the agricultural experiment station, and the Wisconsin geological and natural history survey.

While it will take a period of years to complete the work much progress is being made. The Wisconsin surveys are being made on a basis very similar to that followed in the various states in which such work is being undertaken.

The survey in this state, according to W. J. Geib, who is engaged in the work, is being made along two lines; first, a general survey of the northern and less well-developed portions of the state, and second, a detailed survey of the southern and older portions. The northern part of the state has been divided into five areas.

The first area includes Portage, Wood, Clark, Taylor, Marathon, Lincoln and portions of Price and Langlade counties. This area, the general survey of which was made a number of years ago, is being revised and mapped in greater detail, and a new report will be available soon.

The second area includes Polk, Barron, Rusk, Chippewa, Eau Claire Dunn, Pepin, Pierce and St. Croix counties, and the map together with a report on this area has been widely distributed but the supply is now exhausted.

The third area includes Burnett, Washburn, Sawyer, Douglas, Bayfield and most of Ashland counties. This report is now being distributed.

The fourth area includes Forest, Florence, Marinette, Oconto, Langlade and Shawano counties. The analysis of the soil in this area has not been completed, but the map and report will probably be ready for distribution some time during this winter.

The fifth area, including Oneida, Vilas, Iron, Price and the eastern portion of Ashland counties has been surveyed, and the map and report will probably be ready for distribution next summer.

In the detailed survey in the southern part of the state the field work has been completed in Waushara, Waukesha, Iowa, Fond du Lac, Buffalo, Columbia, Juneau, La Crosse, Kewaunee, Jefferson and Dane counties. The reports on Waukesha, Waushara, Iowa, Kewaunee, La Crosse, Fond du Lac, Juneau, Dane, Buffalo, Jefferson and Columbia counties are now available.

A special report has been prepared on the northeastern portion of Bayfield county along the bay and including the islands, in which considerable development of the fruit industry is taking place. This is now available for distribution.

Available reports may be secured from A. R. Whitson, of Madison, or from the bureau of soils in Washington.

The soil surveys are becoming more detailed and complete. Northern Wisconsin has some very rich and virgin soil, and by results obtained by the agricultural experiment stations and the farmers, it will be shown that those who have ignored northern Wisconsin for Canada and other sections of the country have overlooked regions of rich and promising lands.

Just Off The Press--Your Copy Is Ready!

A Postal Gets It!

This Book Will Save You $100 to $500 in 1916

THIS BOOK IS YOURS FOR THE ASKING

Get this big, new, four-color book of Galloway bargains. A postal brings it to you. Compare the prices and quality of goods I offer with those you're used to buying and figure out the saving for yourself. Big saving on household goods, implements, machinery, vehicles, harness, clothing, etc., in addition to wonderful bargains in Gasoline Engines, Cream Separators and Manure Spreaders. Mail the postal today.

1916 Sanitary Cream Separators

If you knew all there is to know about separators you couldn't build a better one—one that would run easier, skim closer or be better in material, more durable or more satisfactory. You couldn't build as good a one at a lower price, either. Where other machines are good the New Sanitary is as good, or better. Where they're wrong, it's right. If the New Sanitary is as good as I say it is, you can't afford to buy any other. If it isn't, I couldn't afford to offer it on ninety days' trial and guarantee for ten years against defective material and workmanship. Read the complete description in this big, new, 250-page book of bargains.

Masterpiece Engines at

26.75 - 34.50 - 39.50 - 72.50 - 98.75

My unequalled, 1916 Model, Masterpiece Six Horsepower Engines have taken the field by storm. Biggest of all engine values. Other Models from Four to Sixteen Horsepower equally good. One and Three-fourths to Two and One-fourth Horsepower pumping and light work engines built right and priced right. Don't get fooled on high speed, light weight engines. Insist on heavy weight, large bore, long stroke and slow speed when you buy. The new 250-page book tells why—write for it.

New 1916 Spreaders Now Ready

Wider, finer spreading than ever. All steel, double pulverizing beater. Lighter draft, low down, double chain drive, cut under front wheels, channel steel frame, trussed like a steel bridge, steel tongue, endless apron, force feed, top of box 42 inches high, latest model V-rake. Five selling plans—cash or note. All fully described and priced in the Galloway book.

The Closed Car on the Farm.

THE old-style closed car was built chiefly for show. It was very high in price and the cost of operation was excessive. For these reasons the closed car earned the reputation of being extravagant. Farmers did not take to it. The big, heavy top encouraged swaying, and after a few weeks of driving over country roads, such a car would develop so many squeaks and rattles and groans as to spoil the pleasure of riding. But a new kind of closed car has come into existence which is popular both among the farmers and in town. One leader of the new "school" is the Jeffery Sedan, made by the Thomas B. Jeffery Company, of Kenosha, Wis. The top weighs only 200 pounds, and the complete enclosed car, taking into consideration the removal of the summer top, which weighs nearly 100 pounds, tips the scale at only about 100 pounds more than the open car. Four years ago the Jeffery people felt the demand for an entirely closed car, protecting all passengers from the weather. The man who drives his own car does not like to drive from the outside, as is the practice in the limousine type, particularly in snow storms or in zero weather. Accordingly the Jeffery Company built an entirely closed car. The front seats were divided, doing away with the necessity of foredoors and permitting larger forward windows. This gives the driver a broader vision. The Jeffery people held a contest, and the name which won was "Sedan." The type of car proved popular and the name soon became common to all cars of similar type. The top of this Jeffery is built entirely in the Jeffery factory, expressly to fit each car as it comes through. By this method the squeaks and rattles are eliminated. The top is easily removed, giving an open touring car at the first suggestion of warm spring weather. One important feature of the new Jeffery is the low price. So it is that farmers with their wives and daughters are traveling this winter in real warmth and comfort—safely sheltered from bleak winds and driving snow, sleet and rain—warm as toast—with wide panes of crystal glass to protect and give an unobstructed view instead of troublesome and leaky curtains to obstruct their vision. Hence the increasing popularity of the closed car on the farm. —Adv.

Pinehurst Dairy Guernsey Herd.

THE Pinehurst Dairy, Sheboygan Falls, Wis., is one of the finest if not the finest dairies in the middle West. This dairy is owned by Peter Reiss, Sheboygan, Wis., of the well-known firm of C. Reiss Coal Co. Several years ago Mr. Reiss purchased one of the best farms and herds of cattle in Sheboygan county. It lays right on the edge of the residence section of Sheboygan Falls, and consists of close to 500 acres of land. Not content with the fine buildings which were already on the farm Mr. Reiss set out to erect the most modern and sanitary dairy buildings that experts could devise. No pains or money were spared to install the most modern equipment. A few choice Guernsey cows are kept in addition to the herd of Holsteins. The Guernsey herd is headed by Imp. Royal George of the Isle 30551, and a number of his yearling sons are now offered for sale. These bulls are well grown, of good type and well marked. They are out of imported cows of Governor of the Chien line of breeding. Pictures and description of these bulls will be sent on application. See this page.—Adv.

Laird's Hampshire Sale.

A PUBLIC sale of Hampshire swine will be held by A. M. Laird, Prairie du Chien, Wis., on January 21st. We especially call our reader's attention to this sale, as the animals to be sold are of exceptional merit. The sale will consist of forty head of bred sows and gilts. The majority of these are daughters of "Laird's Rexall" a boar of outstanding merit. Mr. Laird recently sold this boar for $250 to Joseph Clemens, Kansasville, Wis. These sows and gilts are not only of choice breeding, but are safe in pig to Mr. Laird's junior herd boar, Kornfalfa King, that took junior champion honors at the 1915 Wisconsin State Fair. He is a boar of exceptional merit, having a deep, wide barrel, deep, thick hams, a short, wide head and heavy bone. Litters sired by him will prove very valuable. Attend this sale if in the market for Hampshires. See advertisement on page 29.—Adv.

Green View Short-horns.

THE Green View Stock Farm, Spring Green, Wis., owned by J. H. Bear & Son are offering some very attractive bulls for sale on page 31. One of these is Royal Sultan 390142, a grandson of the noted bull, Whitehall Sultan. He is an excellent individual and a credit to his worthy grandsire. His sire, Spicy Sultan is one of the few remaining sons of the great bull. Royal Sultan is a bull of excellent quality and great size, weighing 2,250 pounds the day he was three years old. He is a massive, deep-bodied animal of roan color. Several of his yearling sows ready for service are also being offered for sale and are red, roan and white in color. They are out of cows of Duchess of Gloster, Arabella, Favorite Beauty and Bates breeding. They are of good size and of smooth, fine quality. For further information in regard to breeding and price write to the above address.—Adv.

Upland Farms Holsteins.

THE Upland Farms, Walworth, Wis., are advertising some exceptionally good yearling bulls for sale on page 31. These bulls were sired by Sir Pontiac Artis Duke 77994 a richly bred bull of good individual merit. His sire, Sir Korndyke Pontiac Artis, has forty-five A. R. O. daughters, twenty-three with records from twenty to 30.13 pounds of butter in seven days. His sire's sire, Sir Korndyke Manor De Kol, has forty-seven A. R. O. daughters, three with records over thirty pounds. His sire's dam, Pontiac Artis is a 31.71-pound daughter of Hengerveld De Kol, that has 117 A. R. O. daughters, nine with records over thirty pounds. His own dam, Pleasant Hill Nellie Veeman Duchess made 27.14 pounds of butter in seven days and has two A. R. O. daughters, one with a record of 28.36. His dam's sire, Sir Veeman Hengerveld, has sixty-six A. R. O. daughters, seven with records above thirty pounds and forty-two with records from twenty to 33.69 pounds. From the foregoing it will be seen that this bull is backed by exceptionally high producing blood. The young bulls themselves are good individuals in every way, being well grown, of good, straight type and well marked. Several of them are out of A. R. O. dams, with creditable records. Pictures, description and extended pedigrees will be sent on application.—Adv.

ONE OF THE GUERNSEY BULLS ADVERTISED FOR SALE ON THIS PAGE BY PINEHURST FARM, SHEBOYGAN FALLS, WIS.

Truttschel Brothers' Holsteins.

TRUTTSCHEL BROS., Sheboygan Falls, Wis., have an exceptionally fine herd of Holstein cattle. The cows are of good type, large size and heavy producers. The latter fact was demonstrated last year when thirteen cows made records that averaged over twenty-three pounds of butter in seven days, three of these cows were two year olds and only one had attained full age. The bull at the head of the herd is Elmer Johanna Wit, a richly bred bull, whose dam is a 100 per cent the same blood as the forty-pound cow, Johanna De Kol Van Beers. They are now advertising yearling bulls ready for service and some younger bulls for sale on page 31. These were sired by Elmer Johanna Wit and are out of cows with records of 21.70, 21.67, 23.77 and 24.48. For extended pedigrees and further information write to the above address.—Adv.

McNutt's Holsteins.

REGISTERED Holstein heifers, heifer calves and young cows are advertised for sale on page 31 by H. F. McNutt, Oxford, Wis. They are choicely bred, tracing to such bulls as Hengerveld De Kol, that has 116 A. R. O. daughters, nine with records above thirty pounds. The heifers and cows are bred to the forty-pound bull, Johanna King Segis, that is a son of the first forty-pound cow of the breed, Johanna De Kol Van Beers. She and three of her sons sold for a total of $62,000. Yearling bulls ready for immediate service from A. R. O. dams with records from fourteen to thirty pounds of butter in seven days are also offered for sale. For extended pedigree and further information in regard to these animals write to the above address.—Adv.

Knudson's Guernseys and Durocs.

THE Guernsey cattle and Duroc swine advertised by Allie S. Knudson, Broadhead, Wis., are as good as will be found in the state of Wisconsin. They are well bred and of excellent individual type. The Guernseys are of Rilma, May Rose and Glenwood lines of breeding. The Durocs were sired by Village G., a litter brother to the $2,000 champion boar, Illustrator, and are out of dam of Crimson Wonder and Colonel lines of breeding. Village G. is one of the best boars of the breed. He weighs 1,000 pounds and yet is of good, smooth quality. He has a short, wide head, wide, deep body and thick, deep hams. Our readers will be highly satisfied with any animals purchased from this farm. See this page.—Adv.

Bloomington's Big Horse Sale.

THE breeders' sale, January 25th-28th, will be held in the Coliseum at Bloomington, Ill. Catalog has gone to the press. There will be offered some of the very best bred Percherons, Belgians, Shires, Clydesdales and trotting bred horses, Shetland and Welsh Ponies from noted breeders, who have agreed to bring some of their stallions and mares for this sale. Manager Hunt writes: "We will probably not have the large number of previous years, but will have the largest sale of draft horses that will assemble in 1916, with more quality and finish and breeding of the best. Among the consignors will be Maple-L-Stock Farm, Innisfail Farm, D. Augstin & Sons, Sunny Plain Farm, Rowe Bros., G. B. Loper & Sons, Wm. Day, H. G. Bowers, E. R. McKown, A. W. Blue, J. W. Otto, Leroy Knight, C. Becker, Harold Keys, H. J. Campbell, Albert Klett, J. W. Barclay & Son, W. H. Coultrip, John McClelland, Alfred Phillips, Walter Severs, W. C. Seibel, F. E. Tollinger, R. G. Crum, A. H. Springer, D. S. Forrest, A. E. White, O. R. Thompson, Lewis Lang, W. L. Candor, Dr. C. A. Hendrickson, John W. Stubblefield & Sons, I. C. Evans and sixty other consignors. We have a number of imported stallions and mares in this sale. We also have stallions of all breeds that are fit to head any stud, and mares of the same class. Ponies and trotters will be of the usual number and sell on Friday, January 28th. They are consigned by: W. C. Adams, Dixon Pony Farm, Jones Bros., M. P. Lantz, Chas. M. Strawn, R. B. Ross, and others. Catalogs ready January 12th, and everyone urged to be present at the sale." Catalog can be secured by addressing C. W. Hurt, manager, Arrowsmith, Ill., as per the advertisement on page 30. Kindly mention this paper when you write.—Adv

Denver Short-horn Bull Sale.

FIFTY registered Short-horn bulls of strong ages will be offered at public sale at the Western Live Stock Show, Denver, Colo., Wednesday, January 19th, under the auspices of the American Short-horn Breeders' Association. Consignments will be made by Carpenter & Ross, C. A. Saunders, W. R. Mansfield, A. O. Stanley, E. W. Harmon, H. Rees & Sons, Wm. Herkelmann, Theo. Martin, Henry Stunkel, D. Warnock & Son, and C. C. Cockran & Sons. This is an offering of good individuals and should draw buyers requiring a good class of registered Short-horn bulls. The auctioneers are Carey M. Jones and Theo. Martin. Any desired information can be secured by addressing American Short-horn Breeders' Association, Union Stockyards, Chicago, Ill.—Adv.

Lorenz's Holsteins.

TEN registered Holstein heifers, two registered cows and four high grade are advertised for sale on page 31 by Adam Lorenz, Sheboygan Falls, Wis. The heifers range from one to four months of age, are well marked and of good straight type. The two registered cows are both short one-quarter of an udder and are being priced very reasonably on that account. This will furnish an opportunity for beginners to get a foundation herd at very little expense. Mr. Lorenz is also offering yearling bulls ready for service that are well bred and of good type. For pedigrees and further information write to the above address.—Adv.

Connor's Yorkshires and Poland Chinas.

YORKSHIRE and Poland China fall pigs eight weeks of age are advertised for sale at very reasonable prices on page 30 by R. C. Connor Company, Marshfield, Wis. They have one of the best herds of Yorkshire swine in the middle West, having selected their breeding stock with care and discrimination and develop the young stock into large, growthy individuals. Our readers who wish to get into the breeding of registered swine at very little expense are offered an exceptional opportunity. For further information write to the above address.—Adv.

Edgewater Stock Farm.

HIGH-GRADE Holstein and Guernsey springers and fresh cows and bred yearling heifers are advertised for sale on page 31 by the Edgewater Stock Farm, Ft. Atkinson, Wis. They maintain a herd of over 300 animals of heavy production ability and good individual merit. Whatever our readers may need in the line of registered or high-grade Guernseys or Holsteins may be found at this farm. For further information in regard to the animals now being offered for sale write to the above address.—Adv.

Percherons and Belgians.

THOSE of our readers who are thinking of purchasing a good, imported or home-bred Percheron or Belgian stallion, should by all means visit the barns of Hart Bros., at Osceola, Iowa. These gentlemen have a splendid lot of stallions on hand, as well as a lot of imported and home-bred Percheron and Belgian mares. Their barns are located right in town where these horses can be seen at any time. They will be pleased to correspond with you and will tell you what they have on hand. When writing them kindly mention this paper. See page 30.—Adv.

Butts' Chester Whites.

CHOLERA immune Chester White spring gilts and yearling sows bred for March and April farrow are advertised for sale on page 30 by William F. Butts, Evansville, Wis. The females offered for sale are bred to a son of Hinshaw, that won championship honors at the 1914 Wisconsin State Fair. For pedigrees, description and further information write to the above address. —Adv.

Capener's Guernseys.

REGISTERED Guernsey bulls, ready for immediate service, are advertised for sale on page 31 by Clifford Capener, Baraboo, Wis. These young bulls are well bred and good individuals throughout. They are being priced reasonably and we advise our readers to act quick if they want one. For pedigrees and description write to the above address.—Adv.

Schoenfelds Short-horns and Poland Chinas.

REGISTERED Short-horn bulls and heifers and Poland China boars and sows are advertised for sale on page 31 by C. J. Schoenfeld & Sons, Fox Lake, Wis. For further information write to the above address.—Adv.

Drake's Short-horns.

The SHEKLETON ORGANIZATION

IMPORTERS AND BREEDERS OF PERCHERON, BELGIAN AND CLYDESDALE..... STALLIONS AND MARES

NEVER before have we been able to place before the public such a large bunch of imported and American bred stallions. We own six farms—1,180 acres devoted to the horse business. A lifetime in the horse business has taught us that the best is none too good for the American farmer, and we are making no strong claim when we say that our horses are among the best that will be seen in any importing barn this season. Our horses are all ages, sizes and colors; weigh from 1,800 to 2,300 lbs. Anyone thinking of buying a stallion will save money by writing for our prices and descriptions. We can supply you whether you need one or a carload. We have all our own help, therefore, this 1,180 acres enables us to raise all our own feed. We handle all our horses, do all our selling, have no middlemen to divide profits with. Consequently we can save you more money in buying a stallion than our competitors. Lawler is in north central part of state, easily accessible from all points in northern Iowa and Minn. Best of R.R. facilities, being on I.N.D.Div. of C.M.& St.P. between Mason City and McGregor. All stock guaranteed breeders. **FRANK P. SHEKLETON & SONS, LAWLER, IOWA.**

HOLSTEIN-FRIESIAN CATTLE.

WANTED CALF RENNETS FARMERS and BUTCHERS Do Not Throw Away the Rennets if you kill over ten calves per month, but write us. THE MARSCHALL DAIRY LABORATORY Madison, Wis.

Purebred Registered **HOLSTEIN CATTLE**

Probably the longest and most exhaustive tests of dairy cattle in the world, made by the Wisconsin Experiment Station, showed that the registered purebred Holstein-Friesian cows far exceeded all other breeds when the tests were extended over a number of years, due to their more regular breeding, and higher uniformity of butter production every year. The Holstein cow Johanna in a five-year test averaged 480.81 pounds of fat and an average yearly net profit of $90.17. Investigate the big "Black-and-Whites."

Send for FREE *Illustrated Descriptive Booklets*

Money Savings Multiplied By Our "Different Methods"

Never before, in our eventful career, have we been able to offer you such tremendous money saving opportunities. The countless thousands, of shrewd posted buyers, who are familiar with our original and different methods of purchasing, know the reason for this—but do YOU know why?

The reports of the Mercantile Agencies tell a story of business disasters, for 1915—a story repeated year after year—and here's where we come in. We profit by the business disasters of others. Manufacturers of good goods all know where they can quickly dispose of their stocks, no matter how large, for ready cash. No auction or forced sale of any importance takes place without our knowledge and the presence of our buyers. During the closing months of 1915 our $10,000,000.00 buying power gave us an overwhelming advantage in effecting many of the greatest purchases we have had the good fortune to make since we launched this business 23 years ago.

Buy like we do—nothing but bargains. Share the benefits of our great Price Wrecking system. You can safely select anything from this page or the free bargain books below, because everything we sell is backed by our $10,000,000.00 satisfaction or money back guarantee. Mail the coupon and start saving now—today.

We Now Present the

Patented by Hudson
December 28, 1915
Patent No. 1165801

Hudson Super-Six

76 Horsepower—an Added 80% Without Any Added Size

These Stock Car Records Officially Broken

The Hudson Super-Six—7-passenger touring car model—at Sheepshead Bay Speedway in November, officially broke all stock car records up to 100 miles. Also all records for quick acceleration, under American Automobile Association supervision—as follows:

100 miles in 80 minutes, 21.4 seconds, averaging ***74.67 miles per hour,*** with driver and passenger.

The previous best record was made with driver only, with a larger motor and more cylinders.

75.69 miles in one hour with driver and passenger.

Standing start to 50 miles per hour in 16.2 seconds.

Mark what those records mean.

No other stock car in history has equalled that performance. No other like-size motor has ever developed such power.

The Super-Six has proved itself the greatest engine ever built. It has outrivaled Eights and Twelves. It has almost doubled the efficiency of Sixes.

And this motor is a Hudson patent, found in Hudsons only. So it means that Hudson cars hereafter hold the highest place in Motordom.

80 PER CENT MORE POWER

Let us compare it with the Hudson Six-40, long the leader among Sixes. That Six-40, by its matchless performance, in two years quadrupled Hudson sales.

The Super-Six is identical in size. No added cylinders, no extra complications. Lightness and economy remain.

But the Super-Six develops 76 horsepower. Best earlier type sixes of like size developed but 42 h. p.

And all that increase—that added 80 per cent—comes through wiping out vibration.

ADVANTAGES OF HIGH POWER

You ask why you need that 76 horsepower if you don't care for high speed.

You need it because it means vast reserve power, to mount hills without effort, to make hard roads easy, to avoid changing gears. Also it enables you to creep on high gear, and to pick up with record quickness.

And it all comes through lack of vibration. So it brings with it bird-like motion. The motor is so smooth that the car seems to move by magic.

OTHER TYPES DISCARDED

We stopped production on former Hudsons when the Super-Six proved this supremacy. Thus we lost over $6,000,000 in sales last fall. We also stopped our experiments on Eights and Twelves.

Then we doubled our factory to meet a doubled demand. And we bought materials for $42,000,000 worth of these new cars for this season.

All because the Super-Six is bound to dominate hereafter. Its performance is resistless. Any buyer of a high-grade car will choose it when he knows the facts It will also win thousands from lower-grade cars to the Hudson.

A LUXURIOUS CAR

The Super-Six looks its supremacy. In every detail we attain luxury's limit, regardless of the cost. The new body lines are perfect. The finish is superb. In the upholstery we use a rare grade of grain leather. Each compartment of the Phaeton has a rounded, finished dash.

At no price is it possible to offer more of luxury and beauty. Yet our mammoth production brings the price to $1375. That for a car which must be conceded the greatest car built today. Go see it at the nearest Hudson Showroom.

The Wisconsin Farmer

THURSDAY, JANUARY 13, 1916.

FAMILY CIRCLE TALKS
BY THE PUBLISHER

GOOD CLUB TOPICS.

I AM quite interested in the discussion of a farmers' neighborhood club of which I know. The program committee is certainly giving the members splendid programs this winter, arranging a number of practical, interesting topics and having them discussed by the men best posted.

For instance, here is a brief report of the last meeting, kindly sent me by one of the club members:

Our club, after considerable discussion, went on record in favor of the installation of rural ice routes and the delivery of ice to farm homes. The club also favored the elimination of the franking privilege granted congressmen as a means of increasing the revenue of the postoffice department. The club will debate at the next meeting the question of whether a co-operative laundry could be maintained successfully in the country and whether it would be advisable for farmers to set aside a few acres in which catalpa and other lasting varieties of timber could be grown for wood and posts.

A program which includes such topics as these is valuable and interesting, indeed. I do not know of any factor in country life betterment today in which I have greater faith or which I believe destined to greater success than these farmers' neighborhood clubs discussing just such subjects as these. None of the mail which comes daily to my desk gives me greater pleasure in the reading than just such letters, telling of such neighborhood club meetings. I want to urge on all my friends that they give me reports of their clubs; they are interesting and inspirational to me in the highest degree.

I do not want to proffer unasked information or advice, but I do want to suggest to those who are interested in the question of co-operative laundries that they investigate the success of the plant at Chatfield, Minnesota. You may recall that we printed a full-page feature story, with pictures, describing the working of this laundry, in this paper about two years ago. If those who are interested have not preserved the paper containing this article they can probably get the desired information by writing direct to the manager at Chatfield. The last report I had showed the experiment to be a splendid success, dispensing with "blue Monday" in many a farm home around Chatfield.

I have had reports of very successful rural ice routes which have operated in Kansas for the last two or three years. It is a little chilly to be thinking about ice nowadays, but next July and August ice will be a positive necessity on hundreds of thousands of farms. We do well to discuss it while there is time and opportunity to insure a good supply for next summer. Personally I favor the idea of such ice routes throughout the country, and from what I hear they are extremely popular wherever tried.

Let us make our neighborhood clubs a forum for such discussions as these. They will then be still more important factors in making the farm a better place in which to live.

A JUMBLED MESS.

THE R. F. D. situation is becoming more muddled daily, owing to the persistence of the postoffice department in combining routes and its apparent refusal to consider farmers' protests. As I pointed out a few weeks ago, the matter is to be threshed out on the floors of congress, but in the meantime the farmer continues to get the worst of it.

My attention has just been called to the letter of a grain-belt farmer who asserts that since the rural route which serves him and his neighbors has been changed the patrons of that one route alone will have to travel more than 10,000 miles a year further than they did before to get their mail. The farmer who figured this out pertinently adds: "That is farther than the carrier has to travel during the whole year in making all his deliveries. But this is not all. There are only three patrons on the old route who have better mail service than before the change."

The idea underlying the R. F. D. service is that farmers shall have mail delivered daily as near to their homes as is possible. Farmers are not asking that the R. F. D. carriers drive up the lanes to their very doors, deposit the mail and then drive back again to the main road. But they are asking —and if they take my advice they will demand it, in the strongest way possible—that the routes be so arranged and maintained that the mail be left as near their places as possible, so as to necessitate little driving or walking on their part in order to secure it. When it is necessary to traverse a lane, a branch road and even some distance on the main road to reach the mail-box the value and the efficiency of the R. F. D. service have been so impaired as to be near the vanishing point. The farmer is entitled to far better service than this. Yet this is what the postoffice department is asking farmers to be satisfied with since they started the system of combining routes into fifty-mile ones, attempting to cover them, in all sorts of weather, with one carrier.

Nor is the trouble of going a considerable distance for the mail the only one nowadays. Another farmer-patron writes to complain that the present system is "the worst jumbled up mess I ever saw; our mail is from one to two days behind." This should not be permitted to continue, and I want to urge on all my readers that they write their congressmen, protesting vigorously against such inefficiency, no matter whether the change in policy affects them individually or not. It will affect them, in due time, if the postoffice department is not made to see the grave mistake it is making. But let us pull together to help the farmers who are affected, whether the trouble has reached us yet ourselves or not. For the good of farmers and farming generally the R. F. D. service should be maintained, not crippled; improved, not impaired.

EVIDENCES OF PROSPERITY.

EVIDENCES multiply, I rejoice to say, that prosperity is almost certain to continue throughout 1916, barring the unforeseen and the contingencies over which man has no control. I think it will not be time wasted if we consider some of these evidences for a minute, even if they do not deal with farmers and farming directly.

Last week, I note by the press dispatches, the United States Steel Corporation granted a 10 per cent wage increase, which means an expenditure of $15,000,000 more annually. The men at the head of this great concern are not public benefactors to the extent of granting this big increase if they did not see another year of contnued good times upon us, sufficient, in all probability, to bring them in many times the amount they have voluntarily decided to pay their workers. The official announcement of the wage increase attributes it to the "prosperous conditions now existing."

I frequently come across items in the various newspapers these days telling of railroads ordering new and better rolling stock and laying plans for the improvement of their roadbeds. They see big freight shipments and heavy passenger traffic ahead of them, good signs of prosperity. And here come the monthly reports from the twelve federal reserve bank districts, those from the grain belt being summarized in the press dispatches as follows:

Chicago reported general improvement in business, with manufacturers, retailers and wholesalers doing business on "an even more than normal basis."

Prospects throughout the St. Louis district were declared to be excellent in virtually every industry. Business men were reported generally optimistic, with wholesale interests in many lines showing gains. Railroads are employing more men, are showing increased earnings, and are buying more freely than for some time past.

The outlook for 1916 in the Minneapolis district was reported as excellent with all lines of business optimistic. The lumber trade continues to revive and again is approaching normal.

Kansas City reported that probably at no time in the history of the district had wholesale trade been so active and satisfactory. Unprecedented sales are being made by jobbers, and collections are far above the average. There had been a general movement of wheat to the market and, while the quality was somewhat disappointing, the price has more than offset that. Railroads in the district are using practically all their full rolling motive equipment.

My friends, I need hardly call your attention to the fact that all these signs of good times are most gratifying to me. Last year the farmers of America raised the most valuable corn crop and the largest wheat and oats crop ever grown. That insured prosperity for the farmers, a prosperity which is now reflected in a score of ways in other industries. Back of all these prosperity evidences (save, perhaps, the steel wage-increase, for which the European war may be largely responsible) looms the prosperity of the farm, upon which is based our permanent national wealth. So whether we are farmers or townsfolk we can look upon the reports of prosperity of our fellowmen and find comfort and cheer therein, for industries are so interwoven today that as one rises so do they all, as one falls so do they all. So whatever our calling in life, as we stand at the threshold of the new year, we can look about us and see good times abounding on ev[illegible] hand.

A GREAT, BIG, HAPPY FAMILY.

I AM in receipt of a Christmas letter from a cousin of mine in Ohio, a maiden lady whose beautiful and unselfish life is an inspiration to all who have the pleasure to know her. One sentence of what she wrote impresses itself particularly upon me. It is this:

To me there is a certain loneliness about the holiday season; I just have a sort of homesick feeling for the old days, when we were all at home, a great, big, happy family, out on the farm.

Are there not many among us who feel this way, at this season of the year? Are there not many who would give everything they possess, no matter how much of this world's goods, to have granted to them the plea of the poet:

Backward, turn backward, O Time, in your flight,
Make me a child again just for tonight!
Mother, come back from the echoless shore,
Take me again to your heart as of yore;
Kiss from my forehead the furrows of care,
Smooth the few silver threads out of my hair;
Over my slumbers your loving watch keep;—
Rock me to sleep, mother—rock me to sleep!

The family circle has a special significance during the holiday season. We miss those who have gone on ahead, either across the Great River or into the new lands where hope and fortune have beckoned them. There could be no Christmas gift to compare with their coming back home, to pull the accustomed chair from its long-idle place against the wall and to gather around the family table as of yore, before ambition, love, or that grim visitor who will not be forbidden, took them from our midst. Yes, there is a sadness about the season of the year which is the most glad; there is a vacant place at the table, or one is gone from our midst never to return, and we look at the picture on the wall through tears, the joy of living tempered with sorrow for those who have gone.

I imagine that my experience is a common one; as I grow older I find myself thinking more of childhood days and associates, of the things which had escaped my memory until now, when the hair is silvered and the years are many. At no time of the year do these thoughts come surging over me so overwhelmingly as during the holiday season. I long, with all my heart, once more to be, as my cousin so feelingly puts it, a member of the "great, big, happy family, out on the farm." With all that life has brought me, with all that it may still have in store for me, I cannot think of anything that would give me greater pleasure than to be "a child again," even if "just for tonight," and back where my childhood's happy hours were spent, the family circle still complete, before those awful years when sorrow stalked over the land, when a nation was in mourning, when my father, hearing the call of his country and answering it without hesitation, marched away, never to return, lying today in an unknown, unmarked grave, somewhere in the sunny southland. The family circle has been rudely shattered since those days, and never does the fact bear down upon me so heavily as at the time when all the world is gayest and hearts are beating highest because of holiday joy. The stockings hanging on the mantle, put there with childish faith in Santa Claus or adult indulgence in juvenile gayety, bear mute testimony to the ones who once did just as we are doing now, but who have left us and whose absence is so sorely missed at the holiday merrymaking. We think of them all the year around, but when Christmas comes we miss them with a poignant grief which sinks deeper into our hearts at this time than any other. We all go about pretending to be merry, even though at times our hearts are sad and lonely, but we must not mar the joys of the little folks with any word or look.

Still, there is a danger which we must all avoid; the danger of too much retrospection, too much living in the past. The sun is rising for another day and another and another; it is as bright as when I was a boy, life is full of promise and happiness. Let us all turn our faces toward the rising sun and at the threshold of the new year dedicate ourselves anew to making happy those around us before they, too, yearn for the days which are gone and the loved ones gone with them.

Backward, flow backward, O tide of the years!
I am so weary of toil and of tears,—
Toil without recompense, tears all in vain—
Take them and give me my childhood again!
I have grown weary of dust and decay—
Weary of flinging my soul-wealth away;
Weary of sowing for others to reap;—
Rock me to sleep, mother,—rock me to sleep!

Teaching Wisconsin Boys to Know Good Live Stock.

THE farmer who can walk into a strange herd of cattle and pick out the good ones offhand has an advantage which every breeder should endeavor to attain. There is no doubt but that many breeders, unable to judge good stock, have found this one of the great obstacles to overcome in the business, and the farmer with the knowledge of what constitutes a good animal is always at an advantage in either buying or selling. Of course, none of us can judge a cow's productiveness by merely looking at her or judge the speed of a horse with the eye, but the man familiar with the requirements of a good animal is pretty likely to hit a better bargain than the man who has to take the other fellow's word. So it is for this reason that the courses in judging which are now being given in the ninety odd high schools of the state with agricultural departments and the seven agricultural schools should prove of great value. Hundreds of farm boys are learning how to pick good stock and to encourage this work in judging the state has been divided into districts for the purpose of district contests which will be followed with a final state runoff during the Farm and Home week at Madison in February. These boys are not being trained especially for the business of stock judging, but are being shown this art with the hope that when they become breeders, buyers and sellers that they will, for their own good, be able to pick out stock which is up to standard. Every farm boy who has the opportunity to study stock judging should do so and should enter the contests which are held in connection with the county fairs, etc.

The contests now being conducted by the schools will create additional interest in the judging courses, and the plan is to pick teams of three men each who have been trained particularly in dairy cattle, swine and draft horse judging. Later it is planned to include all classes of live stock. The state has been divided into nineteen districts with district leaders and the winning teams from these districts will compete in the state roundup. The district leaders are: H. J. Ramlow, Bayfield; W. Hansen, St. Croix Falls; J. M. Hammer, Roberts; E. M. Boerke, Cumberland; W. W. Clark, Grand Rapids; James Coyner, Mondovi; Emil Rouchenstein, Omro; R. H. Cameron, Green Bay; A. C. Kingsford, Baraboo; T. H. Campion, Onalaska; Louis Schreiber, Sun Prairie; A. B. West, Janesville; F. A. Maas, Waldo; John Oosterhuis, Wauwatosa; Ralph Brown, Stanley; Paul Brown, Patch Grove; H. W. Jones, Dodgeville; T. G. Brown, Viroqua; C. E. Fawcett, Rochester.

The state committee consists of T. L. Bewick, of Madison; H. M. Goddard, state superintendent of schools; J. M. Gabagen, of Milton, and W. W. Clark, of the agricultural school at Grand Rapids. There is also a state advisory committee and it is expected that the state contest will develop much interest and at the same time instruct a large number of young men in the essentials of stock judging.

Wisconsin County Organization.

GEORGE C. HUMPHREY, of the animal husbandry department of the College of Agriculture, Madison, Wisconsin, spoke recently before the American Society of Animal Production at the annual meeting held at Manhattan, Kansas. He reviewed at considerable length the community organization's work for live stock improvement in Wisconsin. He expressed the opinion that community organization effects a saving of energy, time and money, and produces greater profit for all concerned. Such organization is of great educational force in bringing together people of a community and giving them an opportunity to profit by learning one another's experiences and hearing addresses on subjects pertaining to standards and practices of breeding, feeding and management. In closing his address, Mr. Humphrey said:

Community organization for live stock improvement offers most excellent opportunities for disseminating and introducing into practice results of investigations and research work.

In dairy cattle associations it encourages cow-testing work, places milk production on a business-like basis and forms a standard which cannot be excelled as a guide for the selection of breeding animals.

It provides a most economical system of advertising and offers special inducement for buyers seeking carload lots of animals.

It creates a greater demand for stock of superior merit and secures better prices.

In communities where better herds must be established it offers better opportunities for men to co-operate in buying and operating foundation stock.

It encourages a fight against disease and the adoption of methods for the prevention of disease.

It creates an interest in more permanent ownership of land and in community welfare.

It gives the farmer new ideas toward which to work and makes farm work more fascinating and enjoyable.

It affords better farm homes and a degree of prosperity that makes farm life most satisfactory and productive of highest results.

From the standpoint of research workers, it may be said that results of investigations which are of value in promoting animal production are of little importance until they are disseminated and become a part of actual practice on live stock farms.

Wisconsin Dairy Anniversary.

A SPECIAL feature will be made this year for creamery men, cheesemakers and dairymen in the short course at the Wisconsin College of Agriculture, February 7th to 16th. This is the twenty-fifth anniversary of the discovery of the Babcock milk test. Inasmuch as Dr. Babcock was connected with the Wisconsin College of Agriculture at the time the discovery was made, and is still an emeritus professor, it is very fitting that special prominence be given to this dairy course on the twenty-fifth anniversary. The first instruction in the use of the Babcock test was given at the Wisconsin College of Agriculture. Now the Babcock test is used around the world.

In connection with the special course at Madison there will be held an exhibit of dairy products and machinery in the stock-judging pavilion of the agricultural college. This will illustrate the development of dairying during the past quarter of a century and various stages of manufacture through which many of the pieces of dairy machinery have passed. All divisions of the dairy department will be in full operation during the week of this special course.

Announcement concerning the course state that there will be daily conferences on dairying and cheesemaking. There will be demonstrations on grading, testing and cheesemaking. There will be demonstrations on grading, testing and pasteurization, by both the holder and the continuous processes. During the special course cheese will be made daily, so that the experienced cheesemaker may follow the process from beginning to end.

Some of the points to be emphasized are the following:

1. The influence of moisture content of the curd on the quality of the cheese.
2. A method of branding cheese.
3. Pasteurized milk cheese. A good supply of pasteurized milk cheese for scoring will be on hand and the characterized uniform quality as well as the increase in yield of such cheese will be discussed.
4. Paying for milk by its test at cheese factories. A new plan of payment for rich and thin milk at the same factory has been worked out and this will be discussed in detail as well as a simple method of keeping the cheese factory daily records.

Many Good Things to Read.

AS USUAL The Wisconsin Farmer presents many interesting articles this week for the farmers of this great state. There are now more farmers taking this paper than any other farm paper published in this state, and the publisher and editors feel an added sense of responsibility. It is our purpose to make The Wisconsin Farmer more interesting this year than ever before and to keep pace with the rapidly developing farming interests of the state.

Reports of the Wisconsin State Horticultural Society meeting and show, the Wisconsin Poultry Association meeting and show and the Wisconsin Cheesemakers' meetings will be found in this issue. On account of the liberal advertising patronage this week The Wisconsin Farmer is forty pages. The Wisconsin Farmer publishes many more pages during the year than any other Wisconsin farm paper, and also many more columns of reading matter and many more illustrations.

Our letters from subscribers found in this issue and other issues will be of great interest and should be read by every farmer. In this way we carry the views of our readers from one to another.

The Wisconsin Farmer appreciates the splendid co-operation which its readers have shown in the work of making up a good farm paper and we are deeply indebted to those subscribers who have contributed good, practical letters. We are proud to record the fact that the very best talent in the state, as well as from adjoining states, has assisted us during the past year. The paper is stronger each year by reason of the good friends it makes and let it be understood that these good friends are appreciated. The policy of The Wisconsin Farmer is to keep continually paying, as far as possible, its debt to its loyal readers and supporters by improving the quality of the articles presented in these columns. The Wisconsin Farmer is not content to overcrowd the paper with advertisements, but we aim to think of the reader first, knowing that the advertiser is smart enough to discover a good paper and place his appeal in its columns.

The Wisconsin Farmer is proud of its advertisers and it is the aim of the publisher to keep the advertising columns just as truthful as the news columns. Many thousands of dollars are refused every year by the publisher of The Wisconsin Farmer, because he will not permit false and misleading advertisements to appear in these columns.

Wisconsin School-teacher Making Good as Farmer.

F. F. SHOWERS, of Walworth county, who taught school until he was twenty-three years of age, is now making good as a farmer. The December bulletin issued by the Wisconsin Bankers' Association, discusses Mr. Showers' farm methods and the things which he believes point to better farming.

In the first place, according to Mr. Showers' view, the farmer cannot expect to suceed and keep "union" hours. He must love and enjoy his work to the extent that most of the time he will forget that he has a hard task before him. Produce, care for, and raise only the very best, no matter what your specialty in farming may be, is the Showers plan. Mr. Showers has a dairy herd which has netted him $72 per year per cow. He is farming only forty acres, but he is farming it all and making every lick count. Some of the pointers which the successful farmer gives out in the bankers' bulletin are as follows:

I study each field so that I know what crop it will produce to best advantage. A farmer can do this on the small farm since it is possible to utilize the smallest possible fields. The farmer on the small farm must utilize all the corners of the farm. The returns from some fields on a small farm will be equal to the wastes upon many large farms.

If my soil is acid, I use lime. If my field is wet or poorly drained, I tile it. A farmer can fertilize the field, plow it, prepare the seed bed as it should be prepared and get the soil in the best condition for plant food and the maintenance of the moisture.

The farmer on a small farm must raise crops which are best adapted for his soil and from which the best returns in milk, pork, beef or whatever you have to market, can be secured. Often the surplus roughage or hay can be sold and feeds bought which will produce more milk or meat than this hay or roughage would have done.

I found that I could grow alfalfa on my farm and get good returns. I made a study of the plant, found that it needed a well-drained soil, and that it required a well-prepared seed bed. I knew that I had a well-drained soil and that it was necessary for me to supply the seed bed. The farmers who drove past, stared at me when I harrowed and harrowed the field I was preparing for alfalfa. I went over the ground eleven times until it was as mellow as a well-worked garden.

Sweet clover was growing three or four feet high along the roadside, so I inoculated my alfalfa field with the soil in which the clover had been growing. The stand did not satisfy me, so that when I planted my second field I fertilized the field before plowing it in the fall, disking and harrowing in the spring.

My first field yielded five tons to the acre, but it did not satisfy me. I bought a lime sower and ground limestone, and inoculated with soil from the old field at the rate of 500 pounds of soil to 2,000 pounds of ground limestone. I sowed twenty pounds of alfalfa and twenty-five pounds of barley to the acre. Because of the thorough preparation of the seed bed, the barley yielded forty bushels to the acre.

Upon this field last year eight tons of alfalfa hay were cut from every acre. My profit was $98.40 an acre, after deducting the interest on the land at $200 an acre, the taxes, the cost of plowing, disking, planting, fertilizing and liming, besides the expense of cutting, tedding, raking, cocking, capping, shaking out and hauling the hay.

In curing alfalfa to get the largest return I cut the hay as soon as the dew is off in the morning and start tedding so that I can cock and cap the hay in the afternoon. About three o'clock the alfalfa is raked into windrows, carefully cocked (not tumbled) and then capped. I leave the hay in the cocks from eight to ten days, depending on the weather. (If necessary to leave the hay in cock for several days the cocks should be moved about so as not to weaken the plants under them.) Then the cocks are opened up, but not scattered out, and the hay placed in layers so that the leaves do not become brittle and rattle off. An hour or two later I begin putting the hay in the mow. It is surprising how the alfalfa retains its color until it is thrown out of the mow the following summer.

I try to run my farm as the best business men run their business. Most business men would not feed their cows hay just because it happened to be on hand if they could sell that hay and buy other feed which would produce more milk. Last year I sold $300 worth of alfalfa and purchased feed valued at $296.95. I did this so I could have a balanced ration, and I know my cows like a change in feed.

I try to make each cow as comfortable as possible. I give her a soft bed, plenty of bedding, curry her and speak to her kindly. I find that these increase the dividend from my milk pails.

I make a difference in the amount of feed I give to a cow weighing 1,000 pounds and one weighing 1,200 pounds. Reason shows me that, although the larger cow may not produce the largest amount of butter fat, more feed is required for her maintenance. This food, of course, will vary from the kind of food fed for butter fat. I think that the secret of success or failure in the dairy business lies in the worth of the individual cow.

I know it is possible and profitable to have one

head of stock on each acre. My silo and alfalfa fields have helped me to unlock the secret of money-making on a small farm.

Our Next Serial.

"HEPSEY BURKE," a sister to David Harum, written by the brother of the man who wrote the original, will be our next serial, publication to begin in these columns in the next two or three weeks. We confidently assert that "Hepsey Burke" is the most interesting serial which any farm paper has ever given to its subscribers, and we look forward to its publication in these columns with the greatest of pleasure.

No book ever won a large audience more quickly, or held its audience more steadily and for a greater length of time, than "David Harum." The author of "David Harum" died before the book was off the press. The present story, "Hepsey Burke," was written by F. N. Wescott, a brother of E. N. Westcott, the author of the original "David Harum." With her homespun philosophy, her kindly digs at folks and things and her unfailing good humor, "Hepsey Burke" is sure to be a success with the readers of The Wisconsin Farmer. If you liked "David Harum" you will love "Hepsey Burke." Be sure to watch for the opening installment and read every word of this interesting serial.

Interest in Automobile Shows.

FARMERS in this state are becoming more and more interested each year in the annual automobile show at Milwaukee. The 1916 show is on this week. It has been one of the best shows ever seen in the country. Wisconsin will have 100,000 automobiles in another year and it is fitting that the season of western auto shows start in Milwaukee. Milwaukee has a number of enterprising and hustling distributors who have helped put Wisconsin on the automobile map of the nation.

The automobile is coming into such general use on the farm that the farmer finds it not only enjoyable but profitable to attend the shows and make a study of the machines and accessories there displayed. There are two other automobile shows in the near future which will be attended by a good many Wisconsin people. The Chicago show will be held in the Coliseum and First Regiment Armory under the auspices of the National Automobile Chamber of Commerce, January 22d-29th. The Minneapols show will be held the week following, the dates being January 25th to February 5th. The show will be held in the National Guard Armory under the auspices of the Minneapolis Automobile Trade Association.

Serum Treatment Effective in Thousands of Cases.

IN 1913 THE federal government began a series of hog cholera control work in three counties to determine the practicability of eradicating hog cholera from selected sections of the country. Incidentally the department had in mind ascertaining the feasibility of enlisting the aid of farmers themselves in efforts to combat this disease. The following year, that is in 1914, the work was extended to seventeen counties in different sections of the country.

At each of these stations the work is conducted by one veterinary inspector in charge and two assistant veterinarians. The methods employed in these counties have varied considerably to suit the conditions that were more or less local in character. In some counties, for example, all of the inoculation work was done with serum alone. In other counties the simultaneous system was used. Where herds were infected, serum alone was used, whereas the hogs which appeared well at the time of treatment were given the simultaneous inoculation.

Secretary Houston's recent report summarizes the results of the experimental work carried on in 1913 and 1914. During this period there were 9,686 hogs treated with serum alone, and of this number thirty-four died. On the other hand, there were 8,010 hogs treated with simultaneous system, and out of this number fourteen died. In all there were 17,696 hogs treated, and forty-eight died, or approximately one-quarter of 1 per cent of the hogs treated. The above results were obtained with hogs that were apparently well when treated but were regarded by the field inspector as having been exposed.

During the same period, that is, during 1913 and 1914, 53,485 sick hogs were treated with serum alone, and out of this number 15,570 died, or 29 per cent. On the other hand, among herds where cholera existed but where well animals were treated, 44,277 hogs were given the simultaneous system, and of this number 1,298 died, or 2.9 per cent. There were 40,662 well hogs from diseased herds treated with serum alone, and of this number 2,077 died, or 5.1 per cent. It would seem from the latter figures that even in the case of exposed hogs the simultaneous system affords a greater production than the serum alone plan. Of the whole number treated in herds where the disease existed, 38 per cent of the hogs were sick when treated and yet the loss out of the whole number was only 13.7 per cent. This would indicate that the serum has a distinct curative action when administered in the early stages of the disease.

Secretary Houston calls attention to the fact that extensive observations and comparisons of treated and untreated sows in Dallas county, Iowa, during a two-year period led to the conclusion that the simultaneous method, when properly applied, does not produce sterility in sows. Out of 1,746 sows in 126 herds treated by the simultaneous system ninety-eight, or 5.62 per cent, proved sterile, while seventy-four untreated sows out of 1,103 in eighty-seven herds were sterile. In the latter case 6 per cent of the untreated sows were sterile, which is a slightly larger percentage than in the case of the treated sows.

It has been found that hog cholera was spread from farm to farm in 23 per cent of the cases by exchanging labor and by visiting infected premises. In eight cases out of 100 exposure of sick hogs on adjoining farms spread the disease. Dogs were responsible for carrying it in nine cases out of each 100. It was traced to birds in seventeen cases. Other means of spreading the disease were by infected cars, the purchasing of new stock, and contaminated streams. The conclusion has been reached as the result of a great deal of experimental work that the serum alone treatment produces an immunity which lasts from three weeks to three months, while the simultaneous system produces immunity which, in most cases, seems to last during the lifetime of the animal.

Silage Alone as Roughage For Breeding Herd.

AN INTERESTING line of investigational work in handling beef cattle is being carried on at the Pennsylvania station, the prime object of which is to ascertain the cost of feeding a beef herd for a year. The latest experiment was undertaken with ten Short-horn and ten Aberdeen Angus cows. In cold weather these cows were allowed to run in the basement of a barn open on the south. During the winter months these cows were fed all the ensilage that they would eat twice daily. This was determined by the amount that would be consumed within one hour after feeding them. In addition, cottonseed meal was fed at the rate of one pound daily per cow.

The results of a six months' winter feeding period are most interesting, because they show that the animals in each group actually gained in weight. For example, the Short-horn cows weighed 1,179 pounds at the beginning of winter and 1,230 at the end, whereas the Angus cows weighed 1,142 pounds in the begining and 1,189 at the end. In the one case there was a gain of fifty-one pounds made per head, and in the other forty-six pounds. During the six months' period the Short-horn cows consumed an average of fifty-nine pounds of ensilage daily, whereas the Angus cows consumed fifty-eight pounds. The amount of cottonseed meal was the same in each case, namely, one pound per cow daily. Computing the value of ensilage at $3.50 per ton, the roughage alone during the six months' period cost, in the case of the Short-horns, $15.96, and in the case of the Angus $15.73. The value of the cottonseed meal consumed during the winter period was $2.32 in each case. Charging up the value of the bedding at $8 per ton and the labor at $2.34, and crediting the cows with manure valued at $7.33, it was found that the net cost of wintering a cow during a six months' period was $19.14 in the case of the Short-horns and $18.91 in the case of the Angus. The difference is so slight that the cost may be regarded as practically the same in each case. These cattle wintered on ensilage and a small amount of cottonseed meal relished their feed at all times, and at no time did they show any tendency to lack an appetite for it.

The Short-horn calves from these cows weighed at one year of age 669 pounds, while the Angus calves weighed 585 pounds. The Short-horn calves during the first year made an average daily gain of 1.68 pounds and the Angus calves 1.40 pounds. Fifty per cent of the Short-horn cows raised calves and 79 per cent of the Angus cows. There was some abortion in the herd, and this, no doubt, in part, accounts for the relatively small number of calves raised from each group of cows. An account was kept of the cost of grazing the cows during the remaining six months of the year, and this amounted to $7.22 per cow in the case of the Short-horns and $7.50 for the Angus. Adding to the feed items the cost of the service of sire and the interest on the value of the cows, it was found that it cost $33.76 to care for a Short-horn cow for a year and $33.81 for an Angus cow. That two acres was sufficient pasture for one cow. The land upon which these cows pastured was valued at $56 per acre, so that corn-belt farmers, in computing interest on investment, will have to make allowance for a larger land valuation.

It becomes apparent at once that even with this inexpensive winter ration and low-priced pasture land that the breeder would have to succeed in raising a larger percentage of calves than resulted in the case of the Short-horns if he succeeded in producing baby beef at a profit, because there would be in this instance taxed up to each calf at one year old an approximate cost for the keep of two dams of $67. This would be reduced to half this amount if ten calves could be raised from the ten cows.

High-Type Citizenship Follows Stock Raising.

[This is the fourth of a series of articles on "Opportunities for Live Stock in Wisconsin," which is being prepared for The Wisconsin Farmer by Stephen A. Baird, president of the Wisconsin Live Stock Breeders' Association.]

LIVE stock farming means the raising of profitable animals—animals which pay for their keep and return a profit. Profit-producing animals mean pure-bred, carefully selected sires, mated with females of a particular type for a particular purpose. Intelligent feeding, proper care and good management are essentials that must have attention, else selection and breeding do not count.

Such problems are difficult ones. They challenge a man's best talent and skill. They make him wide awake, progressive and resourceful. The many business details connected with the industry require a wide knowledge and experience and develop executive ability that makes leaders. Why shouldn't stockmen lead?

How many successful stockmen did you ever see who groomed the cows with a milk stool or coaxed the steers to the feeding rack with a "black snake" or kicked the lambs out of the way. A real stockman's voice, manners and actions are kind and gentle. His love of animal life keeps him with his stock, often when he knows that there is nothing lacking to make them comfortable. His animals feel his gentleness and kindness and respond to it. He spreads it in his home and among his neighbors and finds it responded to there.

Go into any community where live stock has reached a high state of development and what do you find? Has not citizenship kept pace? Is not the community orderly and well governed? Who are the community leaders? The most modern and best governed states are live stock states.

The steady decrease of farm population has been viewed with much alarm. Just how far the social disadvantages of country life affect the problem it is hard to say, but it is certain that in stock raising communities there is less movement from the farms to the towns and cities. Farm animals have an attraction for most boys and girls, and the social life in the stock raising community seems to be stronger knit. Only last summer the Wisconsin Live Stock Breeders' Associaton provided speakers for about fifty summer picnics of community breeders in every part of the state, and there were probably twice as many more held.

The stock breeder's calling is a manly, splendid and ennobling one. The man who engages in it along the lines he must follow in order to make a success of his undertaking is helping the Creator's great work; he is playing well his part; he is feeding his brethren; he is improving the health and strength of his fellowmen, adding to the manliness of man and increasing the wealth and prosperity of the world.

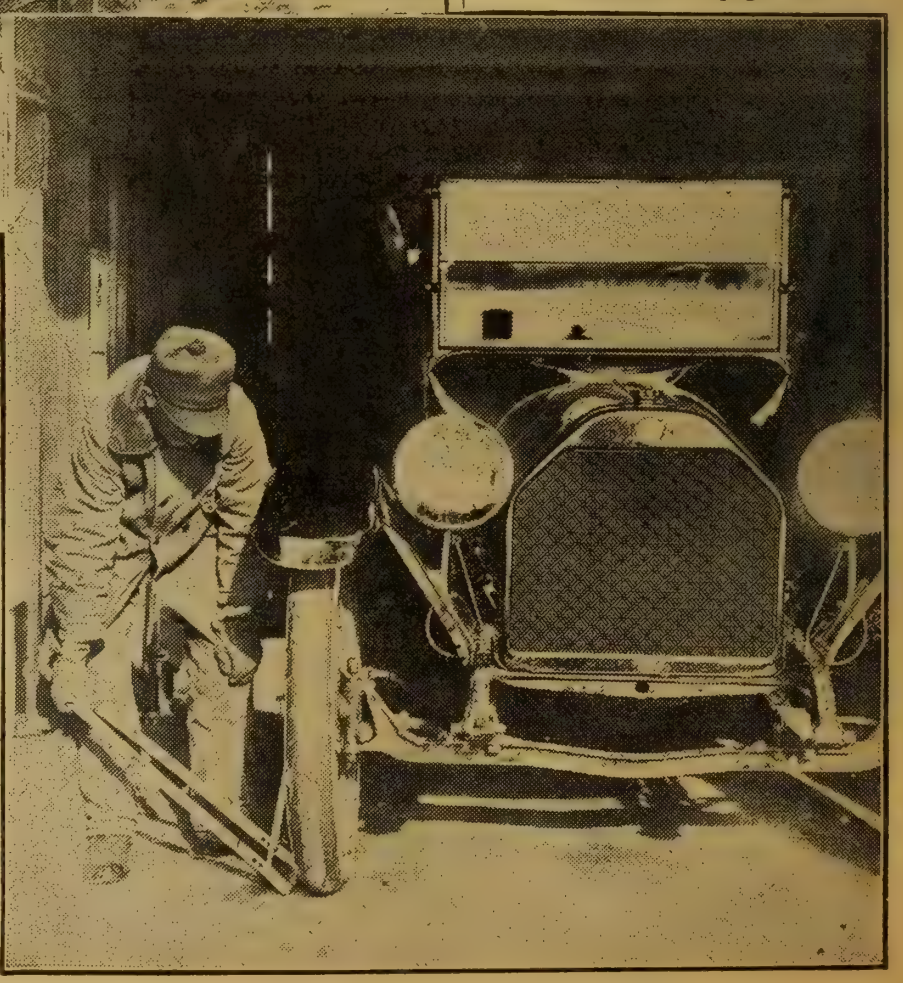
Exporting Pure-Bred Drafters.

SIXTEEN months of conflict between nations on the continent has resulted in making vast changes in agricultural and industrial conditions. Regardless of the fact that motor trucks and automobiles have been extensively used as an aid to the butchering process that continues unabated, the horse's part in warfare is still an important one. Approximately 5,000,000 head of horses have been used by the warring nations up to the present time, and some authorities have predicted that in the end it will be the number of horses available that will determine which is the winning side.

America has been drawn upon heavily, and already close to half a million American horses have been put under fire. In the main, this draft has been made upon a class of horses that we can spare, and we could even part with more without crippling our agricultural or industrial conditions. Not only have nondescript horses of foreign nations been used extensively, but the pure-bred drafters have been commandeered by the thousands, with the result that some of their breeds of draft horses are being so thinned out that the help of American breeders has already been sought.

In a cablegram to the secretary of the Percheron Society of America, President Aveline, of the Percheron Society of France, announces that the importation of 200 stallions foaled in 1912 or earlier has been recommended by the authorities. Thus we find that within a period of sixteen months we have changed from an importing to an exporting nation. Whether this order will be filled or not remains to be seen, but the receipt of this cablegram is a compliment to American draft horse breeders. They have been bringing the good ones from France for a generation, and while most of the stallions have been used in what might be called "work horse" breeding, we have nevertheless a fine nucleus of pure-bred Percherons, and from this the demand will be supplied regardless of where it comes from.

THE MOTOR CAR IN WINTER.



TIME was when the motor car was considered only in warm weather. If any advice was given at all during the winter season it ran something like this: "Take the tires from the rims and wrap them well to exclude moisture and light; paint the rims and cover the car itself completely with a good canvas cover." The man who owns a car exclusively for pleasure driving may treat his car that way, with the coming of winter, but the farmer does not. The car of the farmer is bought for use, for business as well as for pleasure, and it is not laid away for winter, as if it were a frail, delicate thing, unable to stand the snows and freezes of a winter season.

This makes the seventh winter of car driving for me, and each one has been looked upon with less timidity in so far as the use of the car is concerned. Of course, there are times when car driving is out of the question, because of deep-mud roads or when a freeze-up with the roads in a very rough condition means taking more out of the car than the trip in question is worth, but aside from these impossibilities, you'll be surprised, in counting up the days of winter, to find how few there have been when the car could not have been used. There are a few cares and precautions, especially applicable to the use of the car in winter, that experience has taught me. Perhaps the car-owning readers of this paper will be interested in a brief account of what a brother farmer has "run up against" during the six past winters of car using, always on country roads and under average farm conditions.

First of all, there is the freezing proposition to be taken into consideration. Let me advise you to by all means make and use an anti-freezing solution for use in your radiator. I worried along with plain water for several winters, and while I never did forget to drain the radiator and never had a serious mishap by the water freezing, the thought that it might freeze continually haunted me, and now, with a cheaply and easily made anti-freezing solution, I forget this care and cease to worry. Denatured alcohol and water is all that's needed to make it, although some add glycerin. The object of the latter is to retard evaporation of the alcohol, but it is harmful to the hose connections, and I would rather add alcohol from time to time than to keep renewing hose connections. This winter, for a dollar, I bought and am using what is known as a "freeze-ometer," which is a contrivance on the hydrometer order, and with it you can make a test of your anti-freeze solution at any time you wish and by its reading you can tell at exactly what temperature the mixture will freeze. As alcohol evaporates much quicker than water, it is a dollar well spent for one of these little contrivances, for by its use you are safe and know when to add more alcohol and what amount to suit the temperature. However, if you have no tester, you can make a solution of 40 per cent alcohol and 60 per cent water and know that it will not freeze until it is 20 below zero. As you run your car and heat this mixture, though, some of the alcohol will evaporate, and when you add to the contents of the radiator add more alcohol than you do water. A good plan is to draw some of the mixture from the radiator into a bottle and set this beside the car. You can thus tell by watching this when there is a tendency to freeze because of the mixture becoming weak in alcohol.

A roll-up hood for the front of the radiator is a good thing for the winter. It permits warming up the engine sooner on the road and keeping it warm. It may be rolled up or down to admit more or less air, as the need may be. Such a hood may be bought ready made or can be made from a good grade of black oil cloth, lined with any thick, soft cloth. By keeping your engine warmer you get more power from your gasoline, so a radiator hood will soon pay for itself in gasoline saved.

Cuts and bruises on the tires are more common when the roads are rough and frozen, yet a good tire, well inflated, will stand more bad road abuse than seems possible. I have long since learned there is little to be saved by a too judicious care of the tires so far as not using them is concerned, as a tire will rot out by standing in about such a time, and the average farmer usually does not more than make the guaranteed mileage in this length of time. Of course, I do not mean to run fast over rocks and frozen, icy roads, on the theory that the tires will rot out before use wears them out, but I do mean that one can be so careful of them that the use one should have from them is not received, simply because the rubber and fabric rots in storage in such a time, anyhow. I find a set of storage or "tire saving" jacks a good investment. There are many kinds of these on the market, or you can make them yourself out of good hardwood and scrap iron, but to be of good service they should be quickly operated or you will get out of the habit of using them except when the car will stand for some length of time. The weight of the car on an idle tire is a great and constant strain on the fabric. Relieved of the weight and bearing only the required pressure of air, a tire loses little in idleness compared with what it loses when bearing air pressure and weight of the car combined. A friend who has kept book account both ways tells me he has received 35 per cent more mileage from a set of tires that were relieved of the weight of the car except when in use than from a set of the same style and make that carried the weight of the car in idleness as well as in use. You can buy a set of all steel storage jacks, one for each wheel, that are easily and quickly operated, for less than $3 for all four. Certainly you can find no "accessory" that is more worth the price or that will more quickly "make back" its cost than this.

A small vulcanizer is a great expense saver for the farmer-car owner. You can soon learn the use of one, then can fix your own tubes, thus each puncture or blow-out does not mean 50 or 75 cents to the repair man to fix tube alone. Casing repairs can be made in a limited way with a small vulcanizer, and I have long since found that larger repairs, such as are beyond the scope of the small vulcanizer is usually throwing money away. Better use a good blow-out patch inside the casing when a blow-out occurs and apply the price of a vulcanized section on the cost of a new tire, for new sections vulcanized in old tires invariably fail to give the service their cost should justify. A small vulcanizer, costing from $2.50 to $8, will soon pay for itself in tube repairs, and with two or three extra tubes, you can manage to do the work on rainy days. A vulcanized patch on a tube will stay, but a cemented patch burns off sooner or later, and needless to say it always does it just when you would rather it would not. Keep a small supply of raw or vulcanizing rubber on hand, and when a casing

(Concluded on page 19.)

Lower Illustration—You can buy a set of all steel storage jacks for less than $3.

Every Wisconsin Farmer Should Read This Announcement

For it tells of a Great Land Opening that will enable a farmer at a glance to make up his mind whether or not this is an opportunity for him to build a Better Home—Earn a Better Living and Lead a Better Life than he is now doing.

When the United States Government throws open its lands for settlement, the people recognize the great opportunity; and filing applications often outnumber possible claims at the ratio of 100 to 1. There is a reason for this, and this reason is: "The American farmer knows the value of a new country and new land." This announcement is very similar to a Government enterprise in this respect.

Suppose you could transplant your farm, with the very surroundings amid which you have lived for so many years, to a newer climate where your acreage might produce for you three crops per year. Wouldn't you gladly embrace the opportunity? The land we want to tell you about is located in Beauregard Parish (County), Southwestern Louisiana. These lands lie high, are naturally well drained and are virgin in every sense of the word. No plow has ever pierced the breast of the acres we will soon throw open for settlement. No farmer has ever taken from this soil any of its pristine value. Beauregard Parish (County), around that great center known as the De Ridder, Ludington and Bonami District, enjoys all the sterling qualities of the famous state of Louisiana, without suffering from the drawbacks which have obtained in the past in other regions of this noble state. Beauregard Parish lies in the very heart of what is know as the Ozone Belt of Louisiana's famous highlands. Singularly free is this region from rigorous climate and the effects of stagnant water. There is no river overflow, nor backwater to create swamps. To the ordinary farmer of the state, except for new delightful foliage of trees, plants, etc., the contour of this section would remind him of his own land.

Corn has become Louisiana's staple product, in point of acreage devoted to it, quality produced and value. From a yield of 19,516,500 bushels in 1913, it has increased to more than 48,000,000 bushels in the year just passed. There is a reason for this enormous development—and that reason is the influx of Northern farmers into this wonderful state.

It is said that Louisiana has more miles of navigable streams than any other state in the Union. Its lands consist of 29,610,000 acres, which were once gigantic forests. Louisiana has been slower in developing, than those farm regions, where lumber was not necessary to remove, in order that such lands might be cultivated. The fame of Louisiana, the building of railroads through the heart of the forests, the ever increasing demand for its excellent lumber, has, year after year, thrown open for settlement great quantities of virgin farm land; and each year finds the total of taxation in the state sufficient to enable the great parishes—which are the same as Northern counties—to extend the work of improvement into all lines, such as roads, schools, extension work, etc. If you could go to De Ridder today, with some of **your** school commissioners, and see there what Beauregard Parish is doing in the matter of school work, you would surprise and even shame your own county in this regard.

The United States Government has established an Agricultural Field Agent in this section at De Ridder; the Parish (County) Commissioners and Principals of schools are extending the work of agriculture to the school room. The children are gathered together from great distances by County conveyances, and thus carried to school. No condition of time, distance nor climate stands in the way of education in this great region.

THESE LANDS

Let us tell you briefly something of the lands, about which we want to focus your attention in this announcement. The timber from these lands has been removed by Long-Bell Lumber Company operations. Most of this timber has been cut off for a period of five years. It is a well-known fact that, when land is exposed that has been tree-covered, and the trees taken from the soil, such land passes through a reconstruction period. It becomes sick, so to speak, and the chemical forces within it set to work to build up a newer, better soil. Gradually it turns itself over and over. It takes time to do this, and the great difficulty has been, with land of this character, that agriculture follows too closely behind the woodman's ax. In this region however, sufficient time has passed to prepare the soil for the plow. Here, to this very spot, great transportation companies have been attracted by the traffic of lumber. Three great railroads traverse this fertile Parish **now**, while lumber railroads form a network of lines between them. To the South, sixty-five miles "as the crow flies," lies the great Gulf of Mexico. Its winds temper the atmosphere to a point one hundred miles inland. At night this cooling Gulf wind enables one to sleep during the hottest part of the summer with comfort, and the same wind that acts as a shield in the summer throws a protecting blanket over this region during the fall and winter months. It is a sort of an air cushion that stands the buffeting of the air currents hurled upon it from the North, East and West.

LARGE CAPITAL AND FARMS

There is approximately from twelve to sixteen years' more work for the lumber mills in Louisiana. The railroads have followed the saw mill and logging camps. Great capital is soon to be shorn of its earning power derived from the products of the forest. Capital has realized this fact; the United States Government has realized it; the State of Louisiana has realized it. We then find that all the large influences and financial interests have really awakened to the necessity of placing crops where once stood the forest tree.

MIXED FARMING AND READY MONEY

The charm of this section lies in a great degree with the fact that the Northern farmer can grow corn, oats, hay, the clovers, velvet beans, cowpeas and other legumes, and with less competition, than in almost any section of the North. There is need for the dairy cow; there is need for market cattle; there is a crying need for pork and sheep; and, while all these necessities await only the **Man-quality** to bring them into profitable being, there is the climate which makes possible the planting around a man's home of a few of the semi-tropical staples as by-products to his farm. Such crops are oranges, kumquats, figs, grapes, pecans, vegetables, melons, ground fruits, etc., which will swell his opportunity to make a small acreage, with ordinary effort, yield tremendously.

This Company is a sister corporation to the Long-Bell Lumber Company, which concern needs no introduction to the American people, as it has no superior in the lumber business of our land. Any financial institution—no matter where you are located—has the means at hand to determine the value of the Long-Bell Lumber Company's name. The same excellence which obtains with this company will be the steadfast rule of the Long-Bell Farm Land Corporation, whose lands we are now describing. This being an assured fact, that which is to follow should be of particular appeal to everyone.

OUR PLAN

It is our purpose to throw open for settlement 100,000 acres during the year 1916; 100,000 acres during the year 1917; to be followed by an additional 100,000 acres in 1918. The first block of land, 100,000 acres, will be offered under our plan of settlement in about thirty days. We are today making this announcement in many sections of this country to the American farmer. We have so timed this publicity that the public will have identical opportunity for investigation at the same hour. In other words, the man who lives in the State of Washington will have the same opportunity, under our unique plan of selling, as the man in Ohio, Indiana, Illinois and Iowa. We have a UNIQUE plan, but because of the very facts stated above, we cannot unfold this plan in this publication, at this early date. All that we can do is to call your attention to our announcement in full, which will appear in the columns of this paper on the 27th day of January, 1916. It is our purpose to sell these lands in blocks of 40, 80, 120 and 160 acres. We will sell no land to any man unless we are assured that such an individual has the means to improve his land, and to cover his expenses for such a period until the farm can return to him a profit necessary to the work of making virgin acres—a producing farm. We want no idlers, nor people fascinated with false dreams. **We want men and women who are as good as the soil and climate.** No matter how rich the land, science always finds that a certain proportion of mankind fails under any and all conditions. A great worker of this country, connected with the United States Agricultural Department, said of the Southern land: "Seventy-five per cent of the value of the South is climate; fifteen per cent soil, and ten per cent man; but if you do not give the soil and the climate the ten per cent man-quality, the South cannot take advantage of the remaining ninety per cent of its producing value."

We want to free this announcement of any glamour or imaginings that will paint landscapes in the brain of the cool and collected man; and thus sway his judgment against his real duties to himself, his family and his future. On the other hand, we do not want stable, competent, equipped Northern farmers to confuse this project with some kind of colonization work that has been carried on in the South in the past—to a failure.

This Company reserves the right to know as much about its colonists as its colonists desire to know about it. This may sound like high-handedness, but we know the effect of "one bad apple in the barrel." We know that one failure among twenty or thirty strictly energetic settlers breeds discontent, and we do not intend to let a man, who is not equipped for success, run headlong upon the rocks of his own ignorance.

This land will be sold at a remarkable figure, and upon very interesting terms. When you read the announcement of our plan you will be convinced that the Company has struck the very keynote to the needs of land development. The first requirement will be that the settler is allowed as much use of his money as is possible. Land payments will not be allowed to exhaust development funds. He will receive from the Company all the co-operation that may be expected, to bring about the successful tilling of his acres. The Company has a demonstration farm where the question of soil has already been proven, and where the Company's expert is equipped to illustrate his words by growing tests made over a period of eight years. **You can see his success with your own eyes.** Every need of the very acres and the very soil upon which a settler will locate has been solved already by this Company. Having accomplished these things to our own satisfaction, we are prepared to place the right kind of men and women on the land, at terms that will permit them to pay for the land out of its earnings. Possession will be granted at once after first payment. By reading our great announcement in this paper on the 27th day of January, 1916, you will learn exactly what these terms are, and no word of ours will be necessary to show you the value of your opportunity. You can see it at a glance.

You must rest assured that everything stated in this announcement is stated by a commercial enterprise whose influence, in the business world, is so well established that your own banker will prove to be as large a testimonial as anyone would care to offer. To the curiosity seeker, the skeptic, the pessimist or the idler, we have nothing to offer. To the man who knows farm conditions, whose judgment has led him to success in the past, and to hope of continuous success in the future, we **do** want to appeal—and we want to appeal as strongly as we may. This land will all be sold, and sold to the right kind of people; and these people will be successful. If you are one of such, then we want to call your attention particularly to the issue of this publication which will appear on the 27th day of January, 1916. We want you to read this issue and to act on it at once. It will have an offer that will be very attractive to everyone, provided he is alive to opportunity and takes time by the forelock. If, for any reason, you believe you will not see this issue, then by all means clip the coupon below and send to us **NOW.** We will place your name on our mailing list and send our literature to you. In this literature you will receive not only the same facts contained in our announcement, but you will obtain photographs and reproductions of the very sights you will view when you go down to visit the lands of this Company. We will keep your name and send this literature to you so that it will arrive, wherever you desire it to arrive, at approximately the same time as our announcement in this publication. In this way we will give you an equal advantage with the thousands of persons who will anxiously await the data pertaining to this New Land Opening in Louisiana.

CURRENT EVENTS

THE embargo on public discussion of international relations of the United States, incident to the European war was lifted in the senate last week and President Wilson's foreign policy was condemned and commended in a half dozen ringing and vitriolic speeches which undoubtedly mark the beginning of the political campaign for the presidential succession. Party lines were not strictly drawn, however. Senator Jones, of Washington, republican, denounced as "unpatriotic," American citizens who imperiled the nation by taking passage on belligerent vessels. Senator Works, of California, republican, asserted that the government of the United States was "hypocritically" claiming to be neutral when it was in fact participating in the war through the sale of munitions. Senator Lodge, of Massachusetts, ranking republican member of the foreign relations committee, declared that to place an embargo on arms now would be worth more to Germany than a million men, that it would be a "grossly unneutral act," and would, in fact, make the United States the ally of Germany. Senators O'Gorman, of New York, and Hitchcock, of Nebraska, both democrats, urged the advisability of an embargo on munitions. For the last fifteen months congress and the public generally have heeded President Wilson's request that absolute neutrality be preserved, even in private talk. With this outbreak on the part of congress it is a foregone conclusion that sides will be taken by the public generally, with what effect on international complications remains to be seen.

RELATIONS with Austria, as a result of the sinking of two ocean liners in the last month, are becoming more strained every day. No sooner had Austria made proper apology and promised ample reparation for the sinking of the Italian liner, Ancona, than word came from the Mediterranean sea that the British liner, Persia, had been sunk with considerable loss of life. Only two American passengers were aboard the Persia, but one of them, Robert N. McNeely, recently appointed consul to Aden, Arabia, is among the missing. President Wilson and Secretary Lansing immediately ordered the United States ambassador at Vienna to make full investigation, pending which official action is being withheld. Should it develop, however, that an Austrian submarine sank the Persia without notification or giving the passengers ample time to be taken off in safety, there can hardly help but be a break between the two countries. It will be recalled that the United States gave the Austrian minister, Dr. Dumba, his passports because of his pernicious participation in labor matters in this country, endeavoring to cause strikes in munition factories. The sinking of the two vessels complicates the misunderstanding due to Dr. Dumba's actions, so that affairs between the United States and Austria are more critical today than they ever were between the United States and Germany, which have now been happily settled.

JOSEPH R. LAMAR, associate justice of the United States supreme court, died during the past week, at the age of fifty-eight years. He had been on the supreme bench five years, having been appointed by President Taft as one of the democratic members of that high tribunal. Justice Lamar was buried at his former home in Augusta, Georgia. His death will make a vacancy in the supreme court which President Wilson will fill without delay because of the large number of important cases pending on the docket. It is expected that a southern democrat will be named for the position. Fred W. Lehmann, of St. Louis, is prominently mentioned in this connection. He served with Justice Lamar as one of the American commissioners to the Niagara Falls mediation conference. Mr. Lehmann has frequently been mentioned for this high office and his appointment would give the grain belt the representation on the supreme bench which is now lacking.

GEN. GRENVILLE M. DODGE, the last of the army commanders of the North in the civil war, died at his home in Council Bluffs last week, at the age of eighty-four years. General Dodge was buried with high military honors befitting one of his rank. When Gen. Daniel E. Sickles died a year ago Major General Dodge was left as the only surviving army-corps commander who commanded during active service. His fame did not rest, however, on his military achievements alone, for he was equally conspicuous as a railroad builder. The Union Pacific was built by him under great difficulties, the rails being literally forced through a country held by hostile Indians, with many difficulties to overcome. General Dodge built many other railroads, among them the following: Texas & Pacific; Missouri, Kansas & Texas; International & Great Northern; New Orleans & Pacific; Des Moines, Northern & Western; Oriental & Mexican Southern (partially); Fort Worth & Denver; Denver, Texas & Fort Worth, and several other lines in which he was more or less interested. From 1874 to 1879 he spent a portion of each year abroad, and was consulted by the builders of the great Russian transcontinental line from St. Petersburg through Siberia to the Pacific ocean, and on other foreign enterprises. He was asked to take charge of a system of internal improvements in China, but the project failed at first on account of the death of Anson Burlingame, former United States minister to China, who had it in charge, and when the Chinese government again asked him to go to China for this purpose, in 1886, he was unable to go. He was one of the most notable figures of the grain belt.

HENRY FORD returned to the United States last week. His ideas of war have undergone a material change. Mr. Ford no longer believes that the bitter struggle in Europe is being continued by the political intrigues and personal ambitions of the monarchs, but by the criminal indifference of the people themselves. When Mr. Ford left on his peace ship a few weeks ago he was of the opinion that bankers and manufacturers of munitions were responsible for the continuation of the war. Since his return, however, he frankly admits that the men doing the fighting have been too content to let those who lead them do their thinking and have not taken advantage of their divine right to say themselves what they shall do and think. "Republics are no better than monarchies in this respect," he says now. "Even in the United States we let those whom we have elected to office be swerved from their duty. We do not assert ourselves. Personally, I have been a voter thirty-one years and in all that time I have voted only six times and then because my wife made me." Of the eventual success of the peace mission, Mr. Ford declares he has no doubt. "The movement is now organized and under way," he says. "People are talking about it, and while some criticise, when people talk they think and when they think they think right." Mr. Ford's peace party visited The Hague last week, after which it officially disbanded, the majority of the members being now on their way back to this country. While there are few, if any, tangible results of the expedition, Mr. Ford is satisfied, having aroused public opinion, that being a considerable feat in itself.

PROSPERITY throughout the entire country on a scale not experienced for a decade is indicated for 1916 from the reports to the National Chamber of Commerce from every section of the country and from practically every industry and field of labor and commerce. These reports gathered upon a nonpolitical basis, show a striking contrast from the conditions prevailing at this time a year ago. "There are localities where much caution and conservatism yet remain," says the general report on business conditions over the nation. "But broadly speaking, it may be said the spirit of optimism and hopefulness prevails to a degree that has not been apparent for nearly a decade and the general belief and expectation is for such prosperity during 1916 as will recompense the people of this country for all their past misfortunes. The crop yields in general, other than cotton, exceed those of any year known in our history. This is true especially of the small grains, as a whole, and particularly of all of the forage crops that are in abundance beyond precedent. This latter fact is one that is most significant and of very large moment to the country as a whole. It is of the utmost value and importance to the farmer to have cheap and abundant feed for his live stock through the coming winter, and this state of affairs at present exists as one of the stable foundations for that commercial prosperity which seems definitely to have arrived."

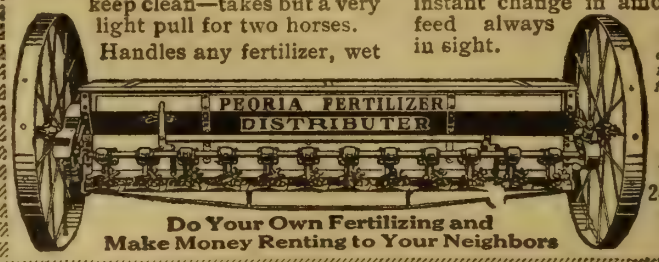
The New Peoria Fertilizer Sower

—the Only Machine That Will Sow Damp Lime and Other Damp Fertilizer

Being able to sow damp fertilizer is one of the most important points that you can look for in a fertilizer sower. It's the point we experimented on for two years to give you in the New Peoria. We produced it in the shaker bar and sight force feed, which keeps the material moving.

Absolutely Prevents Caking or Clogging

The mecnanism is simple—easy to get at without tools—easy to keep clean—takes but a very light pull for two horses. Handles any fertilizer, wet or dry. Covers a strip half a rod wide—holds 7¾ bushels—allows instant change in amount sown; feed always in sight.



Works where all others have failed. Write for circular.

THE FARMER'S OPEN FORUM

POTATO GROWING BY A WISCONSIN CORPORATION.

To the Editor:—It is a very short time since Wisconsin just grew spuds, and thought that spuds were only spuds—that was about all there was to it. One thing the farmers did experience in that line of farming was that their potatoes would "run out," as they put it, every once in a while, providing they did not change seed. And that was true. The writer knows of some cases where they would hardly get the seed. Where the land was in fair condition they would get about 80 per cent of small tubers. The major part of those conditions were due to a lack of good seed. Even though they started with good seed, in a few years their crop would start to decrease in both quality and quantity. They did not know there was anything like breeding to a standard in the potato, such as to type, uniformity of size and color. Those are three functions which we must breed to if we are to keep the potato up to its standard. We hope that about all who are growing potatoes, either for their own use or for the market, are out of that old rut and understand that by breeding up to standard their potatoes will keep from running out.

Speaking from actual experience, the potato is one of Wisconsin's best-paying crops, providing we give it the care necessary. It does not need more care than corn, but I would like this understood—that a whole lot more corn could be raised per acre if it received better care than it does in most cases. The same applies to the potato. First, we must have good seed. Second, we must have the seed-bed in good shape. Third, we must keep weeds out of field. Fourth, we must keep a dust mulch, so the moisture can not pass away so freely.

Now, before I go any further, I will introduce this corporation, their start and success with potato growing. This corporation has its officers and general manager. Five stockholders own the entire stock. Each member has his department to take care of and is responsible for it. I wish to make this part clear. Some may think that we are raising only one crop—the potato—that is not true. Beside the potato we grow corn, clover and cows. We bought the farm from our parents. As they were getting well along in years we thought it would be a good plan to buy the place, and the parents were satisfied with the offer we gave them, so we bought the place. They had farmed the place for thirty years and grew potatoes every year with good success. Even though father and mother are not financially interested in the farm they still take a great deal of interest in our operations.

When we started, dad told us that he always found the Rural New Yorker to be best adapted to our soil and climate, so we decided to give this variety a trial, which we are still growing. Then we knew to get good results we must plant good seed. We bought seed from a reliable grower so as to be sure we had good seed to start with. We practiced hill selection every year. One day last season when our men were digging potatoes dad came to the field, looked up and down the rows, shook his head—"Boys," he said, "never in the thirty years have we had such a crop as that is, even on new land." This made the hired men smile, just to think that conditions in Wisconsin were really improving instead of degenerating. We attribute the largest part of our success to good seed selection and good care, which covers the four principles of potato raising stated above.

We so often hear this remark made by potato growers, "What is the use to grow better potatoes? I get just as much as the fellow that does grow better potatoes." They do not think that by growing better potatoes they increase both the quality and quantity of their crop. If a buyer can get one carload, or any amount so long as it is not less than one carload, of good stock, he will be willing to pay from 5 to 10 cents per bushel more for them than for ordinary stock.

We, as potato growers, owe a whole lot of thanks to Prof. J. G. Milward, secretary of the Wisconsin Potato Growers' Association, and also Prof. F. J. Hicks, president of this association, for all the good work they have done for us, and in fact all the potato interests of the United States. Their greatest wish is to get a large membership so they can get their good work and help as many potato growers as possible.

C. J. Huser,
Sec. Union Grove Dairy Farm Asso.

PROTEST AGAINST REMITTING TAXES.

To the Editor:—A reply to Pres. R. H. Posten, of the St. Croix Valley Association, as regards taxation of pure-bred bulls and stallions. Mr. Posten must be the owner of some pure-bred bulls or stallions or possibly both, to be so enthusiastic about having them exempt from taxation.

A law compelling farmers, handicapped by mortgages, to buy expensive pure-bred bulls or pay high prices for sire service to pure breeders seems to me to be out of all reason.

The time is coming, if it is not already here, that breeders of registered stock cannot find a market for either bulls or heifers and will now try to make a market through the state legislature to dispose of their surplus stock. The poor farmer is to be the goat.

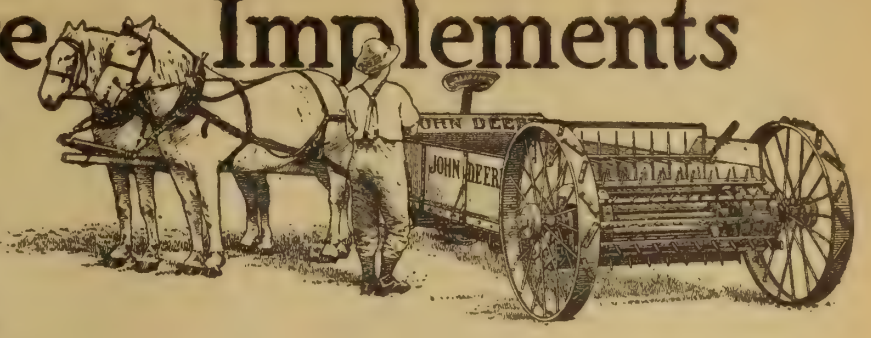
According to my views, a breeder of registered stock is not looking after the welfare of any community or of the state, but is simply looking for the money. It is always the rich man that dodges taxes and this seems to be another case of tax-dodging.

I am in favor of farmers having the best possible stock of any denomination they choose, but I firmly believe it is not right to compel any farmer to buy or go into debt for any pure-bred sire of any kind. If such a law is passed as Mr. R. H. Posten and other pure breeders advocate you will see the farmers' finish. It will make a golden opportunity for land grabbers.

Peter M. Kaad.
Columbia Co., Wisconsin.

How many of the trees and shrubs in your own neighborhood do you know? This is a good time to study them.

John Deere Implements



John Deere Spreader
The Spreader with the Beater on the Axle

ONLY hip high to the top, but has big drive wheels. Wheels out of the way when loading.

Beater drive works on the principle of a horse power. No clutches, no chains, no trouble. Mounting the beater on the axle (a patented feature) does away with half the types of castings.

Three exclusive features of the John Deere Spreader: [1] Beater on the axle—simply revolutionary in spreader building. Nothing else like it. Doubles the value of the spreader by all practical tests. Makes the John Deere Spreader possible. [1]

[2] Revolving Rake—entirely new and original. Load moving back to beater revolves the rake. The teeth down in the load hold the manure while the beater pulverizes it. Draft actually less. Even spread—no bunching. [2

[3] Ball Bearing Eccentric—apron driven without friction. This ball bearing apron drive requires no attention, not even oiling, but it performs wonders in the working of the Spreader. [3]

Write for John Deere Spreader booklet. Tells all about farm manures and fertilizers, how to store manure, its value, and how to spread it most economically. Also contains illustration in colors.

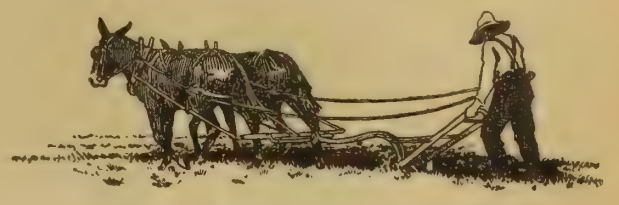
John Deere Corn Planter
The Accurate "Natural Drop" Planter

ACCURATE—because it has the "Natural Selection" drop.

Kernels don't have to be tipped on edge to enter cells. Surface of hopper bottom and openings to seed cells are oblique, or sloping. The kernels naturally move toward and fill the cells.

A full variable drop. Merely shift foot lever to plant two, three or four kernels per hill. Drilling distances varied and change from hilling to drilling or back to hilling made just as easily.

Write for free booklet, "More and Better Corn."



John Deere Syracuse Plows
The Plows with Perfect Fitting Parts

SYRACUSE chilled shares fit perfectly—the extra shares go on easily. A smooth joint is formed between share and moldboard and share draws up snugly to its place. Two bolts in share instead of one. Rib on back of share strengthens share and standard.

Write for free literature on the 442 series, combination plows, for use in sandy or gravelly soils, and work well in turf or stubble. Also the 61 series of combination plows, for use in sandy-loam soils, fairly free from stones and grit, or in sticky soils where good cleaning qualities are desired.

Van Brunt Drills and Seeders
With Adjustable Gate Force Feed

VAN Brunt Drills plant any small seed, alfalfa to bearded oats, peas or beans.

Amount sown per acre easily regulated merely by shifting feed gauge levers.

All the ground sown, because the Van Brunt adjustable gate force feed compels seed to leave hopper in even, continuous streams—no bunching or choking up—and an equal amount goes into each furrow.

An even stand of grain is secured, because pressure springs compel all the discs to cut furrows of equal depth, and the forward closed delivery places seed at bottom of these furrows.

Van Brunt Drills never clog up. Scrapers keep discs absolutely clean. The high grade discs have bearings that are guaranteed to last lifetime of drill.

Smooth running—each wheel drives half the feeds, equally distributing the work. A direct, double gear drive from the continuous axle.

Grass seeder attachment can be furnished which will drill or sow broadcast as desired.

Van Brunt Broadcast Seeders are just as positive in their operation as Van Brunt Drills.

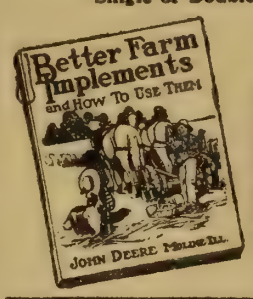
Write us for free booklets describing Van Brunt Single or Double Disc Drills, or Broadcast Seeders.

R. & V. Engines
Dependable Farm Power

"R & V" Triumph—always develops rated horse power—made in 1, 1½, 2½, 4, 6, 8, 10, 12, 16 and 20 H.P. sizes, stationary and portable.

Easily started; perfect speed control (speed can be varied 40 per cent without stopping engine). Complies with insurance regulations. Hopper cooled—a simple, efficient system that does not require long pipes and numerous fittings.

High grade throughout. Inspect the extra guard ring over piston pin to prevent possibility of scoring cylinder. Ask about the "R & V" oscillating mageto. Write for free booklet.



John Deere Dealers Everywhere
Better Farm Implements and How to Use Them

BOOK FREE—168 page reference book—tells all about a complete line of farm implements and how to adjust and use many of them. A practical encyclopedia of farm implements. Worth dollars. Describes and illustrates: Plows for Light Tractors; Steel and Chilled Walking and Riding Plows; Disc Plows; Cultivators; Spring Tooth and Spike Tooth Harrows; Lister Plows and Cultivators; Disc Harrows; Alfalfa and Beet Tools; Farm and Mountain Wagons; Teaming Gears; Manure Spreaders; Inside Cup and Portable Grain Elevators; Corn Shellers; Hay Loaders, Stackers, Sweep Rakes, Mowers, Self-Dump Sulky and Side Delivery Rakes; Hay Presses; Kaffir Headers; Grain Drills and Seeders; Grain Binders; Corn Binders; Gasoline Engines. This book sent free to every one who states what special implements he is interested in and asks for Package No. X-64.

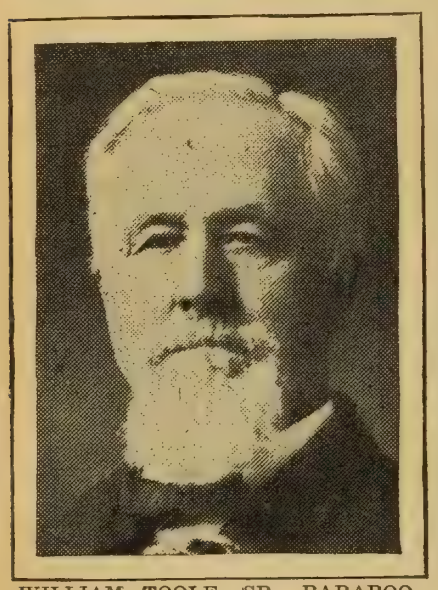
Wisconsin Horticulturists Meet.

Oldest Organization in Wisconsin Interested in Better Farming Methods---Fine Display of Fruit This Year at the State Show.

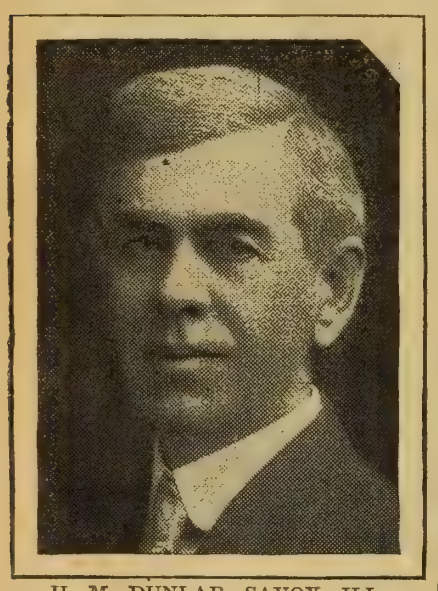
WISCONSIN farmers interested in orcharding, commercial fruit growers, lovers of flowers and others interested in horticulture who were so unfortunate as to be unable to attend the annual convention of the Wisconsin State Horticultural Society at Madison last week missed a rare treat. Although the attendance was not so large as formerly because of the epidemic of grip in the state, the program was of very fine quality and the addresses, which touched on all points of interest to the horticulturist, were of the very best. About 100 members attended the three-day sessions which were held in the assembly chambers.



WILLIAM TOOLE, SR., BARABOO, WIS.

C. L. RICHARDSON, CHIPPEWA FALLS, WIS.

The Wisconsin State Horticultural Society has the distinction of being the oldest organization in the state interested in improving farming conditions. Of course, its activities are not devoted entirely to the farm, but almost every farmer is in some way or other interested in horticulture or fruit growing and it is in this respect that the state association is listed as the pioneer agricultural organization of Wisconsin. It was more than a half century ago when this association sprung into existence and much of the advancement Wisconsin has made in fruit growing is the result of its work. Today the association has about 1,500 members and is now entering upon what it is hoped will be its most successful year.



H. M. DUNLAP, SAVOY, ILL.

C. A. HOFMANN, BARABOO, WIS.

Never was a finer display of fruit seen in connection with the society convention than was on display in the assembly parlor. The past year was a good one for the fruit growers of the state, although thousands of bushels of apples rotted on the ground. The growers took the proper care of their orchards and produced the good fruit, found a ready market for it at a good price and the necessity of producing good stock in order to make a profit was never more forcibly emphasized than last year. This was the word which all the delegates brought to the convention and it was generally conceded that orchardists who were complaining of the low prices and their inability to dispose of their crop did not have the fruit which the public demanded. Sec. Frederic Cranefield told an editor of The Wisconsin Farmer who had the pleasure to attend some of the sessions that the display of apples was the best ever gotten together at a meeting of the society.

Apple raising is on the increase in Wisconsin as well as other branches of orcharding and with an ideal climate and soil and other favorable conditions more growers are going into the industry each year on a larger scale. Marketing is also getting more attention now than ever before and the farmer who has an orchard too big for his family needs and which he does not have time to properly care for is being advised by many prominent horticulturists of the state to cut out some of the trees and care for just enough to supply his family and neighbors. If the grower of apples is to make money from this fruit the orchard must have attention the same as the cornfield and the keynote of many of the addresses of the convention were to this effect. The apple business of Wisconsin is now estimated at a million dollars a year.

The program of the convention was very interesting, starting with a splendid talk on orcharding conditions in the state by Gov. E. L. Philipp, who surprised some of the delegates with his knowledge of this branch of farming. Governor Philipp has an orchard on his farm and spoke of his experiences and the need of the proper care of orchards if the owner is to succeed. The great trouble with the orcharding business in Wisconsin, he said, is that it is too frequently considered a sideline on the farm with the result that thousands of orchards were neglected and the owners were then disappointed at the yield and the prices.

Climate, soil and accessibility to markets make fruit raising a natural industry for Wisconsin, as the governor explained, but this industry can never become what it should become if orchards are to be neglected and fruit growing considered a side line. Governor Philipp said that the need above all things in Wisconsin is more interest in good quality, cultivation and honest marketing and that a big market can never be built up for Wisconsin fruits if the growers put too good apples in the ends of the barrels and windfalls and wormy apples in the center.

Cultivation of orchards is another important matter, the governor explained, and predicted that at least nine-tenths of the orchards in the state are not cultivated. Often one sees apple trees in a hog yard and the governor emphasized that the farmer or orchardist who can't give an orchard the proper attention it demands should retire to some other occupation. The trimming and spraying of trees he also pointed out is quite important and predicted that with favorable climate, soil and market conditions that Wisconsin would win new laurels as a fruit state when the majority of the orchards were cultivated, sprayed and trimmed and the trees given the necessary attention.

The practical side of fruit growing was touched upon at length in addresses on spraying, the fight against insects, the codling moth, etc. George F. Potter, of the horticultural department of the college of agriculture, explained the use of sprays. In making up an arsenate of lead spray Mr. Potter recommended using powdered arsenate instead of paste arsenate, as it is not so much trouble and gives the same results. The proper proportions are from one and a fourth to one and a half pounds of arsenate to fifty gallons of water. Bordeaux and lime sulphur are the fungicide sprays and Mr. Potter explained the different uses of them. Bordeaux is best made at home, using four pounds of clean stone lime and four pounds of copper sulphate to fifty gallons of water. Lime sulphur is made up of one part lime sulphur to forty parts of water. Mr. Potter said that lime sulphur is used

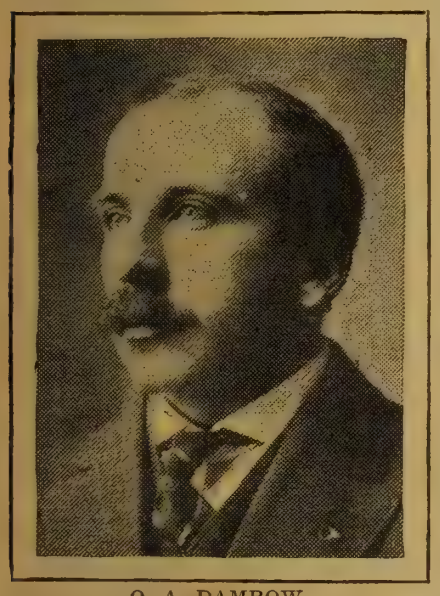
Talk Over the Cheese Situation.

State Cheesemakers Meet in Annual Session at Milwaukee and Have a Very Profitable Gathering.

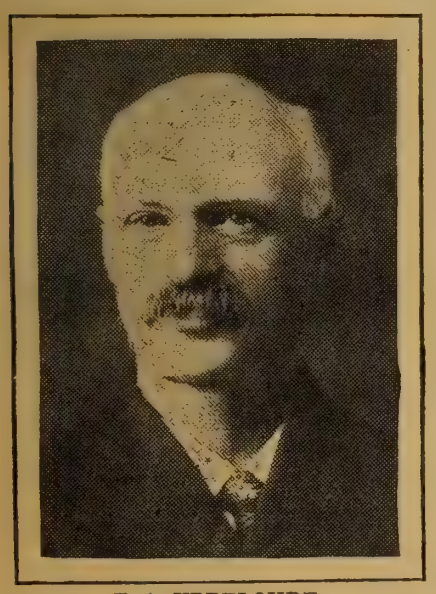
AS A FITTING climax to a very successful year in the cheese industry in Wisconsin, the Wisconsin Cheesemakers' Association last week held the largest and most successful convention and cheese exhibit in its history at Milwaukee. There are now about 2,200 cheese factories in the state, and conservative estimates are that 200,000,000 pounds were produced in 1915.

Prosperous conditions undoubtedly had much to do with the success of the convention last week, the twenty-fourth gathering of this organization which has had so much to do in the last two decades in building up this industry and in establishing for Wisconsin cheese an enviable reputation. Prices have been good the past year



O. A. DAMROW,
Retiring president Wisconsin Cheesemakers' Association.

following a period of depression due to the war and the product is moving very fast now. It was reported at the convention that every pound of cheese now in Wisconsin warehouses has a ready market waiting for it and the export trade the past twelve months has been especially heavy. What was lost at the beginning of the war by the decreased trade in the South has been more than made up by the renewed activity of the southern markets and the increased export sales. Canadian markets are also showing a decline and in addition to reports of a good year just past the convention delegates received reports of bright

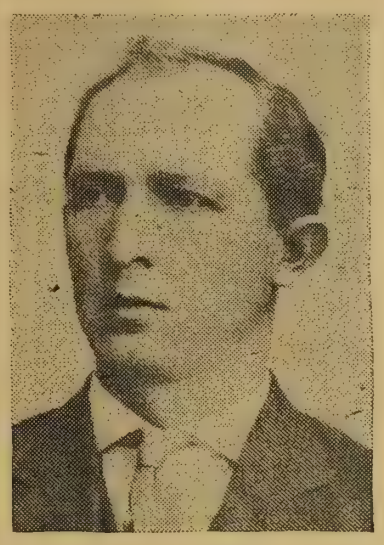


T. A. UBBELOHDE,
Treasurer Wisconsin Cheesemakers' Association.

prospects for the coming year with increased markets. Wisconsin factories are producing better than 55 per cent of the cheese made in America. The attendance was larger than at any previous gathering, there being more than 600 delegates in attendance. Likewise the interest was keener as the association is striving harder than ever for a better quality of cheese, and more makers and dealers are realizing the value of producing and handling a better product. Wisconsin produces as fine cheese as can be found anywhere, but some factories are not turning out as good cheese as they can turn out, and when all the cheese produced reaches the standard now set by the best cheese there will be a constant demand at a good price for every pound manufactured.

In connection with the convention there was held the usual cheese exhibit which was the largest ever held by the association. One hundred and eighty-nine cheesemakers exhibited their product. The showing in the American class, which included cheddars, twins, daisies, long-horns, prints and young Americas, was very strong and there were some splendid samples of Swiss, block, limburger and brick on display. Fred Marty, of Monroe, superintendent of the exhibit, told an editor of The Wisconsin Farmer who had the pleasure to attend the convention, that the quality of the cheese shown was exceedingly free and that it was the best and largest exhibit ever held in connection with the convention.

The importance of good milk if good cheese is to be manufactured was emphasized throughout the convention and it is here that the farmers can lend their assistance in raising to even higher levels the standard of this Wisconsin product. Without good milk good cheese is an impossibility and E. B. Williams, of Richland Center, who won first in the American class with a score of 97½ on his cheddar, told the delegates that good milk had much to do with his success in making the prize-winning cheese. Mr. Williams said that 75 per cent of his patrons had springs on their farms in which to set their cans of milk to keep it sweet and fresh and that such milk came to his factory in good condition. His prize-winning cheese was made on May 19th and has been in cold storage since that time. This cheese was not made specially for exhibition purposes. Mr. Williams, at that time, was handling about 4,000 pounds of milk daily. Other speakers pointed out the necessity of the farmers supplying good milk if good cheese is to be made and that this co-operation between farmer and cheesemaker is necessary. The better the cheese the better the price and an increase of as little as a quarter of a cent a pound would increase the cheese income in Wisconsin $500,000 a year. By supplying the proper kind of milk to bring about



A. T. BRUHN,
Retiring secretary Wisconsin Cheesemakers' Association.

this increased price the farmer will share in the additional income as the factory will be able to pay a better price for the raw product as it comes from the farm.

The past year has been very successful for the association which has increased its membership about 15 per cent, now having more than 500 members. The treasurer's report showed a balance in the treasury of $259 when the convention opened and the pro rata premium fund for exhibitors was increased to $500 when two years ago it was only $200. O. A. Damrow, of Sheboygan Falls, and A. T. Bruhn, of Spring Green, who have been president and secretary respectively for the past three years, retired and Charles Reade, of Neillsville, was chosen president, and Gus Sherick, of Plymouth, secretary to succeed them. Fred Marty, of Monroe, who was chosen secretary, had to decline the place, and Mr. Sherick was elected. H. P. A. Chaplin, of Plymouth, was elected vice president; T. A. Ubbelhode, of Glenbeulah, was again elected treasurer, and A. J. Noyes, of Muscoda, was named a director. Fond du Lac was chosen as the place for holding the 1917 convention. This will be the first meeting of the association outside of Milwaukee.

More local associations as a means of boosting the industry was recommended by many speakers, led by Mr. Damrow. The state organizations can be given great assistance through community organizations and it is hoped to form many local associations the coming year. These local associations are in closer touch with the farmer whose co-operation in producing better milk is essential and also afford the delegate who can't find time to ask questions at the state meeting an opportunity to air his views. They also provide a good means for exchanging ideas for the mutual benefit of all, and as auxiliaries of the state association they can do much towards improving conditions and prices.

Much interest was shown in the exhibit and the winning exhibits scored high. American cheeses were judged by J. D. Cannon, of New London and E. L. Aderhold, of Neenah, and the foreign cheese by G. Marty, of Madison, and Alex Schaller, of Barneveld. For showing the best American cheese Mr. Williams secured a cup, a gold watch and a chair. P. H. Casper, of Bear Creek, who was second with a score of 97¼, won a cup, and $50 in cash; and Fred Swenick, of Lloyd, who was third, received a cup and a gold watch. Robert Emmenegger, of Gratiot, who

Velie Six

Study These Features—Then See the Car

This latest Velie, Biltwel Model 22, has 40-horsepower Velie-Continental motor, 115-inch wheel base, removable cylinder head (for inspection), helical gears in motor, no chains, multiple dry-disc clutch, automatic ignition system, Velie-Stewart vacuum feed, push-button starting device and a long list of other surprises.

You are not far from the Velie factory. Why don't you take a run in here and look us over? If you like Model 22 as well as hundreds of others do you can jump in, take the wheel and drive it home, thereby saving freight charges.

Anyhow, pay us a visit and see the wonderful Velie factory. In the meantime write for a catalog. *Do* that.

Velie Motor Vehicle Company, 118 Velie Place, Moline, Ill.

$1065

showed the best round Swiss had a score of 96¾, while Rudolph Walti, of Barnaveld, showed the best block Swiss. First for brick and Muenster went to Anton Sutter, of Cambria; for brick to Fred Baertschi, of Mayville, and for limburger to Carl Frehner, of Beloit.

The program was well balanced and throughout the discussions the proposal of limiting the percentage of moisture was often heard. Mr. Aderhold said that the menace to the business today was cheese containing 44 per cent moisture, and some delegates favored a law limiting moisture when a happy medium had been struck. Some makers blamed the dealers for buying high moisture cheese and not paying any more for better grades of cheese than for this kind of cheese. Luther Noyes, of Muscoda, who spoke on "the business side of cheesemaking," told of his experiences with firm and soft cheese and said that it always paid to handle the firm stock, as it never came back from the retailers.

Discussions on the new license law occupied an entire afternoon and it was generally agreed that this will

JACOB KARLEN, JR.,
Director Wisconsin Cheesemakers' Association.

place cheesemaking upon a firmer business basis and likewise improve the Wisconsin standard. Prof. J. L. Sammis, of the college of agriculture, spoke of the future market for Wisconsin cheese and the payment of milk according to the yield of cheese. Wisconsin's principal competitors today, he said, are the 1,007 large factories in Ontario, which handle on an average 6,000 pounds of milk daily despite the fact that the Canadian production has fallen off 10 per cent in recent years. This, accordingly, widens Wisconsin's market.

The awards and scores of cheese exhibited follow:

Plow Corn Faster! Save Time And Labor Using Daisy Shields

Dont waste time and labor with old-fashioned cultivator shields. Put Daisy Revolving Shields on your cultivator—and plow the smallest corn as fast as you "lay by" the biggest.

BEST CULTIVATOR SHIELDS MADE

Daisy Shields beat them all—the best that money will buy. Save you one-fourth the time plowing and enable you to grow more corn on every acre. Absolutely prevent clods from falling on the corn—no stops to uncover corn. Fine dirt passes right through the Daisy Shields and covers the weeds and grass all round the hills. These shields revolve like a wheel over the ground; do not pick up trash and cannot get out of adjustment. Save their cost in time and labor over and over again in one season and are good for lifetime service.

A PAIR FOR YOUR INSPECTION

Investigate Daisy Shields. Write for folder and send dealer's name—We'll send a pair for your examination. Write today.

In and Around Wisconsin

The main building of the Watertown Creamery Company at Watertown was destroyed by fire recently at a loss of $6,000, partly covered by insurance. About 800 pounds of butter which was in stock, not including about 300 pounds in the shape of unchurned butter fat, was also destroyed.

Albert Fuller, of North Lake, Waukesha county, was elected president of the Milwaukee Milk Shippers' Association at the recent annual meeting. The farmers who are shipping to the Milwaukee market this winter complain that the prices are too low and Mr. Fuller predicts that unless better prices are obtained soon that a new market will be sought.

C. W. Harvey, secretary of the Dodge County Fair Association, announces that the 1916 fair will be held as usual at Beaver Dam on September 25th-29th inclusive. The Dodge County Fair, which ranks with the very best in the country, is growing better each year and the selection of the dates is the signal for the commencement of the advertising campaign for the 1916 exposition. Blotters and literature entitled "First Shot for 1916. World's Greatest County Fair" have already been printed and are now being distributed throughout the state and adjoining states.

The first annual meeting of the Wood County Cow-Testing Association was held recently at Vesper with a large attendance. Great enthusiasm was shown by the farmers in attendance and the old officers were all honored with re-election. E. E. Butters is president; J. C. Kieffer, vice president; W. W. Clark, secretary, and A. P. Bean, treasurer. The outlook for the coming year is very bright. Thirty-eight herds with nearly 500 cows are entered. Several new members were admitted and an expression of regret that William Bassler cannot continue this year in charge of the testing was voted. Farm management books were also distributed and several members entered the state farm management contest.

The annual report of E. R. Zamzow, of the Fond du Lac County Fair Association, brings out some very interesting facts. Principal among these is that the actual count shows that thirty-five more head of stock were shown at the fair at Fond du Lac last fall than were exhibited at the state fair at Milwaukee. The year was a very successful one for the association which paid off an indebtedness of $2,400 and received $2,500 in state aid. The increased stock exhibit required an expense for forage of $757, compared with $354 in 1914, and the total issue of premiums last fall was $4,509, compared with $3,100 in 1914. Improvements on the grounds cost $3,496 and the fair association starts the new year in good condition and with prospects for a big fair the coming fall.

Plans are readily forming for the annual convention of the Wisconsin Buttermakers' Association which will be held in Eau Claire the first week in February. G. H. Benkendorf, secretary, announces that the premium fund will total $750 which will be divided the same as last year—$2 to each exhibitor regularly enrolled, regardless of his score, and the remainder will be divided pro rata to butter scoring 90 or better. George J. Weigle, dairy and food commissioner, has offered a gold watch to the buttermaker receiving the highest score at the show. At first he offered a silver cup, but he later decided that a watch would prove more useful. All butter in order to be entered regularly must be sent not later than January 26th to C. J. Dodge, Eau Claire, Wisconsin. Butter shipped with bill of lading bearing date later than January 26th will be given a complimentary score only and will not be allowed to participate in the premium fund nor to compete for the prizes. In addition to the five state prizes previously announced thirty district prizes will also be awarded, which ought to make the butter exhibition a successful one. The program, entry blanks, tags, etc., will be mailed from Milwaukee in a few days. The convention judges will be C. E. Lee, assistant dairy and food commissioner, Madison; Wm. Schnieder, Johnson Creek, Wisconsin, and O. A. Storvick, United States Department of Agriculture, Albert Lea, Minn. The rules require that each exhibit must be a twenty-pound tub of butter. A ten-pound package will only be accepted for a complimentary score.

The Wisconsin Hemp Growers' Association at a recent meeting at Waupun, decided to change the name to the Waupun Hemp Company, incorporated with a capital stock of $20,000. Nine stockholders were appointed as managing directors. They are J. F. Mielke, G. Greenfield, J. H. Redeker, Wm. Abercrombie, A. F. Mielke, C. Lemmenes, A. F. Schultz, C. Prange, M. A. Vande Zande.

For the purpose of enlarging the scope of the fair at New Richmond, St. Croix county, a committee has been appointed there to incorporate a fair association and sell the necessary stock to put the fair upon a better basis. The same plan is being carried out in Dunn county. The new organization at New Richmond will have a capital stock of $10,000, divided into 1,000 shares with a limit of ten shares to a subscriber.

The sixth annual corn show and dairy school at Mosinee, Marathon county, will be held January 27th-28th and the program will be one of the best ever conducted there. Mosinee has won recognition as holding one of the best grain shows in the state and the speakers assigned there include L. F. Graber, Prof. G. C. Humphrey and H. W. Ullsberger, of the college of agriculture, and H. H. Humphrey, county field representative, and A. C. Burg, of the county school of agriculture.

The Brown County Guernsey Breeders' Association was organized recently with seventy-one charter members at a meeting which was held at the court house in Green Bay. The gathering was addressed by Prof. George C. Humphrey, of the college of agriculture, who pointed out the benefits of community associations and what other organizations along this line are doing for their respective counties. The meeting was well attended by Guernsey breeders and the following officers were elected for the first year: President, Charles Schmidt; vice president, Emil Jacobson; secretary, George O. Lucia; treasurer, Leon J. Delahant; directors, J. D. McAllister and A. H. Anderson.

LAW QUESTIONS.

Suit for Damages.

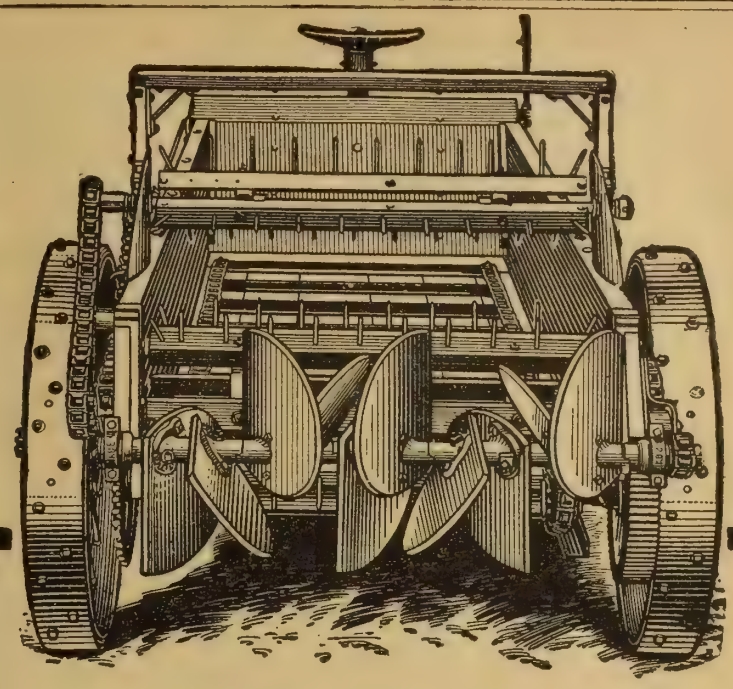
A Subscriber, Butterfield, Minn.—I had shipped to me from a tile company within this state a carload of No. 2 drain tile, and when the car arrived at the station I found 126 pieces of the tile broken. I had the railroad agent view the damages and he marked the car number and the amount of broken tile and I had to send the freight receipt to the tile company for freight allowance. Should I have done anything more in order to receive payment for the broken tile?

Answer.—If you are not paid for the loss occasioned by the broken tile you will have to employ a lawyer to bring suit for the loss.

Boundary Line—Adverse Possession.

A Subscriber, Caledonia, Wis.—The division fence between the farms of A and B has stood on the same line for forty-two years and has always been considered as the rightful and lawful partition fence by both landowners, in good faith, and without protest or interference by either. A uses a strip on his own land, a rod wide, running along the fence, as a lane and has so used it for twenty years. B sold his farm and the new owner had the land surveyed and claims a strip of A's land a rod wide, taking in said lane. Has he a right to move the line fence to include said strip in his farm?

Answer.—The new owner of B's farm has no right to move the fence to include the one-rod strip. The partition fence between the lands having been recognized by both owners as the division line for more than twenty years has become the lawful line by lapse of time, even if it is not on the original line, and each owner is entitled to hold the land up to said fence by adverse possession.



Let This Spreader Pile Up Profits for You

The New Idea Spreader pays its own way. It makes you enough extra profits to pay for itself in one year. Count the live stock on your farm and see for yourself.

If you're not getting $8.00 to $10.00 manure profit for every animal on your farm you are losing money. Fork spreading is wasteful. Some spots are not touched at all, others are covered too thickly and the soil is burned. You not only actually lose manure but you lose manurial value through improper handling.

To be most effective manure must be spread promptly and evenly, and the only way this can be done is by the use of the proper kind of spreader.

You need a machine that spreads wide and at uniform thickness. It must be built low down so as to load easily and of such light draft that two horses can readily pull it on ordinary soil.

The spreader you choose must be strongly built to resist hard usage, the manure must be delivered without loss or clogging, and the mechanism must be so arranged that it can be controlled from the driver's seat.

You get all these features and many others in the improved and patented

NEW IDEA Registered U.S.Pat.Off.

the spreader that's backed by 16 years' experience. It's 43 inches high at the highest point, and can be loaded with an easy throw of the fork. The chain conveyor brings every bit of manure to the double cylinder, where it is finely pulverized. No chance of clogging. There is a 17-inch clearance under conveyor and the wheels track for light draft.

From the cylinders the pulverized manure is thrown onto the revolving paddles of the steel distributor. These spread it 7 ft. as finely and evenly as though it were sown, The New Idea covers *three corn rows at once* and spreads out beyond the wagon tracks.

A Successful Chain-Drive Spreader

No gears or gear transmission. Conveying and spreading mechanisms are driven by a strong chain which will last for years. There is nothing to break or get out of order. Our conveyor does not rattle and will not race when going up hill. Without leaving his seat the driver can easily reach a lever which regulates the feed 3, 6, 9, 12, 15, 18 loads per acre. Pressure of a foot latch shuts off the feed. The New Idea is strongly braced at every point, especially in the rear, to prevent the frame from buckling under strain.

THE NEW IDEA 1 YEAR GUARANTEE

Written for your protection to prove to you that your investment is safe when you buy a New Idea. We absolutely guarantee this spreader for one year against breakage from any cause. We give you an unconditional and unlimited guarantee against defective material or workmanship. Under such a strong guarantee as this you can't go wrong because the New Idea simply must be exactly as represented.

We also build the "NISCO"—a special low-down type with narrow front truck.

This Book Worth Money — Write For a Copy. FREE

"Helping Mother Nature"—written by a farm expert for farmers who put thought in their work. It shows how to spread manure to get the best results and gives figures showing just how much extra money you can make from the proper use of manure. Ask the New Idea dealer for a free copy or write us.

Good Ventilation Starts With the Plan

THE general plan of the *King Ventilating System* is based on the right idea. Each *King System* is designed for the building in which it belongs. Just as no two barns are exactly alike, neither are any two conditions in barn ventilation the same.

How to handle those conditions in the most practical way comes from knowledge born of practical experience. Our skilled experts study the actual conditions in your barn and then design a *King System* to give you the best ventilation in all parts of the barn. This is what you get

When You Buy the

KING

System of Ventilation

Do not take any chances, experiments are always costly.

The *King* Aerator is the first part of the complete *King System*. No other ventilator works as well with the *King System* as the *King* Aerator: therefore, if you are not ready for the *System* buy the *King* Aerator and get started right.

If you are undecided or have any doubts about the enormous value of good ventilation, send ten cents to cover postage and packing and get

Prof. King's Book

which is the recognized authority on ventilation. It will be accompanied by our complete catalog *free*.

King Ventilating Company

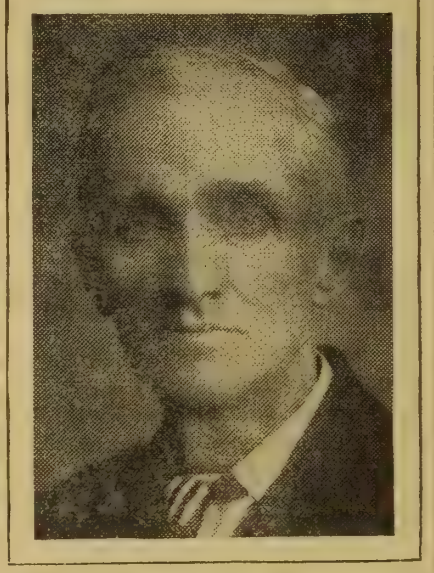
Wisconsin Poultry Show.

Birds of Fine Quality Shown at Madison Last Week—Awards and Exhibitors Lists—There Were About 800 Fowls Exhibited at the Show.

NEVER were birds of better quality shown at Madison than those exhibited last week at the annual show of the Wisconsin Poultry Association. The state association has held larger shows, but none better and what was lost in quantity this year was more than made up in the increased quality. Something like 800 fowls were exhibited by 108 exhibitors who came from all parts of the state, these exhibitors bringing only their very best stock so that



JOHN F. JOHNS, DODGEVILLE, WIS.

those who won at Madison can well feel proud of their birds.

The show was held in the live stock pavilion at the college of agriculture and a more ideal location could hardly be secured. The weather was not so good as it might have been and this cut down the attendance on the opening days.

For some reason not known to the fanciers most of the poultry shows this year are showing a falling off in the number of entries and the Madison state show proved no exception. The Chicago show this year was almost 1,000 birds short, but in every case the quality of the birds shown has improved. This is indeed an encouraging sign, as the fancier is beginning to realize that it is better to bring his best stock and leave those birds which have no chance to get into the money at home. To enter them means a useless expense for transportation, entrance fee, etc., and breeders who formerly brought thirty and forty birds to the Madison show are now bringing ten to twelve or fifteen of their best and returning home with just as much prize money. This has had a tendency to raise the quality of the show and make the competition all the keener.

In all the principal classes the competition at the state show at Madison last week was especially keen and several breeders who took firsts at the Chicago show and expected to sweep the boards at Madison had to be content with seconds and thirds, as several Chicago winners went down to defeat there. This was especially true in the Partridge classes and in the Barred Rocks, which was the largest class shown. The awarding of the ribbons was hotly contested. The Rhode Island Reds did not prove so strong in numbers this year at Madison as formerly, but some splendid birds were shown and we doubt if the quality as a whole was ever better. Last year the Reds led the Barred Rocks in number of entries.

Judging was by comparison and the ribbons were placed by W. E. Stanfield, of Hillsdale, Mich., and James A. Tucker, of Concord, Mich. Both judges were profuse in their praise of the quality of the fowls shown and Mr. Tucker remarked that the Barred Rocks were the best he had ever handled. Mr. Tucker also handled the White and Partridge Rocks, White and Partridge Wyandottes, Rhode Island Reds, Leghorns, Langshans, Campines and Sussex, while Mr. Stanfield judged the Buff Rocks, Buff, Silver, Golden and Columbian Wyandottes, Light Brahmas, Orpingtons, Polish, Andalusians and Minorcas.

Individual honors of the show went to John F. Johns, of Dodgeville, with his Barred Rocks and Black Langshans. Mr. Johns won six of the special awards, while T. O. Evans was a close competitor for individual honors with his White Wyandottes.

Mr. Johns won the bronze medal for the best cockerel in the show on his Barred Rock, the special gold premium for champion male in the American class on a Barred Rock and also the special for the champion male in the Asiatic class with a Black Langshan. Mr. Johns also had the best display of Langshans and won the American Poultry Association special for the best cockerel with a Barred Rock and he won the Langshan cup. Mr. Evans took the president's cup with his White Wyandottes for the best display in the American class, the $50 trophy for the best display of one variety, the best display of Wyandottes, the bronze medal for the best hen and also for the best pen.

L. I. Fairman, of Brodhead, had the best cock in the show on Black Orpingtons, the champion male in the English class on the same variety; William Bell, of Arlington, had the champion male in the Mediterranean class on Single Comb White Orpingtons in addition to the best display of Leghorns; Charles D. Love, of Waukesha, had the best pullet in the show on Golden Wyandotte; and F. W. Kramer, of Fort Atkinson, took the cup of the State Buff Plymouth Rock Club for the best cock, hen, cockerel and pullet and also the cup for best pen and silver cup for champion Buff Rock male. Honors for the best display of Plymouth Rocks went to J. W. Hunt, of Stoughton; for best display of Rhode Island Reds to John F. Mueller, of Fort Atkinson; for best display of Orpingtons to E. L. Bemis,

EXHIBITED BY JOHN F. JOHNS, OF DODGEVILLE, WIS.

of Fond du Lac; for best display of Brahmas to Mrs. L. A. Ross, of Belleville.

The Madison Business Men's cup, which must be won twice, for the best display of one variety went to Mr. Evans. It was won last year by E. L. Bemis, of Fond du Lac. Mr. Evans also won the president's cup for the

"BABY DOLL," EXHIBITED BY PRE FONTAINE.

best display in the American class, which cup last year was won by J. W. Hunt. It must be won three years. Mr. Johns with the best pen of Black Langshans has now won the Rowley cup twice in succession and must win it another year to become the permanent owner. Mr. Bemis, of Fond du Lac, with the best display of Orpingtons, becomes the possessor of the special cup which he won last year for the first time. John Mueller, of Fort Atkinson, also becomes owner of the

C. L. PRE FONTAINE, FOND DU LAC, WIS.

cup which he has won the second time this year with the best display of Rose Comb Rhode Island Reds.

The officers in charge of the show were:

President—M. C. Gerard, Stoughton.
First Vice President—W. H. Ashcraft, Janesville.
Second Vice President—John F. Johns, Dodgeville.
Secretary—James G. Halpin, Madison.
Treasurer—J. H. Durfee, Madison.
Directors—William Bell, Arlington; J. R. Love, Waukesha; Frank A. Cooper, Merrimack; Mrs. L. A. Ross, Belleville; C. L. Pre Fontaine, Fond du Lac.

Fanciers who exhibited were:

A. P. Anderson, Sparta; Geo. Beckmann, Ixonia; B. A. Beach, Madison; Wm. Bell, Arlington; E. L. Bemis, Fond du Lac; Elmer Biddick, Livingston; H. R. Bird, Ridgeway; John Blanchard, Columbus; Julius D. Bossmann, Horicoon; Geo. A. Buckstaff, Oshkosh; H. R. Burrington, Sun Prairie; W. Buth, Sullivan; N. Roy Beckmann, Albany; F. H. Some Practical Potato Hints.

A Continuation of the Series of Letters From Growers, the First of Which Were Published in The Wisconsin Farmer Last Week.

Is Partial to the Russet.

To the Editor:—I am greatly interested in what the farmer is doing and as our subject leads us mainly to potato culture I will give you my experience in this line. I have one acre of land I have used for the last fourteen years as a truck garden. Two on which I have tried every variety of potatoes that are grown in Wisconsin with various results. My land being in fine condition I always had an enormous yield, but the stock never looked to me like perfect stock should look, so I cast about for a reason and soon discovered that my ground was too rich for successful potato growing of the ordinary varieties, such as Green Mountain, Triumph, Cobblers and Rurals, Early Ohio, Early Rose. I finally concluded to try the Russets, of which I am now going to speak. The first year, this being in 1911, I planted two bushels of this seed in the very best part of the garden where I had potatoes the year before. This, you will say, is not a wise plan. I know it, but I was determined to try the Russet out. What was my surprise when I came to digging those potatoes in the latter part of September no one can imagine. I had eighty bushels of the finest and cleanest potatoes that ever came out of the ground. Since then I have given my attention to this variety almost entirely.

Now as to the method of culture. Here is the way I do it: I plant about the 20th of May, no later. Some say this is too early, but let me tell you that there are more mistakes made in planting too late than too early. Some will tell you the bugs are worse on early planting, but you can fight the bug easier than the frost and you will have a better tuber and a tuber that will not peal off at digging time, the source of all your trouble marketing time is getting your price. But back to my plan, if you want to try the Russet plant as above stated the 20th of May, three feet apart in rows six inches deep. They need plenty of room, as the tubers spread. Have your ground good and rich and keep the ground loose and free from weeds and if you fail the fault is yours.

There is no better potato raised in the United States than the Russet. They will keep the year round with ordinary care. Will sell for a better price than other potatoes. Try them and be convinced. Charles Gehrke.

Langlade Co., Wisconsin.

A Waupaca Grower's Experience.

To the Editor:—In the matter of raising potatoes the same general rules apply as in all other branches of farm activity. It matters not if the farmer is confining himself to some special line of farm operations or following a general system of mixed farming with the ordinary crops and one or more lines of live stock there are certain fundamental rules that apply and must be observed in order to obtain the best results. In offering a few suggestions I do not wish to pose as a critic or as an expert, and yet we will all agree that a farmer, or anyone else, for that matter, cannot follow up any line of work for a number of years with any great amount of interest without learning something unless he is a past master of the "know-it-all" club or a fit candidate for the insane asylum. Almost any fertile, well-drained soil will raise potatoes, but some soils are better than others. Perhaps a sandy loam soil is the very best, but success with potatoes does not depend so much upon the natural composition of the soil as it does upon the management of that soil and also of the crop. Whatever the soil may be it must be well drained, rich and mellow. We hear much objection to a heavy clay soil for potatoes, but our belief is that it is not a matter of soil as much as of the way that soil is managed. At any rate, the farmer must use such soil as he has and the first step in any event is the preparation of that soil. First, plow deep, the heavier the soil the deeper it should be plowed and plow the heavy soils in the fall, particularly so if there is a heavy sod. We prefer clover sod to a heavier timothy or June grass sod. If possible, plow under the second crop of clover, there is nothing equal to that. Barnyard manure is good if not too fresh. Our experience convinces us that fresh barnyard manure produces favorable conditions for the scab germ. We prefer to apply our manure to the clover land a year ahead of our potato crop. By so doing we kill two birds with one stone. We increase our hay crop and relatively the clover roots which give a large amount of vegetable matter in the soil and also this large clover root development leaves the soil in the very best condition. (Let me digress just enough to say that it is our opinion that a great many farmers fail to appreciate the mechanical effect upon the soil of the root system of the clover and alfalfa plants, their effect upon the water supply both in draining and supplying, as well as in the air supply of the soil, which again affects the temperature of the soil. These tiny rootlets assisted by other things just as small and apparently insignificant produce the great forces of nature). After the land is plowed it should be thoroughly pulverized with disk, roller and harrow, either one or all, as the conditions demand. Now comes the seed problem and right here is the place where many farmers fall down. All I will say is this: Use the same care with your potato seed as you do with your live stock breeding, always bearing in mind this, "like produces like." First, plant your seed, that is, seed free from varietal mixture. Second, plant seed free from disease, of good size and good type. Seed from hill-selected stock, of course, is the best. If your land is poor and your trouble is that your potatoes do not grow large enough cut your seed to one good, strong eye to the hill. If, on the other hand, your potatoes grow too large, plant whole potatoes and plant thicker together. These things being done, just take good care of the crop. Harrow the field thoroughly just as the potatoes are coming up. Do this with a good weeder or a light harrow, then cultivate. Keep the surface fine, level and mellow. Keep out the weeds and feed the bugs Paris green or arsenate of lead. This with favorable weather conditions should insure a satisfactory crop.

F. R. Constance.

Waupaca Co., Wisconsin.

Most persons, if asked which we use the more of, salt or sugar, probably would say sugar, but the statisticians at Washington figure that the per capita consumption of salt in the United States last year was almost exactly 100 pounds, and of sugar 89.14. The statement is, however, somewhat misleading. No person could eat two pounds of salt a week and expect to live. Much that is set down to the per capita consumption is really used in curing meat and fish that later on are exported, and in making pickles and freezing ice cream. We consume more ice cream than all the rest of the world put together.

Several fruit growers stated at the horticultural society's meeting that they were able to get top prices for fruit sold through commission men. Inquiry showed that these men have established a reputation for good packing and good fruit, and the commission men are anxious to get their fruit.

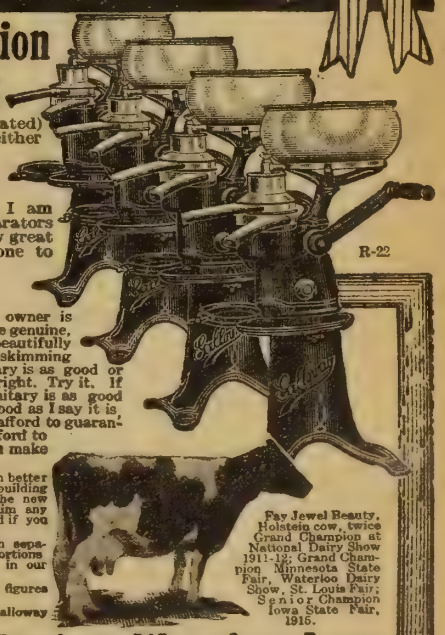
NEW 1916 LOWER Wholesale Prices

Every Galloway Separator a Thoroughbred Champion

Its beautiful design, its clean cut lines, the material with which it is built, its bearings, the precision with which its gears are cut stamp it a thoroughbred. Its clean skimming, its wearing and lasting qualities, its ease of operation, its under-rated (and not over-rated) capacity stamp it a champion—just as much a champion as either one of the wonderful cows shown below.



R-22

Down Go Prices—Up Goes Quality

I have cut cream separator prices again. Why? Because I am buying material for less money than ever, turning out separators on high class, automatic machinery faster than ever from my great factories, and because every separator I put out sells from one to a dozen more.

Spreads Like Wildfire

The Galloway Cream Separator fever spreads like wildfire. Every cow owner is getting it. He knows that he will get more separator for less money—more genuine, honest, high-grade material and workmanship built into this high-quality, beautifully finished machine than he can get anywhere else in the country. The best skimming service for less money. Where other separators are good the New Sanitary is as good or better. Where others are wrong the New Sanitary is right, absolutely right. Try it, you like it, buy it; if you don't send it back. If the New Galloway Sanitary is as good as I say it is, you can't afford to buy any other kind. If it is not as good as I say it is then I could not afford to offer it to you for a 90-day trial. I couldn't afford to guarantee it for 10 years against defective workmanship and material. I couldn't afford to back it with a $25,000 guarantee bond. You save money when you buy it. You make money when you use it.

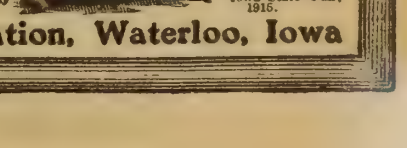
Nona Spencer, Ayrshire heifer. Grand Champion over all females Iowa and Minnesota State Fairs, Waterloo Dairy Show; Junior Champion St. Louis, 1915.

True, some separators are sold for less money, but they are not Galloway separators. When better separators are built Galloway will build them. If you knew all there is to know about building cream separators and had one built to your order, it would not be a better machine than the new 1916 Galloway Sanitary bath-in-oil cream separator. It would not run any easier nor skim any closer; could not be built of better material nor would it be more perfectly sanitary. And if you built as good a machine as the new Galloway Sanitary, you could not sell it at a lower price.

Remember, we took four years to perfect this separator, to build into it every good cream separator feature and at the same time retain simplicity and design a machine of beautiful proportions. This separator has not been built down to a price, but has been built up to a high standard in our own factories right here in Waterloo.

Don't get fooled on separators only assembled by so-called manufacturers and priced at figures you positively know a satisfactory cream separator cannot be built for.

Ask today for my new complete list of New Low 1916 Wholesale Prices on the New Galloway Sanitary and for my 160-page four-color catalog.



Fay Jewel Beauty, Holstein cow, twice Grand Champion at National Dairy Show 1911-12; Grand Champion Minnesota State Fair, Waterloo Dairy Show, St. Louis Fair; Senior Champion Iowa State Fair, 1915.

WM. GALLOWAY COMPANY, 33 Galloway Station, Waterloo, Iowa

Fruit and Garden

SEED POTATO CERTIFICATION IN WISCONSIN.

The second year of seed potato certification work in Wisconsin has been completed and certificates are now being issued by the horticultural department of the college of agriculture to those growers whose seed was found satisfactory. The growth of this service during the past year has been phenomenal and a great work has been done in elevating the potato industry in Wisconsin. During the past year 1,225 acres of seed potatoes were inspected compared with 350 acres the previous year and certificates are being issued to 106 growers as compared with forty-eight certificates last year. Mr. J. G. Milward, who has been in charge of the inspection work, reports a very satisfactory year, and with prospects for a much larger inspection area this year.

The stock certified amounts in total to 57,000 bushels divided on a variety estimate as follows: Rural New Yorker, 35,000 bushels; Green Mountain, 18,000 bushels; the balance of 6,000 bushels represents the combined stock of Burbank, Peerless, Early Ohio and Irish Cobbler. Mr. Milward's books show that there were 172 applicants for certificates, of which 106 were issued and sixty-six either withdrawn or rejected. The general causes for rejection were mixtures, diseases and undesirable cultural conditions. Of the total acreage of 1,225 acres 650 acres were certified and 575 rejected.

In the handling of the season's work the successful applicants for certificates on the whole did careful work. The standard of the certified seed available is far above that commonly offered for sale, notwithstanding a season when serious losses resulted from late blight, rot and field frost. Mr. Milward reports that there is still considerable misunderstanding between the seed growing and seed buying interests as to what conditions should be allowed under the certificate. This confusion is in part unavoidable, but the commercial exhibits in Wisconsin showing certified seed as offered for sale will be of service in establishing a more uniform understanding of seed standards. This condition led to the exhibit at the Marinette convention last fall of certified seed showing the stock just as it can be purchased from the growers.

In a circular which is now on the press and which will be ready for distribution soon the attention of growers and buyers is called to the important features of the standard under which certificates were issued. This circular also gives the list of those who were given certificates and discusses the effect of the early frosts and disease on the crop. Copies of this circular can be secured from the horticultural department of the college of agriculture at Madison.

Damage from late blight rot and field frost were unusually severe in several sections of the state. The final inspection of the seed stock in the bin, however, shows that on the whole, applicants for certificates have sorted carefully and the inspectors are confident that a large amount of high-class seed will be available for distribution.

The early frosts, which occurred during August 27th-29th, shortened the crop materially in several sections of the state. As a result, many fields which showed excellent vine growth and vigor at the first inspection have yielded a high percentage of small or medium-sized stock. The inspection service regards clean, sound stock of this character valuable for seed, and has adopted a liberal interpretation on size standards.

These early frosts actually benefited general conditions in such sections by checking the development of late blight, and as a result, frosted fields showed a very small percentage of loss from rot.

The inspection service urges upon holders of certificates the necessity of strict conformity to the standard required under the certificate. The issuance of a certificate implies a responsibility upon the inspection service that the seed stock shall be true to name and safe for seed from the standpoint of disease infestation. Special care has been taken in Wisconsin to adopt a standard which should be consistent with the possibilities of potato production under good conditions of culture. It seems apparent that any plan of certification to be of service in potato development work must make the holder of a certificate directly responsible for the final grade of seed shipments.

In justice to this work, the seed buying public should also understand that certified seed is not selected to such a uniform size and shape as is exhibit stock, shown at state potato exhibits. Some confusion and difficulty has been encountered through the common misunderstanding that such is the case. Some of the best seed stock will range from three to seven ounces.

Common scab, rhizoctonia, late blight rot, leaf roll troubles and black leg have been found under the very best cultural conditions. Serious infestation has resulted in the refusal to issue certificates to about sixty applicants. Some certificates have been issued involving as a condition special instructions on the removal of common scab, rhizoctonia, and dry rot.

The inspection service also recommends to growers with certificates that they use special seed potato shipping tags which can be secured from a Madison firm. The cost ranges from $1.50 for fifty tags to $6.50 for 1,000 tags. Special burlap sacks can also be obtained; one bushel sizes at $70 per thousand; two bushel size at $87.50 and half bushel size at $55. On these bags will be printed the name of the grower, postoffice address and variety for $2 per thousand or less quantity.

PROGRAM FOR ANNUAL MEETING ALFALFA ORDER.

Farmer-Banker Co-operation.

Plans Which Have Been Worked Out at Blooming Prairie, Minnesota, Have Proved to Be Profitable to All Concerned.

NO BETTER example of the co-operation between banker and farmer, with profit to each, could be asked for than is to be found in Blooming Prairie, Minn., where Sam A Rask, the hustling vice president and cashier of the First National Bank, has installed and furnished a community club room designed particularly for farmers and their families, without any cost whatever to those who benefit by his generosity. Mr. Rask has long been of the opinion that such a club room was needed. Consequently, when the First National Bank had under consideration the erection of a new building Mr. Rask's idea for a community center and rest room was incorporated in the plans. We are indebted to the Blooming Prairie Times for the following description of the rooms which Mr. Rask has provided not only for farmer patrons of his bank but for farmers generally.

HANDSOME NEW HOME OF THE FIRST NATIONAL BANK, BLOOMING PRAIRIE, MINN.

The entrance to the room is by the door leading to the hallway on the east side of the First National Bank building. The hallway leads to about the center of the building, where a stairway leads to the basement. At the foot of the stairs as you enter the basement are coat and hat hooks. On turning to the left you see a large opening without doors leading directly into the club room. On your left as you enter and at the end of the hall leading to the large room is a well-equipped lavatory with sanitary drinking fountain, wash bowl, sanitary paper towels and other modern conveniences.

The spacious club room is light, well ventilated, steam heated and gives an impression of comfort, cleanliness and convenience. The walls and ceiling are plastered and finished in pure white, the cement floor is to be painted in some appropriate color. The walls are hung with a profusion of pictures of prize-winning animals of all kinds. A electric clock is always announcing the correct time; an electric fan relieves the heat and aids in keeping the air in motion when necessary; a telephone hangs in a convenient place for the free use of the public; a bulletin board has the latest publications from the agricultural schools or other important announcements that would be interesting to the public and especially to the farmers. A large writing table is provided with pens, ink and stationery, as well as a liberal amount of reading matter, such as the latest magazines, the local papers, and the more bulky agricultural bulletins. Near this table Professor McCall has a desk and will be found here on Saturdays and when there are no school duties to hinder him and will here be ready to meet the farmers for consultation and advice.

FARMERS' REST ROOMS, FIRST NATIONAL BANK, BLOOMING PRAIRIE, MINN.

The club rooms are proving popular beyond even the expectations of Mr. Rask and his associates in the bank, and are filling a long-felt want. Mr. Rask has some earnest and definite convictions on the duties of members of the community to every other member, and expresses them in this manner:

Obviously, we did not figure on any direct profit from our rooms. It has always been my opinion that anyone who lives in a community and who makes money in that community owes something to the people of that community. Actually, therefore, we are only paying a just debt; if not a legal one, then surely a moral one. It would seem to me that this proposition would hold good in any locality. In my mind, the community spirit should be encouraged and fostered, not only by the people of the country, but by the people of the towns and cities. The best way to do this is to provide facilities and opportunities for getting together.

It is sincerely to be hoped that the example of the First National Bank and of Mr. Rask will be followed generally. No matter is of more importance than this of providing proper rest rooms and accommodations for both sexes for the comfort and convenience of farmers and their families while in town. Nor is the cost prohibitive to any banker or merchant who may wish to do what Mr. Rask has done. The rooms which are prodided at Blooming Prairie could have been rented by the first National Bank for $15, this being the sum offered them. In addition, the bank furnishes heat, light, telephone service and janitor, the total cost aggregating about $25 a month. In view of the community spirit fostered, the comfort of hundreds of rural visitors and the satisfaction of doing a much-needed work, the cost is small indeed.

If you were unfortunate enough to miss the meeting of the state horticultural society early in December, make a special effort to attend the farmers' short course at University Farm, January 3d-8th. The week's expenses, including board, etc., at the farm, need not exceed $6. You can't very often put in a week so filled with good things at that price.—[L. Cady, associate horticulturist, University Farm, St. Paul, Minnesota.

Dr. David Roberts' BREEDING TONIC

Your cows should be prepared for calving time. Heifers especially need help. Dr. Roberts, during his more than 25 years' veterinary practice, compounded a prescription which is a wonderful aid to cows in this dangerous period. It has an affinity for the genital organs and puts them in a breeding condition. Give your cows this help which they so much need. Feed in small quantities during pregnancy—it will mean strong, healthy calves. They will be dropped naturally—least injury to cows, less chance for abortion and complications. Cows fed Breeding Tonic do not retain the afterbirth. Breeding Tonic gives to breeding mares, ewes and sows the same help it does to cows. Get Breeding Tonic from your druggist.

Cow Tonic to tone and keep your animals in condition, aid digestion and keep up appetite.

Cow Cleaner removes the afterbirth naturally. Heals and leaves breeding organs in normal condition.

Calf Cholera Remedy prevents scours and calf cholera. Keeps calfs in continuous growth.

Calf Meal, Diolice, Badger Balm, Laxotonic and Stokvigor—valuable remedies, which should always be kept on hand.

Special Sample Offer
STOKVIGOR, 10c

Enough to feed a cow two weeks. Aids digestion, tones the system, makes animals grow faster and develop better. Send 10c and we will send Special Sample Package to test on your own stock. Don't fail—don't wait. Enclose dime or stamps.

Get Dr. Roberts' Live Stock Prescriptions at your drug store—nearly 4000 dealers in U. S. If you do not already have the 184-page "Practical Home Veterinarian," treating all diseases of all live stock, send 25c and receive by mail, postpaid. Address

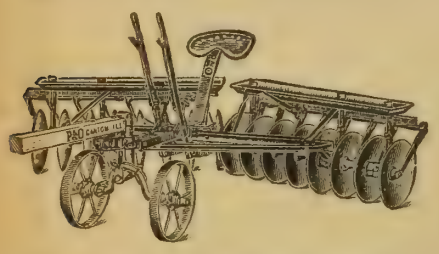
Scotch Knocker Cloth Faced Horse Collars

P&O

STAR DISC HARROWS

Made in 4, 5, 6, 7, 8, 9 and 10 ft. sizes, with 16, 18 or 20 in. discs. Can furnish plain, cut-out or plow-cut discs. With or without weight boxes. Tandem Attachments, Tongue Trucks, Third Lever Attachments, Transport Trucks and Seeder Attachments furnished when ordered.



The steel frame is riveted and braced to the tongue in three places, affording great strength. Low hitch, with tongue and clevis in line of draft, avoiding neck weight. Hard maple oil-soaked bearings, cheaply replaced when worn out. A simple device locks scrapers against discs, away from discs or in position to be operated by foot levers. Each gang operated by its own lever and can be set at any desired angle. Heavy bumpers relieve the bearings of all end pressure. Will do efficient work in dead or back furrows.

A third lever attachment can be furnished which gives more penetrating power and a wide range of adjustments of depth. Highest quality steel discs, carefully sharpened and polished. Curved pull irons hold the harrow level at all angles. P & O Disc Harrows have been made for sixty years and are standard the country over. "It's the Way We Build Them."

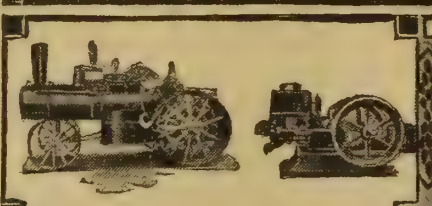
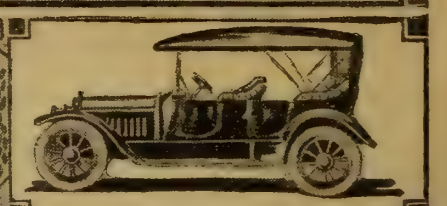
FARM MECHANICS



Auto, Farm Engine and Farm Machinery Ailments diagnosed and remedies suggested in this department



QUESTIONS AND ANSWERS.

Bosch Magneto for Lighting.

Can a Bosch high-tension magneto be used to run two lights?

Answer.—It cannot.

Carburetor Trouble.

I have a model 1916 Oldsmobile equipped with a Marvel carburetor. When on a hard pull it starts to spit and keeps it up for a minute or two. I have to be very careful not to flood it. It is not dirt, as I have taken it apart several times without finding anything. What is the cause?

Answer.—Adjust the suction damper so as to give less suction and more air. Evidently the suction is now so great that it draws too much gasoline out of the spraying nozzle, causing the carburetor to flood and making the mixture too rich.

Clutch "Spins."

The other day when running my car I found it impossible to shift from high to intermediate. The next day I had no trouble. There was a Buick driver who told me he had the same experience. How can it be explained?

Answer.—The trouble was due to a "spinning" clutch, that is, the clutch keeps running when released, due to friction between the clutch and the engine shaft. The trouble can be overcome by placing a leather-faced pad in such a position that the back of the clutch cone rubs against it when the clutch is released, forming a brake. The clutch should be nearly still when the gears are shifted.

Rings Worn Out.

I have a Fairbanks-Morse gas engine. It has been in use six years for pumping water for stock. About three weeks ago it began to lose speed. It exhausts heavily four or five times and then slows down till it almost stops and then exhausts again. I have cleaned it, but cannot find the trouble. Can you help me?

Answer.—The piston rings have become worn so that too much oil works past them into the combustion chamber. Do not use quite so much oil. If your engine continues to smoke it will be necessary to obtain new rings and possibly a new piston. If the cylinder is worn badly out of round have it rebored and a new piston fitted.

An Air Leak.

I have a 1910 Model T Ford. Cylinder number one misses when the throttle is down six or eight notches. When running idle with the throttle open three or four notches and the spark retarded, it seems to fire perfectly. When on the road pulling up grade five miles per hour it fires perfectly with the spark either advanced or retarded. It fires weak in number one cylinder as soon as it speeds up to eight miles per hour I have a new coil. I have changed the units about and have tested for weak valve springs. The compression seems equal on all the cylinders. I have used kerosene to remove the carbon. It misses just the same with a clean spark plug. What is wrong?

Answer.—The most probable cause is an air leak either at the joint between the inlet manifold and the cylinder or around the inlet valve stems. Poor contact at the commutator points, due to wear, dirt or oil, or a weak exhaust valve spring would cause the same trouble.

Engine for Ensilage Cutter.

I have a thirty-five-horse-power Mitchell auto engine. Would this engine have power enough to pull an eighteen-inch ensilage cutter? I have raised the engine level in the frame and have installed a shaft at the back end, driven by a clutch and universal joint. I will mount a pulley on the end of the shaft. Is this practical? What size pulley should I use? What is the speed of the engine? What horse power should the engine develop? The ensilage cutter should run 800 revolutions per minute.

Answer.—If the engine is in fair condition it has enough power to run the ensilage cutter. The engine should develop thirty-five horse power at a speed of 1,500 R. P. M. For a steady load it should not be run at over 1,000 R. P. M. At this speed it should deliver twenty to twenty-five horse power. Use a pulley on the shaft eight inches in diameter and having a six-inch face. The pulley on the cutter should be somewhat larger, say ten inches in diameter. Your plan is practical if the shaft is supported so as not to put too much strain on the universal joint.

Lights Burn Out.

How can I prevent my dash light bulb on my Ford car from burning out when operated from the magneto?

Answer.—Use bulbs of greater voltage. The higher the voltage the less danger of burning out, but also the less the light, especially at slow speeds. There are automatic voltage regulators on the market for Ford cars. If you are interested in these consult your auto dealer.

Speed of Two-Cycle Engine.

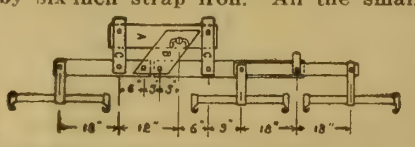
I have a two-cycle gas engine that runs fairly well, but does not have the speed that I desire. What can I do to give it more speed? What is the difference between a "high-speed" and a "low-speed" carburetor? Should the "plus" terminal of a storage battery be connected to the coil, the timer, or the ground?

Answer.—Two-cycle motors are slow compared with four-cycle motors. The speed may be increased by increasing the size of the inlet and exhaust ports and using as weak a check valve spring as practical. A high-speed carburetor has its best adjustment at high speed. A low-speed carburetor works best at low speed. A carburetor seldom works equally well at all speeds. Either terminal of a storage battery may be grounded, the other terminal being connected with the coil.

A Three-Horse Evener.

Please give me the measurements for making a three-horse evener for a wagon.

Answer.—The figure shows the principal length dimensions, the dimensions being given in inches. The doubletree, A, may be made from a piece of two-by-six-inch oak. There should be two plates shaped like B, one on the top, the other on the bottom. B may be made of one-half inch by six-inch strap iron. All the small



squares represent the heads of machine bolts, five-eighths of an inch in diameter. CC are U-shaped straps made from one-half by two-inch iron. The doubletree for the two horses rests on top of the evener. Ordinary singletrees should be used, connected by the usual link or hook. Unless you have nearly all the parts it will not pay you to make this evener, as a pressed steel evener somewhat like the above may be purchased from your implement dealer for $6.25.

A Homemade Tractor.

I am thinking of making a tractor and would like your opinion of my idea. I have a ten-horse-power Birdsal steam traction engine. I am thinking of buying a new forty-five-horse-power auto motor and using the gears, steering gear, front wheels and drivers of the steam engine, replacing any gears necessary to obtain a speed of two and one-half miles per hour. I would use heavy channel iron for the frame and use heavy parts wherever possible so as to give weight to the machine. The drivers are five feet high and ten inches wide. Are the drivers wide enough? How heavy should the machine be? How many horse power should it deliver at the drawbar? How many plows would it pull? How many tons would it pull in one wagon on an average road? Do you think it would pay me to buy the engine and do the work myself, or buy a new tractor? I have a blacksmith shop, and can do all the work.

Answer.—Your plan seems practical as far as you have outlined it. Gear the machine so that it will travel two miles per hour at 800 R. P. M. of the engine. The machine should pull two fourteen-inch plows under any condition and three fourteen-inch plows under ordinary conditions. The drivers are wide enough for the two fourteen-inch plows, but when pulling three plows you might need extension rims. The tractor should deliver twelve to fifteen horse power at the drawbar. The tractor should weigh between 4,000 and 5,000 pounds. It should pull two tons easily. If you are familiar with this class of work it may pay you to make your own tractor. As a general thing we would say that it would not pay. There are several fair tractors on the market for less than $1,000 capable of pulling two plows. The manufacturers of these machines have learned by dear experience what it takes to make a successful tractor. The farmer building his own machine begins at about the same place they did and he, too, is likely to buy some dear experience.

Motor Misses at Low Speed.

I have a 1913 Ford car equipped with an Atwater-Kent system. When the engine is not pulling hard it will miss, but when going at a good speed up hill it runs fine. I found oil in the two front cylinders when I removed the cylinder head. What is your advice as to the trouble?

Answer.—Increase the gap at the spark plug points and clean the plugs. See that the distance between push rod and valve stem is not over one-thirty-second of an inch. Examine the intake manifold for air leaks. See that the carburetor and vibrator points are properly adjusted. If you have trouble with smoke and fouled plugs in the two front cylinders use larger pistons.

Using a Level.

I have a small farm level on a tripod. In some of my work with it I have allowed it to stand in one position for several hours. When standing thus the bubble invariably shifts so as to indicate that it is not level. I suppose this variation is due to the sun's attraction for the liquid in the tube. But how is one to avoid the errors that are sure to result from such a varying standard?

Answer.—If the instrument is carefully leveled just before the observation is taken the results will be accurate enough for practical purposes. Very accurate scientific work is done in basements, the instruments being mounted on heavy concrete foundations to avoid vibration and temperature changes.

Use of Magneto Distributor.

What is gained or why is it necessary to have both a timer and a distributor on a magneto? Does not the distributor do the same work as the timer, besides distributing the current?

Answer.—The timer makes or breaks the low tension current at the correct instant to ignite the charge. The use of the distributor is to send the high-tension current to the proper cylinder. The high-tension current is produced at the instant the timer closes or breaks the low-tension current, depending upon the type of magneto. The distributor does not time the spark. The timing must be done with the low-tension current, owing to the tendency of the high-tension current to "jump."

Vaccination by a new and very advantageous method has been fully investigated and reported upon favorably by Dr. H. W. Hill. These experiments were begun by Dr. Hill several years ago while he was epidemiologist of the state board of health, and have just been finished at London, Ontario. The method is known as acupuncture. A drop of vaccine is placed on the cleansed arm, then a sterile needle is introduced through the vaccine into the upper layer of the skin only, in several places. It does not go deep enough to draw blood. This method eliminates sore arms and the possibility of developing tetanus. With this convenient and safe manner of protection no one should hesitate to become protected against small pox. —[Dr. I. J. Murphy, secretary, Minnesota Public Health Association.

PLAN TO AID SETTLERS.

To the Editor:—I am very much pleased to note the interest you are taking in the development of Upper Wisconsin and the welfare of the farmers, and hope you will continue to push the good work on until the last acre is developed.

My suggestion for the speedy development of Upper Wisconsin would be some means of credit for the settler to enable him to stay at home to clear and develop his farm and not have to go and look for work to get money to feed and clothe his family, pay interest and taxes. A man that has to do this will be a long time clearing and paying for his farm, although there are a great number of settlers doing this and making good, but it is a shame to allow this to go on when help can be had, as life is too short and a man working under these conditions spends the best part of his life to get his farm well improved, and that is speaking well for him and the country at that. I have made an investigation of conditions in the wooded country all over the United States and find that Upper Wisconsin, Michigan and Minnesota have a great many advantages over the rest of the country. There is plenty of good water, the mining district furnishes the best of markets and the clover, which is the best and cheapest method to keep land up, and the backbone of a dairy country, grows in abundance all through the brush where the heavy timber has been cut off.

We have plenty of men working in our cities with a small amount of money saved up who were raised on farms and would gladly go back to the farm if there was some help in sight. These are the men we want on the farms in this country. They will make good, as they, themselves, will do the work of improving.

The trouble with so many men with money going on land from the cities and not making what they ought to is they have no experience in clearing and developing the farm; they have to depend all on hired help, which proves very costly.

As to providing money to help these people clear and improve their land, why not have the county issue a special improvement bond, in denominations, say from $100 up, so that people could buy, the settler in turn to bond his land to the county for a given sum per acre, to be set by a commission appointed by the county board or the governor of the state and the money to be paid to the settler when proof is presented to the county treasurer that the land is under the plow. If some such plan as this could be carried out it would work wonders and no doubt in our time we would see this whole country developed into the most beautiful country the sun shone on. J. K. Flynn.

Douglas Co., Wisconsin.

DANISH BROTHERS SUCCEED IN UPPER WISCONSIN.

To the Editor:—A few years ago three Danish brothers came to Wisconsin. There is nothing remarkable in that fact—thousands of Danes had come to Wisconsin before and most of them made good, both in city and country. But these Danes did better than many of their countrymen who have come in recent years. They did not go to the city as has been the more recent habit of foreigners who come to Uncle Sam's domain. They went to the country—to the best new country they could find, i. e., to Upper Wisconsin.

Two of these Danish brothers—Nils and Mangus Christianson—bought 280 acres of land, an amount that usually is thought to be too much. But Henry Peterson, of the Superior Telegram, who recently visited the Christiansons, says that they have 180 acres under the plow—fifty of which was cleared in 1915; that they have a fine home and a magnificent barn in which they care for more than fifty head of cattle, thirty of which are milk cows.

The other brother bought 160 acres, and, although he began two years ago, has fifty acres improved and good buildings and is caring for twenty-nine head of stock.

These men might have worked all their lives in the old country or in cities of this country, and in the end have half what they already accomplished in Upper Wisconsin. Their homes near Wentworth, Douglas county, are looked upon as striking examples of what can be accomplished in Upper Wisconsin.

But, passing what this means to the Christiansons, what does it mean to the community and to the state? The trading and banking center of that portion of the state is Superior, a giant young city. Superior needs food supplies grown in the locality—imported foodstuffs never properly supplied a city. It needs trade and deposits of the farmers who are starting in its territory. The county needs the taxes these men and others will pay in the future. And their prosperity will make them cheerful taxpayers.

These men will be contributors to the state exchequer and they will be too busy marketing dairy products to take much interest in the number of inspectors there may be in the various police bureaus of the state. They will help build up a new community and they will contribute to the business of the railroads so the state may tax them a little more.

In fact, it is such people that make a state rich and prosperous and famous. And yet there are politicians who will say that state development is not a political question, just as the bankers' question. But that time is passing. Some time a real statesman will make it a state issue—and win.

But the great point is that what the Christiansons have done to Wentworth thousands of others have done all over Upper Wisconsin and tens of thousands more will do in the next ten years.

They will build up great communities, enriching themselves, their communities, counties and the state. Instead of having a few thousand and more milk cows than any other state, we will have twice as many and better ones, for no people anywhere are so anxious for better stock as those of Upper Wisconsin. In that new country there is a higher percentage of improved stock than in any other portion of the middle West. The greatest market for the better stock of the older counties is in Upper Wisconsin.

It is but a short time ago that the agricultural merits of Upper Wisconsin were discovered. It was thought of and talked about as a wilderness that would be useless when the timber was removed—in fact, it was supposed that most of the timber was pine instead of hardwood, as is the case.

A. D. Campbell,
Manager Wisconsin Advancement Association.

THE MOTOR CAR IN WINTER.

(Continued from page 6.)

is torn in the tread, clean the place with gasoline, fill the hole with rubber and vulcanize with a 275 degree heat for twenty minutes. Small places, fixed while they are yet small, postpone the coming of larger ones.

As cold weather comes you find starting is harder. Just because your car is equipped with a self-starter, is no reason for prolonging its use when a little priming will help it to a quicker start. I have seen motorists keep their starter going for four and five minutes to secure a start that could be secured by a mere push after priming. An extravagant use of the starter means a quickly drained storage battery. Better prime and make the starting easy than to always be up against the bother and expense of weak batteries. Unless your battery is fully charged it is a good plan, in very cold weather, to disconnect and take it to the cellar or some place where it will not freeze. A badly run-down battery freezes, and if very hard, the plates may be warped and the jars broken. It is a good plan to go into the winter with a fully charged battery.

On a very cold morning priming alone may not be sufficient to secure an easy start. Have a teakettle filled with hot water, and rather than to abuse your self-starter by a long-continued use of it or sprain your back by twisting at the crank, warm the carburetor and the gasoline that is in it by dousing with the hot water. If there is a small vent leading into the bowl of your carburetor—if you'll hunt for it you'll probably find one—stick a small splinter or a toothpick into it before dousing on the water or some of it will surely get in with the gasoline, then you'll sure enough have fun in getting started. When started be sure to pull out the splinter, for the vent is there for a purpose and must not be stopped. You will be surprised at the new life a carburetor that has just received a warm bath will give to a cold motor. If you do not use an anti-freeze solution in your radiator, filling with warmed water also means an easier start, and less "warming up" necessary after starting, but be sure your water is not too hot when the motor is cold. Cylinder jackets have been cracked when very cold by the sudden contact of very warm water.

Many motors require a heavier oil for summer than for winter. To continue on into the winter with the heavy oil may mean trouble, as the heavy oil will not flow fast enough to thoroughly lubricate all the bearings. If in doubt, better change to a lighter oil, as it is better to use a little too much oil than not enough, for oil is cheaper than new bearings and a much too generous sized bill for making the replacement. I also like to use a thin transmission grease during the cold months. A thick grease gets so hard in cold weather that the gears only cut paths through it, and soon are running with insufficient lubrication. Use grease thin enough to flow upon being churned in any temperature that the car will be used.

With the windshield tight, the top up and curtains well fitted, a motor car is a warmer means of travel than anything else on the farm. Time was when motor cars were underpowered, and users hesitated about putting on the curtains, especially if going against a hard wind, but nowadays, if a motor car lacks power it is because it is out of trim or is in the hands of a poor driver, so tops and curtains and windshields are not sparingly used. The heat of the motor keeps the floor of the car warmed, and those in the front seat get heat enough so a robe is seldom necessary if all curtains are on. The idea that a motor car is a cold thing in which to ride dates back to the time when it was the custom to "take the wind," with the top down and perhaps no doors to protect the front. From a thing of pleasure, purchased only by the rich and used only when the days were warm, the motor car has become a practical means of conveyance considered almost a necessity by thousands of farmers, who make almost daily use of it, regardless of heat or cold, just so the roads permit. There is no "closed season" for the motor car owned by a farmer. —[Henry Hatch.

"Made on the Farm"

One of the extensive Hawthorn Dairy Farms in Illinois — Sam'l L. Insull, Prop.

Hawthorn Farm
Lake County, Ill.

December 25, 1915

Arcady Farms, Lake Forest, Illinois

Dear Sirs:
Your letter of the 21st inst. has been received and contents noted. We would have liked very much to have placed an order for 5 cars of Arcady feed at this time if we had not lost our dairy herd. We used 5 cars of Arcady feed last Winter and we think it is the best and cheapest feed and the best milk producing feed that we have ever been able to buy.

Yours truly,
Andrew Efinger.

Cut Down Your Dairy Feed Bills

Do as such dairy farmers as J. A. & W. W. Watson of Youngstown, Ohio—Knollwood Farm, Granger Farwell, Prop., Lake Forest, Ill.—Mariondale Farm, Grover Kull, Prop., Geneva Junction, Wis.—and scores upon scores of other money-making dairy farmers have done—use R K D Dairy Feeds. They have learned by experience that the use of

R K D
DAIRY FEEDS

is *economical*—that it *increases* milk yields—that it fattens their dairy profits. And they have found that their use actually does *cut down* the cost *of dairy feed.*

What's more, they know that in spite of the increase in the milk yield it brings, feeding R K D to the herd *keeps the cows in excellent flesh*—in top notch condition.

Write us for *complete evidence* of the superior value of RKD Dairy Feeds. *Ask your dealer* to supply you. If he cannot, write us direct.

Arcady Farms Milling Co., Box 55, Rondout, Illinois

FINE FARMS IN LANGLADE.

This Upper Wisconsin County, Only a Few Years Ago Covered With Stumps and Second Growth Timber, Is Setting a Fast Pace in Agricultural Development—Many New Barns, Silos and Homes.

PROBABLY no county in Wisconsin is showing a more rapid development in an agricultural sense than Langlade county. Although there are only 1,450 farms in the county and less than a tenth of the tillable soil has been developed into farms, this county is setting a pace that is the equal almost of any community, not only in Upper Wisconsin but in the state as a whole.

During the past summer more than sixty new barns of the most modern type were erected in the county. Silo construction has also been at its height, as about forty new silos were built during the summer. Had the corn situation been more favorable at least 50 per cent more silos would have gone up, as this was the first time in many years that Langlade county has failed to secure a good corn crop. More than forty barns were equipped during the past season with the most modern equipment on the market and scores of new farm homes were erected.

Where one finds new barns, new homes, silos, etc., under construction and old as well as new barns being equipped with modern equipment it is certainly a sign of prosperity. Considering that only a few years ago Langlade county was in the hands of the loggers and the lumber jacks it certainly is a testimonial to its adaptability to farming to see such fine farm buildings and fine herds and flocks which the writer had the pleasure to view recently in an automobile trip through the county with Mr. F. G. Swoboda, county agricultural representative.

Great work is being accomplished in the county by the county agricultural representative, the county superintendent of schools and others interested in opening up Langlade county to farms. The day of the scrub sire has almost passed and in his place are pure-bred bulls and stallions. There are also many pure-bred swine herds, a few beef cattle and sheep, but as the future of the county, like most of the other upper counties, lies in the development of dairying this class of live stock farming predominates. Mr. Swoboda estimates that there are now seventy-five pure-bred Holstein sires in the county in addition to twenty pure-bred Jersey sires and fifteen pure-bred Guernsey sires. Very seldom does one hear any more of a scrub sire in this community, as the farmers have learned the value of good blood and are seeking the very best when breeding.

Great stress is being laid constantly on the value of profitable live stock and with thirteen cheese factories and six creameries in the county to take the product of the cows dairying is becoming more and more popular as well as more profitable. The cow-testing association is doing excellent work and in addition many farmers who are unable to join the association because of being too distant are weighing their milk and having it tested at one of the near-by rural schools or by the county representative. There is that desire among the farmers that means a better agriculture—a desire to do those things which will increase their profits. No doubt much of this desire has been created by the extension work being carried on in the county and too much credit cannot be given Mr. Swoboda for the splendid work he has been carrying on during the past two years. Mr. Swoboda takes a great personal interest in his work. He went to Langlade county after several years of farming in Waukesha county and he carried with him much of the enthusiasm that has made that a great dairying community.

Potato growing is one of the big farming operations of the county, although some wonderful grains are grown. John C. Johnson, of Antigo, threshed 950 bushels of oats this year off nine acres, while sixty-five bushels, machine measure, is very common. Another farmer threshed 3,800 bushels of oats from forty-five acres, while barley runs from forty to fifty-five bushels. Clover that runs five tons to the acre for two cuttings is not uncommon, while the spring wheat crop this year was very good, some running thirty bushels to the acre. It is an exceptional year that corn does not ripen and there is almost always plenty for the silos. Considerable attention has been paid to alfalfa by Mr. Swoboda, there being about fifty acres this fall. This runs about a ton better to the acre than clover. Of potatoes the Rurals lead in acreage with the Triumphs and Cobblers next and this year seven farmers grew certified potato seed.

Alton Follstad, of Elcho, vice president of the Wisconsin Potato Growers' Association, has one of the fine pure-bred Guernsey herds in the county. Other good Guernsey herds are found on the farms of Walter and Henry Head, of Antigo; Anton Greisinger, of Bryant; Charles Metcalf and others. These are only a few of the fine Guernsey herds in the county and these are all being built up to a higher standard each year by using pure-bred sires.

Considerable attention has been given to the advantage of stable-raised calves and those of the Head farm shown at the county fair this fall certainly proved it worth while to raise them indoors in this community.

The dairymen are all organized, there being a Holstein, Jersey and Guernsey breeders' association and these organizations are doing much to encourage better dairying. Blaine Stewart, of Antigo, who is president of the Jersey breeders, has a pure-bred herd from which he has supplied many of the pure-bred Jerseys in the county, as he was the original Jersey breeder. Among the Holstein breeders are two brothers, Alois Stengl and Joseph Stengl, of Antigo, who are

FEW OF MR. METCALF'S PURE-BRED PERCHERONS.

ONE SILO NOT ENOUGH IN LANGLADE COUNTY.
(Farm buildings of William Heckman, Antigo.)

BARN RAISED CALVES OF WALTER HEAD, ANTIGO.

having fine success at farming. Alois Stengl is now building a new barn which will rank with the best, while his brother has just completed a fine, modern barn.

Although there are some fine swine in the county, this side of live stock farming has not had the attention that dairying has had. Lawrence Guenthner and Charles Parsons, of Antigo,

SWEEPSTAKE BULL AT 1914 COUNTY FAIR. OWNED BY GRESCH BROS.

both have pure-bred herds of Poland Chinas, while Charles Lade, of Polar, and John Smith, of Kent, had pure-bred Duroc Jerseys. These two breeds predominate and the success of these breeders indicates a growing swine industry.

Langlade county is also strong in good horses and has ideal conditions for horse breeding. There are ten pure-bred stallions in the county, against five grades and four scrubs. This percentage of pure breds and scrubs is much better than many older communities. Seven of these ten pure breds are Percherons and three are Standard bred. Percheron owners are Henry Boettcher, Antigo; H. A. and P. S. Carley, of Elmhurst; E. P. Hoeft, of Ormsby; Charles Metcalf, A. J. Rolo, J. W. Prosser and Jacob Price, all of Antigo. Standard bred owners are J. V. Bassett, of Antigo; John Groth, of Polar, and F. K. Voss, of Antigo.

Langlade county farmers, with the aid of Mr. Swoboda, are interested in numerous activities which will lead to more profits. These include everything from experiments with commercial fertilizer to experiments with alfalfa, etc., the holding of short courses, farmers' meetings, etc. Other activities include the promotion of interest in the use of pure-bred sires, proper care of new-born foals, better raising of calves, regular weighing and testing of milk, fighting noxious weeds, better ventilation of stables, testing of skim milk to determine whether separators are working properly, keeping a system of farm accounts, planting pure varieties of potatoes, regular use of road drag, value of sweet clover, alfalfa and soy beans as valuable crops, the value and importance of the silo, crop rotation, system, etc.

This interest among the farmers will show up in the future in Langlade county with increased returns per farm and is a sure sign that this county will be heard from in the future.

Talk Seed Corn in Polk County.

Splendid Work Along Agricultural Lines Is Being Done at the Osceola High School---Corn Show Held in December.

GOOD seed corn was the principal feature of the Second Annual Corn Show and Agricultural Exhibit of the Osceola, Polk county, High School, held in the town hall in December. Ideal weather brought out a good crowd of farmers and townspeople to see the exhibits and to listen to the program. In the forenoon John Klinka, county representative for Polk county, and Frank D. Otis, of Barron, judged the products and placed the awards. The winners were:

CORN.

50-Ear Contest—1st James Hanson; 2d Edd Lundburg; 3d C. E. Swanson.
10-Ear Contest—1st H. Nanson; 2d P. Duff; 3d O. A. Swanson.
1-Ear Contest—1st Paul Duff; 2d Ed Lundberg; 3d Leon Dohm.

POTATOES.

5-Potato Contest—1st Howard Combackeo, Russets; 2d Herman Hanson, Rurals; 3d Joe Nagler, Green Mountains.
Bushel Contest—1st E. Wurst, Green Mountains; 2d H. Brocker, Rurals; 3d L. Dohm, Burbanks.
Barley—1st Irving Newton; 2d Carl Nagler; 3d E. Wurst.
Oats—1st E. Wurst; 2d Dr. Mitchell; 3d E. Seemann.

A sauerkraut dinner was served at noon by the agricultural class, and furnished a splendid lesson in skillful marketing. This fall they had in their school garden a quantity of cabbage for which they had no market. Instead of allowing it to go to waste, they made it into sauerkraut under the direction of their agricultural teacher, Mr. E. Vernon Miller. The sauerkraut dinner followed, was patronized by 150 people at 25c a plate.

In the afternoon Mr. Klinka spoke of the dirth of good seed corn threatened for next spring, and urged that Polk county seed be reserved for Polk county farmers. He then reviewed the work of the judges, emphasizing the importance of selecting mature samples that conform to standard type, that are uniform in size and shape, and that are free from disease.

Frank D. Otis, Barron, followed in a talk upon "Successful Corn-Growing." He said that next year's corn crop depends upon this year's seed, and advised fire drying the seed in a well-ventilated room. Fall plowed clover sod worked as early in the spring as possible gives best results. The early cultivation breaks up the winter crust and prevents evaporation with consequent earlier warming up of the soil. This promotes more rapid germination of the weed seeds and later cultivations kill many of them before the corn is planted. It was especially brought out in the discussion that frequent cultivation after the corn is planted and continued until the corn is too large, deep at first and shallower as the corn grows, is of vital importance, and may be the deciding factor in the success of the crop.

Too much commendation cannot be given to Prin. Martin Anderson and his agricultural assistant, E. Vernon Miller, for their successful management of the entire program.

POTATO AWARDS IN MINNESOTA.

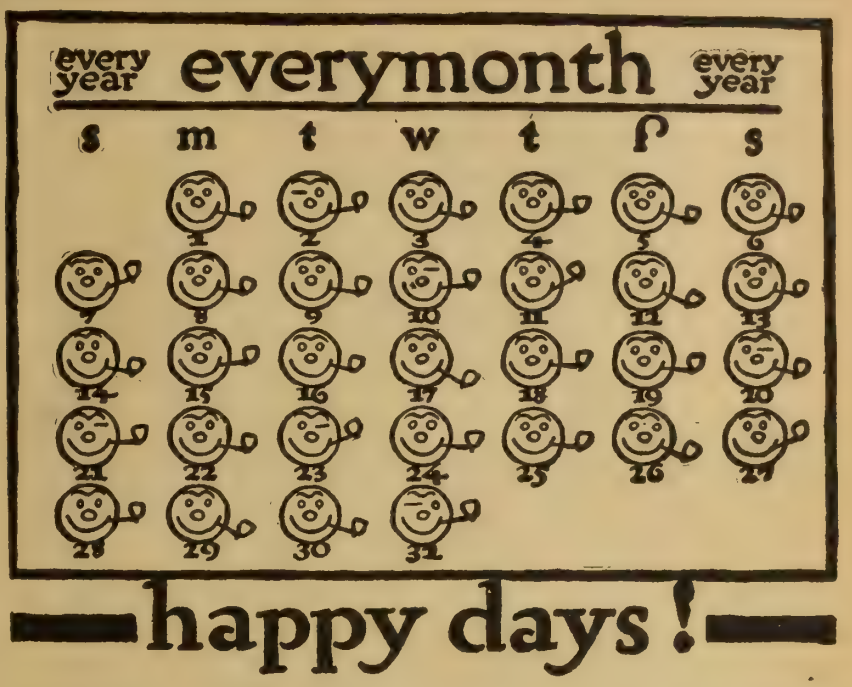
Final awards have been made in northern Minnesota boys' and girls' potato contests promoted by the Northern Minnesota Development Association, and carried on under the direction of the extension division of the Minnesota College of Agriculture.

Oscar Larson, of Viking, Marshall county, won the championship, as grower of Green Mountain potatoes and made something of a record, obtaining 75 2-3 bushels from one-eighth of an acre. This is at the rate of 605 1-3 bushels to the acre. Audrey Howe, of Merrifield, Crow Wing county, was second with a yield of at the rate of 406.8 bushels to the acre. Robert Lessard, of Grand Rapids, Itasca county, was third with 410.64 bushels to the acre, and Allen Strand, of Sawyer, Carlton county, was fourth with a yield of 360 bushels to the acre.

Both the first and second prizes in the Rural New Yorkers class were taken by girls—Elizabeth Tofte, of Tofte, Cook county, was first with a yield at the rate of 504 bushels to the acre, and Ruth Enstrom, Carlton, Carlton county, was second with a yield of 378.96 bushels to the acre. Frithiof Anderson, Moose Lake, Carlton county, came third with a yield of 388¾ bushels to the acre, and Martin Kateranta, of Sawyer, Carlton county, was awarded fourth prize with a yield of 384 bushels to the acre.

The cost of production has not been worked out in all cases, but Oscar Larson, at Viking, produced his 75 2-3 bushels at a total cost of 12 cents to the bushel. Robert Lessard, of Grand Rapids, did still better with a cost of 10 cents per bushel. Elizabeth Tofte's cost rate was 18 cents, and Ruth Enstrom's, 11 cents. Martin Kateranta reduced his cost almost to a minimum at 5 cents a bushel.

The club prizes were awarded as follows: First, Grand Rapids, Boys' and Girls' Club, Itasca county; second, Mission Club, Crow Wing county; third, Boys' and Girls' Club, of Embarrass, St. Louis county; fourth, Boys and Girls' Club of Ray, Koochiching county.



happy days!

"Tux" is the happy smoke. It just packs the smoker's calendar so plumb full of fragrant delight that a gloomy day can't crowd itself in edgewise. That mild, soothing taste of "Tux" has introduced many a man to the joy of pipe-smoking and a regular unending procession of happy days.

Tuxedo

The Perfect Tobacco for Pipe and Cigarette

By far the most pleasant pipe-smoke in the world is Tuxedo. Think of the supreme satisfaction of being able to smoke your pipe all day, and day after day, without a particle of discomfort! You can do it with Tuxedo—because Tuxedo is made wonderfully mild and absolutely biteless by the *original* "Tuxedo Process."

That process is what makes Tuxedo different from any other tobacco made. Others have tried to imitate it, but never successfully. Just try Tuxedo for a week and you'll smoke it ever after.

THE AMERICAN TOBACCO COMPANY

Kirstin ONE-MAN STUMP PULLER
Makes Land Clearing Easy, Economical, Practical

You can't realize the wonderful *strength, speed and power* of the new Double Leverage Model Kirstin until you see one at work. Compound leverage gives any man the strength of a giant—enables him to quickly pull biggest stumps with ease. The Kirstin way is quickest, easiest and cheapest way to clear stump land. No heavy cumbersome machines to pull around, tip over or get stuck in boggy places. No sweeps to break, no horses to risk, no dynamite, no danger. With a Kirstin you simply walk into your stump field and "clean it up" in no time at all. You can

Try The KIRSTIN For Ten Days

Used Anywhere—Hills, Swamps, Rough Ground or Thick Timber.

Prove to yourself that it clears your land cheaper. Let the Kirstin's superior features demonstrate their value right on your own farm. Less weight—greater strength—lower cost—greater speed—all these valuable qualities are made possible by the Kirstin Quick-Detachable Connections, Auto Release, Non-Twisting Cable and other Kirstin patented features.

Write Today For The Big New Kirstin Catalog

which gives you full details about the Improved Double Leverage Kirstin One-Man Stump Pullers, Kirstin Service, Free Information Bureau, Time Payment Plans, etc. *Agents Wanted.*

DAIRY

MILK PLANT SANITATION.

There are some details in milk-plant sanitation which are not given on any scorecard. If the floors, walls and ceiling are smooth and are made of sound and durable materials they may be easily kept free from dirt and dust. Concrete floors are very satisfactory, for they can be flushed often with water, there is no danger of rotting and if properly constructed there will be no cracks in which dirt can collect. Iron plates laid in cement are sanitary and are more durable than concrete.

A separate room for handling the milk apart from all other operations is essential and all doors must be kept closed to exclude flies and impure air. It is better to provide pure air by means of a modern system of ventilation. Even when the air is pure the vats, pasteurizers, coolers, fillers and other apparatus should be covered to prevent all unnecessary contact with the air.

The milk must be kept cool after it is received at the plant and not be allowed to stand long before bottling. If not used at once the cans should be put into a refrigerator or the milk stored in tanks made for this purpose. These tanks must be in a cool place or be surrounded with a jacket of ice water or brine. Strainers of cheesecloth are more satisfactory and more easily cleaned than those of wire gauze, but the use of strainers of any kind should be avoided as much as possible. Some dealers strain the milk after it is pasteurized before it is run into the filler. This may increase the bacterial count, and, furthermore, is unnecessary if the milk is properly clarified or filtered before pasteurizing and if the apparatus is clean.

A filter of cheesecloth and cotton, if used, must be changed several times during the day. The cheesecloth must be washed, sterilized and kept where the air is pure. It can be used a few days before throwing away, but the cotton, of course, should be used only once. As soon as the milk is put up all parts of the apparatus should be thoroughly cleaned by first rinsing in cool water, then washing with hot water to which washing powder has been added, and finally sterilizing with boiling water or steam. The pumps and pipes can be rinsed by pumping water through them immediately after using. They must then be taken down and thoroughly washed. This can easily be done if there are several couplings in the pipes. All joints and couplings must be kept tight and free from dirt, rust and corrosion. Battered and rusty apparatus or cans afford good lodging places for bacteria, and, being hard to clean, should not be used.

The pasteurizer is one of the most difficult pieces of machinery to keep clean, as the milk sometimes sticks to the sides and, if not properly cleaned, a cooked layer forms on the inside, which grows worse each day. The dairy division of the government bureau of animal industry will send a score card upon request.

SELLING COWS ON THEIR MERITS.

A dairy cow's real value depends upon her ability to make good at the milk pail. Her yields of milk or butter fat constitute the real test of her ability to make money for her owner. Men who purchase cows are learning to require that cows have an established record of performance. Buyers will pay a handsome premium for cows whose records are creditable. This is true of grade cows wanted for the farm dairy. It is even more true of pure-bred stock wanted for breeding purposes. The story has been recently related that a cow which had been secured for a very ordinary price was put on record. Her records show a very remarkable production. Later she was again offered at auction, at which sale she sold for $2,400 more than she had sold for before records had been kept on her. One of the cows which held a world record for a time sold for a very small price before she showed to the world that she was one of the greatest cows of her time.

Cows with records can be sold strictly according to their merits. Without records cows are unknown quantities. Certain things go to back up a cow's record. They are dairy type and breed. Type alone, although the cows have the five essential points to a marked degree does not prove the dairy cow. Breeding of itself is not sufficient. Pure-bred cows in some instances have been failures as producers. Yet the heavy producers will be found in cows possessing dairy characteristics and they will be found in cows which are pure bred or which have a strong percentage of dairy blood.

The man who knows his cows and who can give a statement with the sale of each showing what she has been doing for him and indicating what she will do in the future certainly will reap better prices.

CLOSING EXERCISES AND BANQUET.

To the Editor:—On January 27, 1916, the 162 winter dairy course students of the University of Wisconsin will hold their annual banquet.

This will be the closing exercise of the three months' course. Many pleasant acquaintances have been made among the buttermakers and cheesemakers this year and while this banquet is going to be a jolly good time it is something like "breaking home ties" to stop the daily routine at the end of school and start out in 162 directions to creameries and cheese factories in which these men expect to work.

All former students and friends are cordially invited to come to Madison on January 27, 1916, to attend the closing exercises of the winter dairy course and the evening banquet.

E. H. Farrington.
Wisconsin Dairy School.

WISCONSIN BUTTERMAKERS, ATTTENTION.

To the Editor: — The Fifteenth annual meeting of the Wisconsin Buttermakers' Association will be held at Eau Claire, February 1, 2 and 3, 1916. Notices concerning this convention will be forthcoming in succeeding issues of the dairy press.

We are pleased to announce at this time that Santa Claus was very good to our association this year. Several firms have notified us that they will contribute to our premium fund.

The H. C. Christians Company, Johnson Creek, buyers of large quantities of butter will contribute $10,000 to this fund.

The Diamond Crystal Salt Company, St. Clair, Mich., and the Worcester Salt Company, Chicago, each contribute $10, and we have also been informed that the Clifford L. Niles Company, Anamosa, Iowa, manufacturers of cream aerators and blowers will contribute $10 to the premium fund.

These contributions are particularly acceptable in view of the fact that we do not receive any financial aid from the city of Eau Claire such as we have received from cities in the past.

We have many side contributions. Of course, our boys will be pleased to learn that Hon. S. A. Cook, of Neenah, will again give four nice leather chairs for the best four pieces of butter exhibited. Hon. Cook was not even approached concerning the chairs but came forward of his own free will, which shows his deep interest in the cause of dairying in Wisconsin. We know that the boys appreciate his good will and no doubt will be greatly stimulated to produce better butter on account of the prizes he offers every year.

The Two Rivers Plating Works, Two Rivers, Wis., offer $5 worth of work to the creamery whose buttermaker gets the best score at the convention.

We are also pleased to announce that the J. B. Ford Company, Wyandotte, Mich., have again offered ten district prizes as they have so generously done in the past. The prizes this year will be sets of military brushes, and parties who have seen them pronounce them to be of exceptional quality.

Another contributor to our premiums is the Hon. Geo. J. Weigle, dairy and food commissioner, who offers a handsome silver cup to the party receiving the highest score at the convention. The deep interest that he is showing in the improvement of the dairy industry in this state is evidenced by the fact that Mr. Weigle of his own volition comes forward and offers this prize to help the boys along in the good work.

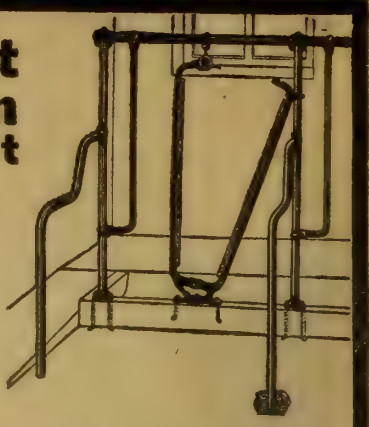
The officers of the association are very grateful to these many donors and we know the members appreciate their good will.

G. H. Benkendort.

CALF RENNETS WORTH SAVING.

There are probably over 100,000 calves killed in Wisconsin, on the farm and by local butchers, each year, and if the rennets were all saved they would represent a value of about $10,000. They bring now about 10 cents each on the market and can easily be sold to manufacturers of rennet extract. Many farmers, of course, kill only very few calves, so it might not pay them to handle the rennets, but

JAMES Equipment In a Good Barn Means Cow Comfort —Bigger Profits



HERE'S a typical JAMES stall, a JAMES designed barn, and JAMES Sanitary Barn Equipment in actual use—a combination that will save labor and make more money for any dairyman.

This $4.75 stall has the same steel piping and square horizontal pipe, dust-proof fittings, Triple Curve Stall Partitions; same heavy galvanized stanchion anchors; same system of anchors for quick, easy erection; same JAMES stanchion, cow-proof lock door-knob type, lock open clip, everlasting hinge, double chain hanger with flat links, wood lining; same baked-on enamel finish; same system of shipping assembled; same style and durability found in JAMES complete feature-equipped stalls. It is the JAMES $10 stall without some of the special features.

JAMES Barn Plan Service will help you wonderfully in building or remodeling. It starts you *right.*

JAMES equipment, designed and built by the originators of sanitary barn equipment ideas, includes Stalls, Stanchions, Pens, Carriers, Ventilators, Watering Buckets, etc. Stall prices range from $4 to $10, depending on number of special features wanted. Quality, finish and system of inspection the same in *all* JAMES equipment.

Tell us how many cows you own and when you expect to build or remodel and receive copy of JAMESWAY Book—FREE.

Why Aluminum Discs?

EVERY woman knows that its much easier to wash and thoroughly clean aluminum cooking utensils. Grease does not stick to aluminum. ***Just one reason*** why we use aluminum skimming discs in the SANITARY MILWAUKEE CREAM SEPARATOR. ***Another reason:*** Aluminum discs do not rust or corrode like the tinned steel discs of other separators. ***Still another reason:*** Using aluminum enables us to *taper* MILWAUKEE discs—a process too costly—too intricate to attempt in steel discs. Tapering the discs, gives much greater separating capacity between each set; hence the MILWAUKEE requires only about half the number of discs used in other separators, to accomplish even quicker, closer skimming.

SANITARY *Milwaukee* CREAM SEPARATOR

discs are also interchangeable. No tedious work placing them in the bowl in proper rotation like numbered discs. Just slip them back in any order. Every MILWAUKEE is tested with fresh milk, before it passes our inspectors. You get a certificate of this test; also iron-clad guarantee, doubly protecting you when you buy.

Illustrated catalogue and name of MILWAUKEE dealer nearest you, are yours for the asking.

HOMESTEAD COMPANY
Engraving Dept. Des Moines, Iowa

they would no doubt be glad to give them to some enterprising boy in the neighborhood who could collect them from several farmers.

It takes very little time to handle rennets, as all that is necessary is to squeeze out the contents, slit them open and then salt well on both sides. A couple of inches of the narrow end (the neck) is generally cut off and the fat should be removed. If the rennets should dry out after they are salted it will do no harm; in fact, they will keep longer if dried, but there is very little danger of getting the salted rennets spoiled as long as they are kept cool.

BUTTER OVERRUN.

The terms "butter" and "butter fat" are always confusing to one who does not understand the meaning of each one. Butter fat is the pure fat or oil found in milk and its products and is the chief constituent of butter, as shown in the following:

AVERAGE COMPOSITION OF BUTTER.

Fat	84 per cent
Water	12.73 per cent
Curd	1.3 per cent
Salt and ash	1.97 per cent

In studying the above analysis it is obvious that "butter" and "butter fat" are not one and the same thing, and that when cream containing a pound of butter fat is churned more than a pound of butter will be made. Ordinarily we say that one pound of butter fat will make one and one-sixth pounds of butter. This one-sixth of a pound is termed surplus or overrun. The amount of overrun obtainable from a certain amount of cream containing a certain per cent of butter fat depends on the amount of butter fat lost during churning due to spilling of cream, loss of fat in the buttermilk, etc., and to the amount of water, curd and salt which the butter is made to contain. Two per cent salt in butter usually suits the trade. The curd content is always about 1 per cent. This leaves the moisture content as the factor which can vary and which largely determines the overrun. The law allows 15.9 per cent moisture in butter.

The buttermaker depends largely upon the overrun to pay running expenses and his profit.

The pounds overrun is found by subtracting the amount of butter fat which went to make a batch of butter from the butter itself. The per cent of overrun is found by dividing the pounds overrun by the pounds butter fat which went into making the butter.

Problem I. Forty pounds of cream, testing 30 per cent butter fat made 14½ pounds of butter. Find the overrun and per cent overrun.

40 times 30 equals 12 pounds butter fat in 40 pounds 30 per cent cream.

14.5 minus 12 equals 2.5 pounds overrun.

2.5 divided 12 equals 20.8 per cent overrun.

Problem II. A proprietary creamery makes in one year 500,000 pounds of butter, securing an average overrun of 20 per cent. An average price of 38 cents per pound is paid for butter fat, and the butter is sold for 38 cents per pound. Did the overrun yield the owner any profit; if so, how much?

500,000 times .20 equals 100,000 pounds overrun.

500,000 minus 100,000 equals 400,000 pounds butter fat bought.

400,000 times $.38 equals $152,000 paid for fat.

500,000 times $.06 equals $30,000, cost of making.

$152,000 plus $30,000 equals $182,000, total expense.

500,000 times $.38 equals $190,000, receipts from butter.

$190,000 minus $182,000 equals $8,000, profit to owner.—[H. F. Judkins.

RIVER FALLS REPORT.

Thirty-six cows in the River Falls and Roberts Cow-Testing Association made the forty-pound list during November, the report of P. B. Van Horne having just been made public. First honors for butter fat production went to a Holstein in the herd of D. E. Fowler with 67.4 pounds. The report follows:

Owner, name and breed	Age	When fresh 1915	Lbs. milk	Per cent fat	Lbs. B. fat
Alton Bros.

NETTLE HILL REPORT.

The following table gives the names of the cows in the Nettle Hill Cow-Testing Association which have produced more than forty pounds of butter fat or 787 pounds of milk during the period of thirty days ending October 31, 1915:

Owner and breed	Age	Lbs. milk	Per cent fat	Lbs. B. fat
Phil Sickinger				
Native	11	784	4.3	42.3
P. S. Cahill				
G. Holstein	6	946	4.3	40.7
G. Holstein	8	940	4.4	41.4
G. Holstein	9	978	4.3	42.0
G. Holstein	7	970	4.9	47.5
G. Holstein	7	971	5.1	49.5
W. H. Connell & Sons				
G. Holstein	5	787	5.1	41.7
Theo. Pritzel				
G. Holstein	3	1240	4.3	53.3
John Pritzel				
G. Guernsey	5	953	5.6	53.4

Manford D. Pease, Official Tester.
Geo. W. Kiel, Secretary.

The agricultural instructor at Browns Valley, Minnesota, did much to make his town a better place in which to live by conducting a lawn contest and encouraging the setting out of street trees. The commercial club furnished the trees, the agricultural class boys staked the streets. Some 500 trees were set. The boys also cleared up the park and it was afterward kept in shape by the Boy Scouts.

Touching Poultry Problems.

Well-Known Farmers and Poultry Breeders Contribute to Wisconsin Farmer Symposium on Important Subject of Interest to Raisers.

Editor's Note:—These letters from well-known poultry breeders and farmers of Wisconsin continue a series which has been running in The Wisconsin Farmer for several weeks and will continue for some time. Important subjects open for discussion in these letters are:

Ration for winter egg production.

Preventives and cures of mites and lice.

Handling of roup.

Open air housing.

How shall we get rid of the stale egg?.

Other poultry raisers are invited to contribute, send in photographs, etc. The subjects suggested here may be chosen, or other problems which come up in everyday experience may be discussed. Address, Wisconsin Farmer, Madison, Wis. Please mark all pictures plainly with name and postoffice address on the back so they may be returned.

WILLIAM WICHERN, PLOWING UNDER CLOVER FOR POTATOES.

ISOLATION FOR ROUP VICTIMS.

To the Editor:—My method of feeding hens for winter egg production is as follows: In the morning they have oats scattered in a litter of alfalfa leaves and straw; at noon, two or three times a week, a warm mash consisting of boiled potatoes and peelings mixed up with a ground feed of oats and corn. A little salt is usually added to the mash. When they do not have the mash they are fed wheat. At night a feed of corn is usually given.

One hopper contains grit and oyster shells and another a dry mash consisting of bran, middlings, oil meal, beef scrap, corn meal and ground oats. Any of the standard dry mash formulas will do for this.

Every morning mangel wurzels are cut in halves and stuck onto spikes.

A LA CROSSE WINNER.
Second Rhode Island Red cockerel at La Crosse, 1914, owned by William Wichern.

The hens like these and eat all but the shell.

A dust box is placed in a sunny place and charcoal is given occasionally. Fresh water is supplied two or three times a day.

This care, of course, means considerable work, but the results justify the trouble.

In regard to housing, I was at one time an open front advocate, but after having some of my choicest cockerels freeze their combs I decided that in our rigorous climate one must suit the house to weather conditions. I now have part of the windows with glass panes for the sake of sunshine and part are fitted with muslin-covered frames with hinges, so that I can give the birds air through the cloth windows when the weather is severe. At other times the cloth frames are hooked back and the house is then practically open front.

Lice and mites, I am glad to say, are the least of my troubles. When I use hens for incubating I always keep them well dusted with insect powder, and, if necessary, I use a little powder or sweet oil on the little chicks, but after the chicks are once feathered out they always have easy access to dust baths and keep themselves free from lice.

In the past I have had my troubles

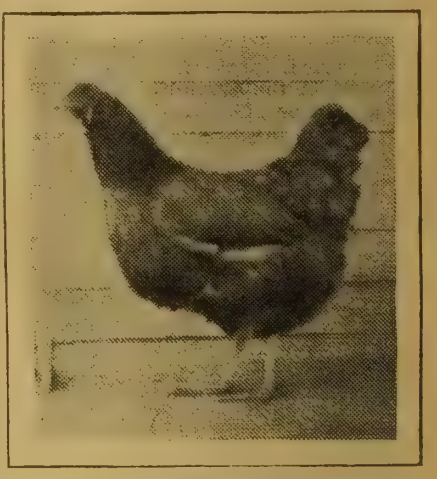
PRIZE WINNER AND MASTER.
On the William Wichern farm, Sauk county, Wis.

with the mites, but haven't seen one for several years. Every spring, with an old paint brush I go over the roosts and other fixtures with a preparation called carbolineum roost paint. This mixture seems to be quite discouraging to the mites, for they never show up where I use it.

I seldom have a case of real roup, but here, as in other things, prevention is better than cure. If the birds are not overcrowded and have all the fresh air and exercise they need they are not apt to be troubled with roup, but if a bird that is not especially valuable contracts this disease the safest and easiest method is to get rid of it at once. However, I have cured several valuable birds in the following manner: I place the bird by itself in a house that is airy, but not too cold, and frequently inject peroxide diluted with water into the eyes and nostrils. Soft, nourishing food is given and a little permanganate of potassium in the drinking water.

I once cured a bird in this way that had both eyes swelled shut so I had to feed and water it by hand in order to keep it from starving. But this treatment requires time and patience and, as I said before, unless the bird is an especially valuable one, I usually get rid of it at once.

In regard to the sale of decayed eggs, nothing has been done in this locality to prevent it, but I believe that reading the farm and poultry papers, the farmers are gradually becoming educated as to the desirability of selling only strictly fresh eggs.



IN FIRST PEN.
Rhode Island Red pullet in first pen at La Crosse Poultry Show, last winter.

Personally, we never send out an uncertain egg, but put such by themselves and try them, using the good ourselves and discarding the rest.

As long as the same price is paid for fresh eggs, cold storage eggs and uncertain eggs, as is now the case in many of our markets, there is no great inducement for our farmers to be overparticular in regard to their eggs, but we hope for better things in this direction in the near future.

Sauk Co., Wis. Wm. Wichern.

OPPOSES OPEN-AIR HOUSING.

To the Editor:—My method of feeding for winter eggs is as follows: A dry mash in a hopper, a scratch feed in a litter, plenty of cabbage and mangel beets.

I keep my laying hens in a good, warm house. I do not believe in the so-called open-air system of housing. I find that poultry do better in a warm house not overcrowded.

I keep my poultry houses thoroughly cleaned and disinfect them about once a month. I keep my nest boxes well dusted with some good commercial lice powder and I am not bothered with either lice or mites at any time.

Roup is something that will appear quite often in the winter months. If taken in time it is very easily cured by using some good roup remedy. The remedy should be used in the drinking

A FEW POULTRY TROPHIES, PERMANENT RESIDENTS ON THE WILLIAM WICHERN FARM.

water during the winter months. It should be given about every fifteen days as a prevention.

There have not been any attempts made to prevent the sale of decayed eggs, to my knowledge. Honest poultrymen wouldn't attempt to sell decayed eggs, for it would hurt their business.

Great care should be taken in selecting stock in the fall of the year. All of the best developed pullets should be put into the laying house by themselves. No male birds should be allowed to run with them until the proper time for mating comes. Great care should be taken at mating time in selecting the females. In selecting a male bird nothing but the very best type, size and color should be used as a breeder. To produce high-class stock not more than eight females should be used in a breeding pen of the heavy breeds, and not more than fifteen females should be used in the breeding pen of the lighter breeds.

Beloit, Wis. Fred Krinkey.

TONICS FOR HENS ADD TO PROFITS.

To get the best results from the poultry yard, great care must be used to protect chickens from diseases induced by changes in the weather, by poor ventilation, exposure to drafts, and other things. One means of securing such protection is the use of tonics. A tonic of tried quality is suggested by N. E. Chapman, poultry specialist of the agricultural extension division of the Minnesota College of Agriculture. It is made as follows:

Magnesium sulphate, 10 ounces; magnesium oxide, 1 ounce; iron sulphate, 2 ounces; ground ginger, 2 ounces; sulphur, 3 ounces.

One tablespoonful of this mixture in moist mash is a dose for twelve birds. Such a dose should be given each morning for three mornings, and then discontinued for a week or ten days.

Permanganate of potash may also be used in the drinking water—as much as can be piled on a ten-cent piece, in a gallon of water.

Apparently, chickens are subject to much the same ills that afflict human beings at this season of the year—colds, catarrh, bronchitis, pneumonia, diphtheria and roup.

The careful poultryman will visit his roosts at night and look and listen for signs of colds. He will at once remove any birds showing symptoms of disease, in order that the rest of the flock may not be infected. Labored breathing, wheezing, rattling in the throat, gaping and sneezing are symptoms to be looked for. The bird showing these symptoms should be treated at once with one of the following mixtures: Zenoleum and kerosene, equal parts; sweet oil and kerosene, equal parts; or chloroform, one part, and cottonseed oil, three parts. The head of the chicken should be immersed in the mixture for a moment, or a small amount of the mixture should be injected through the nostrils and mouth. This should be supplemented with the tonic already recommended, or with epsom salts in moist mash—one teaspoonful to each bird. The bird should then be kept in dry quarters and fed bread soaked in milk, and cabbage leaves.

If the roup develops, with a fetid odor, infected birds should be killed and burned, and all birds and chicken houses should be thoroughly disinfected.

MAKING A PROFIT FROM FEATHERS.

To the Editor:—Tons of feathers are lost each year in small amounts because farmers and poultrymen do not think it worth while to save the few ounces plucked from birds used at home and for local market. Another reason probably is that the prices are thought to be too small to make saving these few feathers seem worth while.

If a few minutes be taken when plucking is done to separate the various grades and to practice the best methods of curing them there is no reason why a nice little sum could not be saved and the aggregate make a considerable advance in the annual returns from poultry.

Chicken and duck, as well as goose feathers, are always in demand and should be saved, but ought to be kept separate and the larger feathers placed by themselves. In no case should chicken and turkey feathers be scalded, because the hot water removes the animal oil and reduces the grade. Such feathers scalded command only a fraction of the price paid for dry-picked ones.

Another good point is to keep the white separate from the colored feathers, because white stock brings a higher price than dark. After being plucked the feathers should be spread out until the moisture is thoroughly dried out of them. During this time they should be turned every day if they are spread at all thickly. Turkey body feathers, while too large as they come from the bird, are often chopped and used in cheap pillows.

Not long since I heard a dealer state that hen and turkey body feathers have only saving value when dry picked. They should be laid out on the floor, which should first be swept thoroughly and forked over daily and should be in a marketable condition in about three days, when they can be shipped in burlap sacks.

Chicken quills should be thrown away, never mixed with softer body feathers, because they will spoil the grade. Turkey quills should be graded, the long tails put in one box, those from the first two joints of the wings in another and those from the last joint in a third. The shorter quills and those from the rump ranging from five to eight inches placed in a burlap bag. After a thorough airing they may be packed for shipment. Moisture allowed to remain in quills rots them very quickly and thus reduces the grade. Subscriber.

CLIPPING TURKEY WINGS ADVISED.

To the Editor:—The best and easiest way to raise turkeys is to let the turkey hens hatch and raise the poults. The turkey is the farmer's friend and with the song birds and quail will rid the fields of the bugs and worms that destroy the crops. Little, if any, damage is done the grain, as they prefer bugs to anything else.

The greatest drawback, no doubt, is the hen desire to nest away from home. She distrusts her owner and will hide her nest from him, yet lay by the roadside in sight of passing teams or in the open when dogs and crows can destroy the nest. A crow may steal the eggs day after day and she will persist in laying in the same nest, but let her owner take the egg once and not leave a decoy and she will never go near the nest again.

A good way is to clip a wing during the winter and the hens will take to the henhouse to roost.

Then about nesting time place them in a yard with a fence high enough to keep them in. Some barrels placed with the openings turned so they may enter without being observed make good nests.

A little feed thrown in and plenty of fresh water keep them content. However, it is best to release them about four o'clock every afternoon or earlier if the hens have laid. They are soon at home in their new quarters and if any have been released too soon will come back to their nest to deposit the egg.

If no place is made for roosting they will have to be carried to the yard each morning. This takes only a few minutes, while locating a nest often takes a week. The nests are always safe and in a desirable place at hatching time. When the hen learns the nest she cannot drag the poults through the long, wet grass and lose or chill them. After the poults are spry enough to follow their mother all may be released to roam at will.

When the first hen wants to sit she may be given a nest of eggs and some set under Biddy. All the poults may be given the turkey hen to raise.

By this method some of the hens will need lay more than one clutch, but even then the poults will come early enough.

If the hens have been accustomed to roosting in the henhouse they will soon bring their young to roost there, too. A Farmer's Wife.

The awards as announced by Secretary Halpin follow:

BARRED PLYMOUTH ROCKS.
(Exhibition.)

D. D. Culham & Son—1st cock.
W. H. Eldridge— 2d hen, 1st and 5th pullet.
Freund Bros—3d hen and 3d pullet.
L. L. Hare—3d cock, 4th hen and 4th cockerel.
Walter P. Jagow—2d cock, 2d cockerel and 2d pullet.
John F. Johns—1st and 3d cockerel, 1st hen and 4th pullet. Best shaped and best colored male and best shaped female.
Wm. F. Belda—4th cock, 5th hen and 5th cockerel.

BARRED PLYMOUTH ROCKS.
(Cockerel Bred.)

D. D. Culham & Son—3d pullet.
John W. Dixon—3d hen.
Jos. Fix—2d and 5th pullet.
L. L. Hare—1st hen, 4th pullet and 1st pen.
John F. Johns—1st pullet.
R. D. Warner—2d hen.

BARRED PLYMOUTH ROCKS.
(Pullet Bred.)

Wm. Davenport—3d cockerel.
W. H. Eldridge—4th cockerel.
Freund Bros.—2d cock.
L. L. Hare—3d and 5th cockerel and 1st pen.
Walter P. Jagow—1st cockerel.
John F. Johns—1st cock.
J. N. Sommerfield—2d cockerel.

WHITE PLYMOUTH ROCKS.

John J. Flad—1st hen, 1st cockerel, 1st and 3d pullet. Best colored male and best shaped female.
M. C. Gerard—1st cock and 5th hen.
F. J. Holt—4th cockerel.
Urban B. Steil—2d cock; 2d and 3d hen, 2d cockerel and 2d and 4th pullet. Best shaped male and best colored female.
Edmund Huebrig—3d cock, 4th hen, 3d cockerel and 5th pullet.

BUFF PLYMOUTH ROCKS.

F. W. Kramer—1st, 2d and 4th cock, 1st, 3d, 4th and 5th hen, 3d, 4th and 5th cockerel, 2d, 3d and 5th pullet, 1st pen. Best shaped made and best shaped female.
A. J. Walker—3d and 5th cock, 2d hen, 1st pullet, 2d pen. Best colored female.
Edmund Huebrig—1st and 2d cockerel, 4th pullet. Best colored males.

PARTRIDGE PLYMOUTH ROCKS.

W. Buth—4th cock.
James Flint—1st and 2d cock, 5th hen, 1st cockerel and 1st pullet. Best shaped and best colored male.
M. C. Gerard—5th cock, 1st and 2d hen, 3d cockerel and 4th and 5th pullet. Best shaped and best colored female.
J. W. Hunt & Son—3d cock, 3d hen, 2d and 4th cockerel, 2d and 3d pullet, 1st and 2d pen.
H. A. Marscheck—5th cockerel.
Ed J. Wagner—4th hen.

WHITE WYANDOTTES.

T. O. Evans—1st cock, 1st and 4th hen, 1st, 4th and 5th pullet, and 1st pen. Best shaped male and best shaped female.
Elmcroft Yards—1st cockerel, 3d pullet. Best colored male and best colored female.
Paul Johnson—2d and 5th cock, 2d and 3d hen, 3d cockerel and 2d pen.
Fred Massey—5th hen.
Pierce Martiny—3d pen and 4th cockerel.
H. C. Risdon—2d cockerel and 2d pullet.
H. L. Templeton—4th cock and 5th cockerel.
Fred Cooper—3d cock.

BUFF WYANDOTTES.

Thos L. Clayton—1st, 2d, 3d and 5th cock, 1st hen, 2d, 3d, 4th and 5th cockerel, 1st, 2d and 4th pullet, 1st pen. Best shaped and colored male. Best shaped and colored female.
F. L. Johns—2d hen.
Jas. Livingston—3d hen.
J. R. Love—4th cock, 4th and 5th hen, 1st cockerel, 3d and 5th pullet.

BLACK WYANDOTTES.

E. S. Conry—2d cock, 1st cockerel, 1st and 2d pullet.
Robert Pribbenow—1st cock, 1st hen, 3d pullet.

SILVER WYANDOTTES.

Geo. Beckmann—2d cock, 1st and 2d hen, 1st and 2d pullet.
H. R. Burrington—3d cock.
Robert Pribbenow—5th hen.
Will Thomas—1st cock, 3d and 4th hen, 1st, 2d, 3d and 4th cockerel, 3d, 4th and 5th pullet.

GOLDEN WYANDOTTES.

F. S. Clausen—2d cock, 3d and 4th hen, 1st and 5th cockerel, 3d, 4th and 5th pullet.
Gabriel Lewis—1st cock and 5th hen.
Chas. D. Love—3d cock, 1st and 2d hen, 2d, 3d and 4th cockerel, 1st and 2d pullet, and 1st pen.

PARTRIDGE WYANDOTTES.

A. P. Anderson—2d hen.
W. W. Day—2d cock, 3d and 4th hen, 1st, 2d and 4th cockerel, 1st and 3d pullet, 1st pen.
F. H. Field—4th cock, 1st hen, 2d pullet.
J. V. Pottier & Son—1st cock, 3d and 5th cockerel.
Robert Pribbenow—3d cock, 5th hen.

Winners in Soap-Making Contest.

Mrs. G. W. May, Cambridge, Wis., Is Awarded First Prize—List of Others Who Were Awarded Cash Prizes by the Judges.

JUDGING from the number of entries in The Wisconsin Farmer soap-making contest, there must be a considerable number of our readers who are making soap at home. Out of the hundreds of entries received there were, of course, a great many very excellent samples. Of these the best pieces of soap were taken out and submitted to the editor of the Home Department, and she has awarded the following prizes:

First prize, $20—Mrs. G. W. May, Cambridge, Wis.

Second prize, $15—Mrs. Henry J. Drydyke, Milwaukee, Wis.

Third prize, $10—Mrs. Louis Ansrud, Westby, Wis.

Fourth prize, $5—Mrs. F. Opichka, Cooperstown, Wis.

Fifth and sixth prizes, $2.50 each—Mrs. Richard Grimseed, Westby, Wis., and Mrs. Josephine, Rudie, Westby, Wis.

Seventh, eighth, ninth, tenth and eleventh prizes, $2 each—Miss Mary Reilly, Stoughton, Wis.; Miss Ida Berstad, Fergus Falls, Minn.; Mrs. Florence Brainard, Lone Rock, Wis.; Mrs. W. A. Lindquist, Olivia, Minn., and Mrs. John North, Kilbourn, Wis.

Thirty-five prizes of $1 each were awarded as follows:

Martha S. Bloy, Sherwood, Wis.
Mrs. Wm. Pink, Lancaster, Wis.
Mrs. Arthur F. Seefeldt, Plymouth, Wis.
Mrs. Wm. F. Lambrecht, Lena, Wis.
Mrs. M. W. Fell, Valley Junction, Wis.
Mrs. M. V. Obert, Battle Lake, Wis.
Mrs. M. H. Malloy, Plaza, N. D.
Mrs. G. Laarman, Oostburg, Wis.
Mrs. Herman Nohns, Platteville, Wis.
Mrs. John Michelet, Westby, Wis.
Miss Mabel P. Lund, Mt. Horeb, Wis.
Mrs. C. P. Ruliffson, Russell, Minn.
Mrs. H. M. Strand, Baldwin, Wis.
Mrs. J. Heeger, Prairie Farm, Wis.
Mrs. Christ Halverson, Kendall, Wis.
Mrs. Herman Dusell, Beaver Dam, Wis.
Mrs. H. G. Claseman, Long Prairie, Minn.
Mrs. H. H. Traveller, Forest River, N. D.
Mrs. Adolph Klammer, Stewart, Minn.
Mrs. Herman G. Strasburg, Fall Creek, Wis.
Mrs. C. W. Gebhardt, Sullivan, Wis.
Miss Ella E. Mueller, Muscoda, Wis.
Mrs. John Mueller, Muscoda, Wis.
Mrs. W. Blahnik, Lena, Wis.
Mrs. F. A. Wilcox, Knowlton, Wis.
Mrs. Erick Resvick, Doyon, N. D.
Lucy D. Brown, Ellsworth, Wis.
Mrs. Gustav Koebrick, Stewart, Minn.
Mrs. Bertha Koch, Summit, Wis.
Mrs. Anton Theine, Menominee Falls, Wis.
Mrs. Margaret Pellkofer, Peshtigo, Wis.
E. H. Shafer, Hales Corners, Wis.
Rosie Bencher, South Germantown, Wis.
Mrs. Ed Holverson, Neillsville, Wis.
Mrs. Oliver Johnson, MacFarland, Wis.

Those who were not included in the list of prize winners have by this time received from The Wisconsin Farmer the needlecase promised to every woman who entered the contest. If, for any reason, anyone entering failed to receive the needlecase The Wisconsin Farmer will appreciate being advised at once.

The publishers take this opportunity to thank all who took part in the contest.

The paper-white narcissus should be coming into bloom. It may be grown in jars containing rocks and water. The bulb should just touch the water.

Wreaths of spruce and red ruscus may be made at home. If the evergreen carries cones the arrangement may be prettier. Tie the green to an apple barrel hoop.

Comfort Indoor Closet

ODORLESS SANITARY GERM-PROOF

Every home without sewerage needs one. Most convenient, meritorious home necessity in a century. A boon to sick people. Can be placed anywhere in house.

Makes Outdoor Privy Unnecessary

Put a warm Comfort Toilet in your home; a guarantee of healthy, sanitary conditions. Germ-life killed by chemicals in retort. Emptied once a month—no more trouble than throwing out coffee grounds. Needs no other attention. Boards of Health endorse it. Write now for literature, prices, etc. **Agents wanted—exclusive territory.**

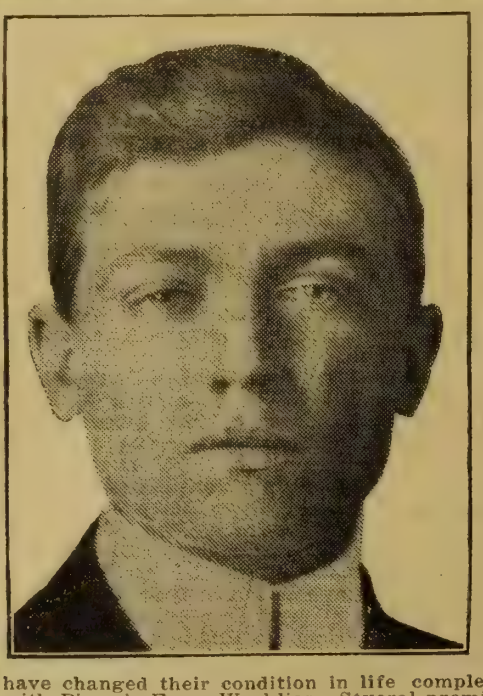
FREE 1916 PLANTING GUIDE AND PURE SEED BOOK

This 116-page four color book describes all new 1916 varieties vegetable and grain crops. Hundreds of illustrations, beautiful grounds, flower and vegetable gardens, landscaping, shrubbery, orchards, farms. All about alfalfa, clover, vetch, modern varieties field corn. A dictionary of gardening, encyclopedia of field crops! A flower lover's delight! A berry grower's book! An orchardist's manual! Most wonderful gardening guide-catalog ever published. A postal brings it to your home. Don't miss this book!

GALLOWAY BROS. & CO.
31 Galloway Sta, Waterloo, Iowa



He Earned More Than $350 During Nov. and Dec. 1915 Soliciting Subscriptions

C. H. Miller has at last found the money-making opportunity that he was looking for. In October, 1915, he started soliciting subscriptions to Pierce's Farm Weeklies, and during the following months of November and December he earned more than $350 as a subscription solicitor, which is probably twice as much as he could have earned at any other kind of work. His period of "stinting" and "doing without" the things he actually needs is over with, for he now has plenty of money and can earn more, faster and easier than ever before.

The young man who forges ahead and prospers is the one who takes advantage of every opportunity to better his condition. Scores of young men who were plodding along on a small salary have changed their condition in life completely by securing a position with Pierce's Farm Weeklies. Several prominent men who are now holding responsible positions in large cities drawing salaries of from $3,000 to $4,000 per year got their start in this way.

The valuable course of training we give our representatives teaches them how to become successful salesmen, and good salesmen are always in demand at a good salary. The Wisconsin Farmer, published at Madison, Wis., can use a few reliable men in Wisconsin. It is the leading agricultural paper in its territory and is easily sold to farmers. Write at once for particulars.

AGENCY DIVISION **WISCONSIN FARMER, MADISON, WIS.**

Pierce's Farm Weeklies are composed of the following well-known publications:

The Wisconsin Farmer, Madison, Wis.
The Iowa Homestead, Des Moines, Iowa.
The Farmer and Stockman, Kansas City, Mo.

THE INFLUENCE OF COLOR IN HOUSE FURNISHINGS.

Pretty soon we are all going to be thinking about housecleaning again and fixing up the shabby places in the house. Some rooms will need new curtains this spring some new rugs, new paper or new draperies. Whatever they need, the thing most to be desired is a harmonious effect when the work of redecorating is completed.

There is always so much hard work to do at housecleaning time that it is a good plan to have all the details worked out well in advance. The housekeeper who has a well-ordered, harmonious, restful looking room in her mind's eye when she starts is half through the worry of housecleaning before she even begins.

One of the things to think about when planning the redecorating of a room is the color scheme. Lack of harmony in color does more to mar the beauty, comfort and service of home furnishings than any other one thing. Moreover, scientists have gone to the trouble to prove for us that various colors affect the human nervous system in different ways. For instance, red excites the nerves and in extreme cases constant association with it has been known to cause insanity. On the other hand, blue is depressing, while yellow has a cheering effect. Green, which is a combination of yellow and blue, produces a restful influence upon the human system.

Besides this, it has been found that the natural qualities of the various colors divide them into two general groups, first, those which are termed warm or advancing colors, and, second, those which are known as cool or receding colors.

In the group of warm colors are red, yellow, orange and the different shades and tints of these colors. It is supposed that the term "warm" was used originally because of the association of these colors with the sun and fire; the term "advancing" because of the effect of nearness which they produce when used over large areas.

The cool or receding colors include blue, green, violet and all shades and tints of the same. The terms "cool" and "receding" are used because of the association of these colors with the sky, trees and water and the effect of distance which they produce in a small area.

It will readily be seen, then, that color plays an important part in securing the desired effect in any given room. For instance, a large room will look smaller and more cozy if done in warm colors, while, on the other hand, a small, cramped room may be made to appear larger if cool or receding colors like gray, green, blue and mauve are used in paper or hangings. Also, a cheerless north room may be brightened by the use of warm tints. or a south room cooled by employing cool grays or greens. All the shades of brown, tan, cream, russet and yellow-green are the exponents of the warm colors.

With this as a basis, the next thing to consider is a combination of colors to produce a harmonious effect. A room done all in green of one shade would be tiresome, as would one in a single shade of brown or blue. Nature has demonstrated that certain combinations are harmonious, so that we may assume what is known as sets of complementary colors. For example, red and green, yellow and violet, blue and orange. All of these combinations are found in nature and the colors in each group, or the shades or tints of such colors, blend in with one another in a way pleasing to the eye. A practical application of this knowledge of complementary colors may be made in house decoration, by combining the tones which come from these sets of complements. For example, plum and buff is a pleasing combination, or russet and sage, or slate and citron.

The charm of any creation lies in the contrast of variety of its proportions, value and color. By variety in proportion is meant the irregular breaking of the whole surface into various sizes and parts, but with such a subtle relation of those parts that they combine to make a pleasing whole. The broadest field for gaining contrast and variety is by means of color, but unless color combinations are carefully made they cease to be harmonious. There are three ways of gaining contrast by color, namely, by related tones, that is tints and shades of the same color, by complementary colors, and by combining plain and figured surfaces. In this connection it may be said that there is more danger in having too much contrast by figures than not enough. When the wall space is divided by molding, both parts should never be covered with figured paper. It should be remembered, too, that large-figured paper is out of place for the average-sized room, and that naturalistic representations of flowers and fruit are also impossible for wall coverings. If figured paper is used at all, or rugs either, for that matter, the small, indistinct figure is more suitable for a home.

Every housekeeper should plan the redecorating of her home this spring so as to produce the greatest degree of comfort and beauty with the means at her command, and in doing this color should receive due consideration. Simple draperies or curtains of the right material, a new rug that harmonizes with the paper or paper that harmonizes with the rug, a different cushion or table cover may make all the difference in the world in the looks of a room. And if all these details are planned now and the new materials gotten together the real work of housecleaning and decorating will be more of a pleasure than a drudgery. It will mean the working out of a definite plan of making the home more livable and more beautiful, rather than the hard work of getting rid of the accumulated dust and dinginess of winter.

A SCORE CARD FOR BREAD.

It would be a good plan for housekeepers to score their bread, suggests Miss Nola K. Fromme, of the home economics department of the Colorado State College. Following a score card would soon bring up the standard. The following card is recommended by Miss Fromme:

Flavor	35
Lightness	15
Grain and texture	20
Crust—color, depth, texture	10
Crumb—color, moisture	10
Shape and size	10
Total	100

Flavor is most important, for the value of bread depends largely upon its taste.

The bread should be light throughout determined largely by use of the proper amount of yeast, and allowing bread to rise the proper length of time (until it just doubles its bulk).

Grain and texture are decided largely by the kneading which evenly distributes the yeast, thus insuring a fine, even grain.

The crumb should be creamy white, not dingy and gray, and should be moist and elastic, with no doughiness.

The crust should be thin, golden brown and flaky.

The loaf should not be too large to bake well in the center. A moderately stiff dough in an oven neither too hot nor too slow should give good results.

STOP WORRYING.

Did you know that worrying was one of the most unhealthful habits you can have? Worry, the doctors tell us, is more a question of hygiene than of religion, and it is definitely known to seriously injure the body. They say than many of the most distressing of our physical ailments are due to worry alone.

You will find that the pulse of a man who has the worry habit is irregular, he sighs frequently, his respiration is repressed and he is apt to be pale of face and his extremities cold.

The doctors' explanation for this is that through the influence which mind exercises over matter, the worry has affected the heart, impairing the circulation. And the worst of it is that if the worry is not gotten rid of a case of chronic heart disease will be the result.

Worry has the same effect on the stomach, causing loss of appetite and general derangement of the digestion. Haven't you known many a dyspeptic who was at the same time a chronic worrier?

All this being true, it is just as important to guard against the habit of worry as it is to guard against wet feet or a drafty room. This may call for the exercise of a good deal of will power, but that, also, might be good for the average individual.

A DAY WITH LEFT OVERS.

Left overs are like the poor, they are always with us.

There are none who care to know that they are being served with left overs no matter how appetizing these may be made. Yet even in the best-regulated families there are bits of left-over food, which if care and thought is used, may be served again without a suspicion that they are rehashed.

The soup kettle has been aptly termed the kitchen waste basket, receiving many a choice culinary manuscript which might otherwise go for naught. Foods thrown away by extravagant cooks would feed an entire family, and well.

Girls should be taught, as they are taught religion, that waste is a crime and that nothing should be thrown away that can be used.

If one inquires into the history of certain families that are still without a bank account after years of prosperity, a visit to their garbage can supplies the reason. The homely saying is here in force—"More is thrown out of the back door with a tablespoon than is brought in the front door in a wheelbarrow."

It is as necessary that the young woman should be trained to spend money wisely and use economy as it is that the young man should supply the money for her use.

Now for a few examples. The bones and carcass of a turkey cracked and put into cold water, then brought to the simmering point and cooked for several hours makes a good-flavored broth which may be used in any number of ways—to make soup, as a liquid for meat sauces and as a flavor for gravy. The bits of meat left on the bones by the carver, if cut in bits, added to thick, well-seasoned gravy (also a left over) placed in a baking dish and covered with seasoned mashed potatoes, brushed with egg to make a nice brown crust, then baked, is a dish which the entire family will like.

A half cupful of stewed tomato more or less may be added to the turkey bone broth with celery salt, salt, pepper and two tablespoonfuls of boiled rice and you have a fine hot soup to serve on a cold night.

A half cupful of canned salmon is left from a previous meal. Shred the fish with two forks, add a chopped sour pickle, or a few olives, some chopped cabbage and a little celery with a simple boiled dressing, the result is a most appetizing salad which may be served on lettuce or shredded cabbage. Tuna fish is especially good served this way or hot with riced potatoes. Place the hot fish in the center of a hot platter, surround with seasoned riced potatoes, then around this pour a thick, rich, white sauce.

When cooking carrots to serve in any ordinary way reserve a few cooked whole, then later serve them cut in strips seasoned with butter and lemon juice. Serve very hot. A grating of nutmeg or a dash or two of cayenne pepper is liked by some for a little zest.

Any small amount of cranberry jelly if cut in cubes may be served as a pudding garnish with hard sauce or whipped cream.

Fruit juice left from canned fruit will make delicious pudding sauces or as liquid in fruit cake and as salad dressings for fruit, particularly if it is light in color like peach, pear or pineapple juice.

Small pieces of fruit cake or plum pudding if crumbed and mixed with chopped nuts, then stirred into sweetened and flavored whipped cream, makes a most dainty and enjoyable dessert. This may be served in sher-

$2.25 Aluminum Griddle For 85 Cents in Cash

Special Offer to Karo Users

Read the Offer and Write Today So As to Be Sure To Get Your Griddle.

BY special arrangement you can get this fine 10½ inch Solid Aluminum griddle for less than the wholesale price.

Go to your grocer, get 50 cents worth of Karo and send us the labels and 85 cents and you'll get the Aluminum Griddle by prepaid parcel post.

You know Aluminum ware—you know how long it lasts, how much easier it is to cook with. It doesn't chip, it doesn't rust and it always looks so bright and clean and inviting.

You don't have to grease this Aluminum Griddle; it does not smoke up the house; it bakes griddle cakes and corn cakes crisp and light—the way you want your griddle cakes to be. And the cakes are far more digestible and better flavored.

At great expense we are seeking to place a Karo Aluminum Griddle in the homes of all Karo users, so that Karo—the famous spread for griddle cakes and waffles—may be served on the most deliciously baked cakes that can be made.

Last year the people of this country used 65,000,000 cans of Karo—*the largest demand ever given any syrup.*

That shows you what people who know Karo think of it, how much better they like it than any of the old kind of syrups.

Take advantage of this chance to get this solid Aluminum Griddle at a clear saving of $1.40 in cash.

Get the Karo Today—and send us the labels and 85 cents (P. O. money order or stamps) at once. We will also send you *free* the Corn Products Cook Book.

bet cups garnished with a cherry or bit of preserved ginger.

Though the subject of left overs is by no means exhausted, these suggestions may prove helpful in solving some difficulties. And we have the best of authority for using economy for the Good Book says, "Gather up the fragments that remain that nothing be lost."—[Nellie Maxwell.

RECIPES.

Fried Oysters.—Drain the juice from one pint of oysters; add to this juice an equal amount of milk or cream, one egg beaten light, salt and pepper to taste, and flour to make batter as for pancakes. Turn oysters in batter, drop one oyster in spoonful of batter into deep fat. Fry a delicate brown.

Simple Fried Oysters.—Select choice oysters, roll in egg and cracker crumbs, and fry a delicate brown in butter.

Oyster Omelet.—One teacup oysters drained and chopped, three eggs (yolks and whites beaten separately), salt and pepper, one tablespoonful of thick cream. Pour eggs and seasoning in hot buttered pans. When the eggs ars set turn in the oysters and roll up.

Escalloped Sweet Potatoes and Apples (A southern dish).—Use ordinary apple sauce and boiled sweet potatoes sliced thin. Fill a baking dish with alternate layers, placing the potatoes on top. Sprinkle with sugar and dot with butter and bake one hour. The apple juice will cook to the top and form a rich brown crust. This is especially fine with wild duck or other game.

Apple Roll.—Two medium sized sour apples, three-fourths cup sugar, one cup water. Make a rich baking powder dough. Roll out about one-half inch thick, spread the sliced apples over the dough and sprinkle with a very little sugar. Roll as for cinnamon rolls, cut off slices about one-half inch thick. Boil the sugar and water two or three minutes. Pour it into the bottom of a shallow baking pan. Lay the apple roll in it. Sprinkle a little cinnamon and sugar over all. Bake in moderate oven until apples are done and crust a golden brown. Serve with thick sirup or cream.

Salmon Loaf.—One can salmon. Pour off the liquor, pick out the bones and skin and mix smoothly. Add four teaspoonfuls melted butter, one-half cup fine rolled crackers, and season with pepper and salt and a little grated onion. Beat three eggs thoroughly and add to the mixture. Steam in a round can one hour and a quarter. Always tie a cloth on the under cover of the steamer to absorb the beads of water. When ready to use lay the roll on a platter, garnish with parsley, and serve in slices with tomato sauce. Cold salmon loaf, made the day before using, can be reheated and is excellent.

Tomato Sauce for Salmon Loaf.—Boil one pint of canned tomatoes with one cup of water and several slices of onion, according to taste. After cooking ten or fifteen minutes, rub through a sieve, pulp and all, except seeds. Blend a large tablespoon of butter with flour in a frying pan, add the tomato juice and make a creamlike sauce. Season well, cook thoroughly and serve hot in a gravy bowl.

Apple Whip.—One cup unsweetened apple sauce, whites of three eggs, three tablespoons powdered sugar, one-fourth teaspoon baking powder, juice and rind of one-half lemon. Beat eggs until stiff, add sugar and baking powder. Cut and fold in the apple sauce mixed with the lemon. Turn into buttered dish, set dish in pan of water, bake in slow oven until firm to the touch.

SUGGESTIONS FOR THE HOUSEWIFE.

Boiling water poured over raisins makes them seed easily.

A dish of water in a hot oven will prevent food from burning.

For convenience in cleaning lamp chimneys nothing is nicer than a small sponge attached to the end of a stick.

Keep an apple in the cake box. It will impart moisture to the cake and keep it from drying.

To make your hands smooth and pliable after being in suds or lye use vinegar.

If brooms are wet once a week in boiling suds they will become very tough, will not cut a carpet, will last much longer and will always sweep like a new broom.

When a knife has been used to cut onions wipe it with a damp cloth and rub it briskly with coarse salt. The objectionable smell will then entirely disappear.

Do not throw away your egg shells; they are very useful when cleaning decanters. Crush the shells into small bits and shake them well in the decanters when they are three parts filled with water.

To separate stamps that have become stuck together try the following method: Lay a thin piece of paper over them and run a hot iron along it. This will make them come apart easily and the gum will still remain.

When making French fried potatoes they are often too hard all the way through, or too soft, and not crisp on the outside. This can be prevented if they are soaked first in cold water, then put for a moment in hot water, and then dried on cheesecloth. Potatoes prepared in this way will be crisp and light brown on the outside and soft in the inside.

NEW KEROSENE LIGHT

Beats Electric or Gasoline

MEN WITH RIGS OR AUTOS MAKE $300 A MONTH

10 DAYS FREE
Send No Money

We don't ask you to pay a cent until you have used this wonderful modern light in your own home ten days—we even pay transportation charges. You may return it at our expense if not perfectly satisfied after putting it to every possible test 10 nights. You can't lose a cent. We want to prove to you that it makes an ordinary oil lamp look like a candle; beats electric, gasoline or acetylene. Lights and is put out like old oil lamp. Tests by Government and 33 leading Universities show it **BURNS 50 Hours On ONE GALLON** common kerosene (coal oil), and gives more than twice as much light as the best round wick open flame lamps. No odor, smoke or noise; simple, clean, no pressure, won't explode. Several million people already enjoying this powerful, white steady light, nearest to sunlight. It's GUARANTEED.

No Money Needed
We Furnish Capital

Without any sales experience, yes even without capital, you can make a big success by placing the Aladdin on trial. If you haven't capital we will help you with our liberal credit plan.

Every home wants and needs this wonderful light, that from half the usual amount of oil produces the brightest, mellowest light obtainable. To sell the Aladdin is a simple matter of getting the light into people's hands. After a trial nobody wants to go back to old feeble lighting methods. Hundreds of men are making $100 to $300 a month. Here are two letters just like thousands we receive:

"Out of eight calls I sold six. Then ordered in four dozen lots and sold five lamps a day. My patrons all say they are fine after using them a year."—H. B. Stewart, S. Dak.

"Between Jan. 2 and Feb. 20, I sold about 275 lamps. I never saw anything that would sell equal to it."—Charlie Conrad, Ohio.

Get One FREE We want one user in each locality to whom we can refer customers. THE YOUNG FOLKS

All letters from boys and girls to this department should be sent to office of The Wisconsin Farmer, Madison, Wisconsin.

MISS DOLLY HAS A CARRIAGE.

Dear Young Folks:—I read your letters in the paper and like them very much. I thought I would like to write to you and see if I could join your circle.

I live on a farm about a mile and a half from town. We have fourteen horses and ten cows. I have a pony for my very own and he is just about as small as a Shetland pony. His name is Blackey. I also have a dog and a cat. My dog's name is Fannie. I can drive her just like a pony. My uncle made me a harness and a cart that I put my doll in.

I go to school and am in the fourth grade. I will write again if I see my letter in the paper. —Susie.

HELPS WITH THE MILKING AND THE COOKING.

Dear Young Folks:—I enjoy reading your letters very much. I live on a farm of 120 acres. Our farm is five miles from town. My sister and I go to school. Our house is only eighty rods from the school. I am twelve years old and am in the seventh grade. There are twenty-eight in our school and we had a fine program the 23d of December.

I milk three cows and feed the chickens and the geese. We raise chickens, geese, pigs and cows. This year we raised 400 young chickens. We have three horses and eleven head of cattle.

I help with the meals every day.
—Vivian.

SAVES COVERS FOR DRAWING SKETCHES.

Dear Young Folks:—As I have read the Young Folks' page for several years and always enjoy it I think it is my turn to entertain the young people. The first thing I look for when papa brings the paper home is the Young Folks' page. Then I turn and look at the cover of the paper. And I can praise the editor for something—the cover always shows a beautiful farm scene. I enjoy saving these for drawing sketches.

We live in town and own a beautiful home. We have a Ford car, one cow, two stallions and a little pet dog. We have only been in town two years and papa says that just as soon as we have finished school he is going back on the farm.

I am in the seventh grade, but cannot study very much on account of my eyes. I have always had to wear glasses and sometimes I have to miss school in order to rest my eyes.

I have a piano and will take up the fifth grade of music some time in Feb-

Making Hens Lay GOLDEN EGGS

THE demand for poultry and eggs is always far in excess of the supply. With the latter at 5 cents each throughout a major portion of the year, they are truly "golden eggs". Know how to make your hens lay and where to market. The American Poultry Advocate is America's authority on these and kindred subjects. Handsomely illustrated. Up-to-date. Fifty cents a year

ruary. I can also do several kinds of needlework.

My letter is getting long, so I will drop off, but will come again some other day. —Elizabeth.

International Sunday School Lesson

Lesson for January 16, 1916
(By E. O. SELLERS, Acting Director of Sunday School Course.)

PETER'S SERMON AT PENTECOST.

LESSON TEXT—Acts 2:14-47.

GOLDEN TEXT—Whosoever shall call on the name of the Lord shall be saved.—Act 2:21.

Comparing verse one (R. V.) with the last clause of verse 15, we conclude that this was one early morning prayer meeting which drew a crowd. In this crowd (vv. 9, 10) and on this occasion we see in miniature the evangelism of the world. What Peter hoped to accomplish is an interesting speculation and is answered by his manner and mode of testimony. His famous "sermon" consists of twelve verses, and the balance is quotations from Joel, Psalms, etc.

I. The Empowered Witness, vv. 14-36. (1) Peter testified that Jesus is alive. (a) These men, speaking by the power of the Spirit, are not drunken, but are speaking in a soberness of a great fact. (b) This that they hear "is that" prophecied by Joel (2:28, 29). This Jesus of whom they have been speaking had fulfilled this prophecy by mighty deeds (v. 22), by having risen from the dead (v. 23) and of this the disciples were all witnesses (v. 32); he had also been "exalted" (v. 33), and his glory Peter had witnessed upon the mount (II Peter 1:16-18). Peter asserts that whosoever believes in Jesus as Lord and Christ, the Anointed One, the Messiah, shall be saved (vv. 21, 36). (a) He shall be saved from sin and misery in this world; (b) saved unto a life eternal; (c) he shall receive this same power the disciples had received. Peter's witnessing is the same as Jesus has a right to expect of us, the testimony of personal experience, backed up by the word of God. Jesus was indorsed by his miracles, the testimony of those who had seen him as the risen Lord and by his fulfillment of Messianic prophecy.

He has also exalted in the testimony given in all tongues by the empowering spirit.

II. The Powerful Result, vv. 37-42. The truth of Peter's words was carried home by the Holy Spirit producing deep conviction of sin. (1) **Conversion.** The question of verse 37 was a result. They had seen the place of Jesus in the plan of prophecy of God. They saw the boldness of these disciples and they also saw their sin. (2) **Confession.** Peter's answer to their question was plain and simple. (a) "Repent," i. e., change their minds and their attitude towards Jesus, from that which had caused his crucifixion, to one of absolute surrender, of repentance and renunciation of sin; the surrender of the will to Jesus as Lord. (2) "Be baptised." Outward water baptism is involved, but it is the symbol of the inward change of heart, of the renunciation of sin, death to self (Rom. 6:4) and the putting on of Christ (Gal. 3:26,27). (3) **Continuance (v. 42).** Having accepted and confessed Christ, they were to teach others, to have fellowship with believers in prayer and in breaking of bread, to continue "in the way."

III. Added Evidence of Power, vv. 43-47. This passage is not a brief for communism. It is interesting to note that this communism was among believers (v. 44). It was for a special occasion, for they had "tarried at Jerusalem" many days, and beyond doubt had not provided for a long visit. It was according as each "had need." It was purely voluntary (5: 4,9). The Holy Spirit, however, does bring unity and altruism among believers which expresses itself in social relations and service. There is a difference between the gift of the Holy Spirit and the Holy Spirit's gifts (I Cor. 12). The baptism of the Holy Spirit or "the gift of the Holy Ghost" is always dependent upon **real repentance and is accompanied by remission of sins.** This experience is the blood-bought right of every believer in the Lord Jesus Christ. To "receive" is to take or to claim, and by simple prayer and faith that to which we have a right (Acts 4:31; 8: 15, 16; Luke 11:13; I John 5:14, 15). By making Jesus Lord and Christ we shall receive the promise (v. 39) which, Peter declared, was for Jewish believers, their children for coming generations, and "all that are afar off, even as many as the Lord our God shall call," i. e., Gentiles of every coming century.

In other words, Pentecost was but an episode which ushered in an age, the age of the Holy Spirit, and he is for every child of God, Jewish and Gentile, in every age and in every church.

During that apostolic age every new manifestation of the spirit through its accompanying addition to the number of believers—"The Lord added day by day those that were saved . . . many believers; believers were the more added . . . multitudes of both men and women . . . the word of God increased; a great company of the priests were obedient to the faith."

Peter's sermon honors the Scripture, Christ and the Holy Spirit. The spirit can and does use the living word in preparing men for the kingdom of God.

OUR FASHION DEPARTMENT.

ALL PATTERNS, 10 Cents Each.

THIS department is prepared especially for The Wisconsin Farmer. We can supply our readers with high-grade, perfect-fitting, seam-allowing patterns at 10 cents each, postage prepaid. Full directions for making, as well as the amount of material required, accompany each pattern. When ordering, all you have to do is to write your name and address plainly, tell us the correct number and size of each pattern you want and inclose 10 cents for each number. We agree to fill all orders promptly and guarantee safe delivery. Address all orders to The Wisconsin Farmer, Madison, Wis.

7530 Ladies' Waist.—Cut in sizes 34 to 42 inches bust measure. This waist shows the new back closing. The material is full in front and slightly gathered in the back. There is a high collar with a turnover section. The sleeves are wide and full, gathered at the wrist with frill finish.

7521 Ladies Skirt.—Cut in sizes 22 to 32 inches waist measure. This skirt is cut in three gores. At the upper part it is trimmed with applied yokes, having long tabs at the sides and at the lower part of each side seam in a little plaiting made of an extension of the skirt material.

6937 Ladies' Waist.—Cut in sizes 34 to 44 inches bust measure. This natty shirt waist has back and shoulder yoke in one, while the fronts are gathered at the top and open in the center, displaying a plain vest cut in one with the collar.

7370 Girls' Dress.—Cut in sizes 6, 8, 10, 12 and 14 years. This simple frock is made with a plain blouse, closing in the center of the front, with a wide collar at the high neck and with turnback cuffs finishing the sleeves, which may be full length or shorter. The skirt is cut in two pieces.

7168 Boys' Dutch Suit.—Cut in sizes 2, 4, 6 and 8 years. One of the novelties is shown in this model. The shirt is very plain and snug with front closing and large collar at the neck. The sleeves may be long or short. The trousers are buttoned on the outside of the waist at a raised waistline.

6946 Ladies' Apron and Cap.—Cut in sizes 34 to 44 inches bust measure. This smart bungalow apron can replace the dress if desired. It has a deep yoke in front and back, short sleeves and plain front and back, joined to the yoke without fullness. The gathered cap has a plain band edge.

7506 Girl's Dress.—Cut in sizes 8, 10, 12 and 14 years. Quite a dressy frock is here obtained by the use of two materials. The waist and the underskirt are of plain serge, while the tunic and collar and cuffs are of plaid. There is an applied box plait down the center of the front.

7496 Ladies' Dress.—Cut in sizes 34 to 42 inches bust measure. This stylish one-piece dress has a full length tuck at each side of the waist with the closing under the left one. The neck may be plain and high, or low with wide collar. The skirt has four gores.

6935 Girls' Dress.—Cut in sizes 6 to 14 years. This frock has a shoulder yoke cut in one with the sleeves which are of three-quarter length and finished with a cuff. The fronts are full, and so also is the back. The waist has a body lining.

7525 Ladies' Night Gown.—Cut in sizes 34 to 44 inches bust measure. In this simple gown the material is gathered at the neck in both front and back and the neck is made either high or low. The sleeves are full, with gathers at shoulder and wrist. Such materials as cambric, muslin, outing flannel and albatross are used for these garments.

Price of any of these patterns 10 cents each.

One of our 38 designs

Shipped Free

To You—A Superb WING Piano

Yes, we will ship free—absolutely free to you a Genuine highest grade Wing Piano DIRECT from our own factory, *freight prepaid.* The most surprising—most amazing offer ever made. We, the manufacturers of Wing Pianos for 45 years will send you a genuine Wing Piano or Wing Player-Piano in any shade of mahogany, walnut or oak, tested and guaranteed by us, without one penny from you. You do business **direct with the factory, which has sent out more than 45,000 pianos.**

No Money Down Freight Prepaid

We ask no money down—no security— no deposit in your bank—no guarantee. Just choose any Wing from our large catalog. We employ **no salesmen** of any kind to visit and annoy you. We'll ship the instrument, no money down—all freight paid in advance by us. While the piano is in your home use it just as if you owned it. Play the piano—let your friends play it. Examine it carefully—inside and outside. Take music lessons on it if you like. At the end of the 4 weeks trial, if you wish, you may return the piano at our expense. We pay return freight to New York. Not a penny to pay for the pleasure of using the piano four weeks.

Rock-Bottom Price Direct

You will be amazed at our rock-bottom direct-from-the-factory proposition on the genuine highest grade Wing. No other manufacturer has dared to meet our baffling offer. Let us quote you prices that local dealers cannot possibly approach, on the sweetest toned piano, **positively guaranteed for 40 years.** All freight prepaid by us. Four weeks free trial first. *No deposit.*

A piano, as you know, is *the treasure* that *completes* the home furnishings. Without a piano there is always **one thing** missing. Your opportunity is here now. You may have a piano in your home free any time you want it. Unless you are charmed with the delightful tone—the splendid beauty of the Wing Piano, send it back at our expense. Unless you are fully satisfied, we would rather you would not have it, because we want every Wing to sell another Wing.

We'll buy your old Organ or Piano on the most liberal of all offers. Be sure to get our proposition before you sell or trade your old instrument. *Do not overlook this opportunity.*

Valuable Book Free

"The Book of Complete Information About Pianos"

This book is absolutely free. It is one of the finest piano books ever published. 136 pages. It tells you just how to judge a piano. It contains ten tests to apply to every piano. Apply these tests to any piano and you will know absolutely whether that piano is a good piano or not. You see WHY we can give you an absolute 40-year guarantee—a 40 year guarantee from the manufacturer. Send coupon below.

KATHLEEN NORRIS
Author of "The Heart of Rachael"

Would You Leave Your Husband IF—

If you were young, beautiful and refined—

If you discovered that your millionaire husband was a dissolute drunkard—

Would you put up with his degrading insults, as the price of a luxurious home, jewels, motor cars and gorgeous clothes—

Or would you leave him, to risk the future with the man you had learned to love in spite of yourself?

This is the distracting problem Rachael Breckenridge has to face in the greatest novel ever written dealing with a woman's inner heart-struggles—

"The Heart of Rachael"

By KATHLEEN NORRIS
Author of "The Story of Julia Page"

By far the most absorbing book Kathleen Norris has ever produced. More vital, more dramatic, more intense even than "The Story of Julia Page," the Pictorial Review sensation of last spring.

"The Heart of Rachael" lays bare before us the most vivid and compelling story of a woman's soul ever recorded!

The characters live and breathe! One tremendous climax follows another! Read the first chapter of this story and you simply cannot lay it down.

Begin "The Heart of Rachael" in the February issue of Pictorial Review. It will be finished quickly in four generous instalments concluding with the number on sale April 10th.

Winning the Wilderness

By Margaret Hill McCarter

Author of "The Price of the Prairie," "A Wall of Men," "The Peace of the Solomon Valley," etc.

(Copyright, 1914, A. C. McClurg & Co.)

CHAPTER XXIII—Continued.

Before him were the little brown coolies holding the ladder, and up its slender swaying height, round by round, went young Titus nimbly as a squirrel up a cottonwood limb.

The Kansas men went wild.

"Rock Chalk! Jay Hawk! K U! oo!" they shouted again and again, ending in the long quavering wail as the University yell must always end.

Up and up went Titus, sixty feet, to the top of the wall. Then as he stood above the strange old Oriental city, filled now with frenzied fighters; above the twelve thousand soldiers sent hither from the far homelands beyond the seas to rescue human beings from deadly peril. As he stood over all these, a target for a hundred guns, the khaki-clad young Kansas lifted his right hand high above his head and swung out the Stars and Stripes to all the breezes of that August morning.

Then came the belching of cannon, the bursting of huge timbers, the groaning of twisting iron, and through the splintered gates the Allied Armies had entered the city.

Inside the walls the hundred thousand Boxers renewed the strife. The walls and gates of the Foreign Legation were as stubbornly defended by the Chinese fanatics on the outside now as the besieged Christians had defended them against the Chinese on the inside. Entrance was made at last through the sluiceway, or open sewer, draining out under the city walls.

It was a strange looking line of creatures who came crawling, waist-deep in filth, through the sewer's channel. The old Aydelot sense of humor had saved Thaine many a time. And he wondered afterward if he had not seen by chance the ludicrous picture of himself in a huge mirror, if his heart would not have burst with grief when Pryor Gaines came toward him, mute and pallid, with outstretched hands.

The little group of soldiers who had fought and marched together had not had off their clothes for seven days, A stubby two weeks' beard was on each face. Their feet were raw from hard marching. Rain and dust and mud and powder smoke had trimmed their uniforms, and now the baptism by immersion in the Compound sewer had given them the finishing touches. But the gaunt-faced men and women, the pitiful, big-eyed children, whose emaciated forms told the tale of the six weeks' imprisonment, made them forget as these poor rescued Christians hugged and kissed their brave rescuers.

Thaine hadn't kissed any woman except his mother since the evening when he and Leigh Shirley had lingered on the Purple Notches in a sad-sweet moment of separation. It lifted the pressure crushing round his heart when he saw Goodrich, with shining eyes, bending to let a poor little missionary stroke his grimy cheek.

The Boxers retired by degrees before the superior force, entrenching themselves inside the Imperial City. Never in its history, centuries on centuries old, had this Imperial City's sacred precincts been defiled by foreign feet. Here the Boxer felt himself secure. Here the gods of his fathers would permit no foreigner to enter. On these hoary old walls no Christian would dare to stand. On three sides of the Imperial City these walls were invincible. The fourth was equipped with six heavy gates.

In a council of the Powers the impossibility of storming these gates was fully made clear. The number of soldiers was carefully estimated—American, Japanese, Russian, German, French, and Italian, Sikh and Sepoy, Bengalese, Scotchman, Welch and Royal Englishmen. All had suffered heavily in this campaign. None more grievously than the Americans.

The decision of the council was overwhelming that the Imperial City could not be taken by this little force outside its battlements. Only General Chaffee protested against giving up the attempt.

"Can your men take those walls?" The query came from the leaders.

"My men can take hell," General Chaffee replied, with less of profanity than of truth in his terms. And the attempt was given over to the Americans.

One of the six gates stood wide open, a death trap laid by the wily Boxer, believing that the foreign forces would rush through it to be shot down like rats in a hole. Beyond it was a paved court five hundred yards wide, reaching up to a second wall, equipped likewise with six great gates.

Thaine's company was singled out to go inside the open gate and draw the Boxer fire toward themselves while the American army stormed the closed gates. The little group of men lay flat on the pavement, defending themselves and harrassing the enemy. They knew why they had been sent in, but they were seasoned soldiers. Thaine looked down the line of less than a hundred men, McLearn, and Boehringer, Tasker, Goodrich, and Binford, all were in that line. He felt a thrill of soldier pride as he said to himself:

"We are fit. They have chosen us for the sacrifice. We'll prove ourselves." Then he thought of nothing else but duty all that day.

The capture of the first wall opened the way to a second with a paved court beyond it, and beyond that lay a third, and a fourth, and a fifth; wall and court, wall and court, through which and across which the American army forced its way by heaviest bombarding under heaviest fire, leaving a clean rear for the other armies to follow in. Only the sixth and last wall remained. General Chaffee's men had not failed. The flag of red, white and blue had led steadily on 'mid a storm of shells and a deluge of bullets.

One more onslaught and the last gates would burst wide open. Eagerly the American soldiers waited the command to finish the task. But it was not given. The leaders of the other armies had counseled together and prevailed against further advance, whether moved by military prudence or governed by jealousy of the ability of General Chaffee and the magnificent record of the American soldiers in the Orient, the privates could not know.

Just as the command to retire was sounded Japanese coolies had run with scaling ladders to the last wall. It was the supreme moment for Thaine Aydelot. He was only a private, but in that instant all the old dominant Cavalier blood of the Thaines, all of the old fearless independence of the Huguenot Aydelots, all the calm poise and courage of the Quaker Penningtons throbbed again in his every pulse-beat. He threw aside his soldier obligation and stood up a man, guided alone by the light within him.

"It is a far cry from the green Kansas prairies to the heart of old China," he declared to himself. "Yet, I'll go to the heart of that heart now, and I'll show the Stars and Stripes of a free people, so help me God!"

He turned and sped to the last wall, snatching the flag from a color-bearer as he ran. At the foot of the ladder the men holding it wavered a little. Thaine threw the flag up to a coolie who was already climbing.

"Take it up. If I don't get up, wave it there if you die for it," he cried as he sprang up the ladder behind the color-bearer.

The shots were thick about them as up and up they went until at last Thaine stood beside the indomitable little Japanese who had carried the American flag up the ladder.

Below the Kansas boy lay the holy city of an ancient civilization in all its breadth of ingenuity and narrowness of spirit. Standing there, a target for every gun, waving the Star-Spangled Banner out over that old stronghold, he cried:

"This is the end of the wilderness! Look up and see the token of light and hope and love. Other hands than mine will bear them to you, but I have shown you their symbol. I, Thaine Aydelot, of Kansas, first of all the world, have dared to stand on your most sacred walls with Old Glory in my hand. Wherever its shadow falls there is life, liberty and the pursuit of happiness. In God's good time they

will all come to you in peace as they have come to you now in warfare. Mine today has been the soldier service, and mine today the great reward."

CHAPTER XXIV.

The Call of the Sunflower.

Sons and daughters of the prairie,
Dreaming, dreaming,
Of the starry nights that vary,
Gleaming, gleaming!
You may wander o'er your country
where the vales and mountains be,
You may dwell in lands far distant, out
beyond the surging sea.
But ah! just a yellow sunflower, though
across the world you roam,
Will take you back to Kansas and the
sun-kissed fields of home.
—Nancy Parker.

THAINE AYDELOT sat with Doctor Carey and Pryor Gaines in the latter's home in the Foreign Compound in Peking. "I have done my work here," Pryor was saying. "I have only one wish—to go back to old Grass River in Kansas and spend my days with Jim Shirley. We two will both live to be old because we are useless; and Leigh will be marrying one of these times, if the Lord ever made a man good enough for her. So Jim and I can chum along down the years together."

"It is the place for you, Pryor," Doctor Carey asserted. "And now that the ranch is making money while Jim sleeps, you two will be happy and busy as bees. Every neighborhood needs a man or two without family ties. You'll be the most useful citizens in that corner of the prairies. And think of cating Jim Shirley's cooking after this."

"And you, Thaine? What now?" Pryor asked as he looked fondly at the young battle-tried soldier.

"I have done my work here," Thaine quoted his words. "I've only one wish—to go back to old Grass River in Kansas to take my place on the prairie and win the soil to its best uses; to do as good a work as my father has done."

Thaine's dark eyes were luminous with hopefulness, and if a line of pathos for a loss in his life that nothing could fill had settled about his firm mouth, it took nothing from the manliness of the strong young face.

"And you, Carey?" Pryor asked.

Doctor Carey did not reply at once. A strange weariness had crept over his countenance, and a far-away look was in his eyes. The man who had forgotten himself in his service for others was coming swiftly toward his reward. But neither of his friends noted the change now. At last he said:

"Years ago I loved a girl as I never could care for any other girl. She would have loved me sooner or later if something hadn't happened. A message from the man she cared for most fell into my hands one day long ago; a withered flower and a little card. I could have kept them back and won her for my wife, but I didn't. I sent the message to her by a servant boy—and she has been happy always in her love."

Doctor Carey turned his face away for the moment. Thaine Aydelot's eyes were so much like Virginia Thaine's to him just then. Presently he went on:

"Sometimes the things we fail to get help us to know better how to live and live happily. You will not be a coward, Thaine, when you come, year by year, to know the greater wilderness inside yourself. You will go back to the prairies where you belong, as you say, and you will do a man's part in the big world that's always needing men."

Thaine recalled the evening hour when he and Leigh were on the Purple Notches and he had declared in the pride of his nineteen years that he wanted to go out into the big world that is needing men and do a man's part there.

"If the big world needs men anywhere, it is on the old prairies," he declared, and the doctor continued: "I have found my future already. I shall not leave China again. Grass River may miss me as a friend, but not as a doctor of medicine. Doctors are too plentiful there. My place is here henceforth, and I'm still young. I came to the Philippines to be with Thaine"—Horace Carey's voice was low, and the same old winning smile was on his face—"because I love the boy and because I wanted to protect him if it should be my fortune to do it. I saved him from the waters of the Rio Grande and helped to pull him out of the hospital at Manila. He doesn't need me now, for he goes to do a big work, and I stay here to do a big work."

"Out of love for me alone?" Thaine asked affectionately, throwing one arm about Horace Carey's shoulder.

"No, not you alone," Carey answered frankly, "but because something in your face always reminds me of a face I loved long ago. Of one for whose sake I have cared for you here. You are going home a brave man. I believe your life will be full of service and of happiness."

The silence that followed was broken by Pryor Gaines saying:

"All this time—such a tragical time—I have forgotten, Thaine, that I have a message for you, a little package that reached here late last May. It was sent to me because the sender thought you were coming to China soon, and I was asked to keep it for you. You didn't come, and mails ceased to leave Peking—and then came the siege, the struggle to keep up the defenses, the sickness, the starvation, the deaths, the constant attacks, the final sight of Old Glory on the outer walls, and your triumphal entry through the sewer. You see why I forgot."

He took a little package from his writing desk and gave it into Thaine Aydelot's hand.

The young soldier tried to open it with steady fingers, for the address was in a handwriting he knew well. Inside a flat little box was a card bearing the words:

To Prince Quippi, Beyond the Purple Notches.

And underneath that lay a withered little yellow sunflower.

Two evenings later as the three men sat together, Horace Carey suddenly gripped Thaine's hand in his, then sank back in his chair with eyes that seemed looking straight into eternal peace; and the same smile that had won men to him seemed winning the angels to welcome him heavenward. In the midst of his busy, useful years his big work was done.

The sunflowers were just beginning to blossom along the old Grass River Trail. The line of timber following every stream was in the full leafage of May. The wheat lay like a yellow-green sea over all the wide prairies. The breeze came singing down the valley, a morning song of gladness.

Leigh Shirley had come up early to the Sunflower Ranch to spend the day and night with Virginia Aydelot, while Asher and her uncle Jim took a two days' business trip to Big Wolf with Darley Champers. Jim had brought Virginia a big bunch of exquisite roses which nobody but Jim Shirley could ever have grown to such perfection.

Virginia went into the house to find the tall cut-glass vase Doctor Carey had sent to her when he started West, while Leigh went to the gate of the side lot to pet a pretty black colt that whinnied to her.

"You beautiful Juno!" she cried, patting the creature's nose. "Mrs. Aydelot says you are as graceful and well-bred as all your grandmothers have been since the time a Juno long ago followed a prairie schooner down the old Grass River Trail to a little sod shack on a treeless claim in the wilderness. This is too fine a morning to go indoors," she added as she came back to the front lawn to the seat under the fragrant white honeysuckle.

She was as sweet as a blossom herself this morning, with her soft brown-gold hair waving back from her face, and her blue eyes full of light.

Somebody had turned from the road and was coming up the walk with springing step. Leigh turned her head to see who it might be, as she reached for a spray of the fragrant honeysuckle, and found Thaine Aydelot standing before her.

With a glad cry, she dropped the blossoms and sprang to her feet.

"Prince Quippi couldn't come nor write, so he sent me. Will I do for an answer, Leighlie? I was coming back to the blessed old prairies, anyhow; to my father and mother and the life of a farmer. I have come to see at last through Asher Aydelot's eyes that wars in any cause are short-lived, and, even with a Christian soldiery, very brutal; that after the wars come the empire-makers, who really conquer, and that the man who patiently wins from the soil its hundredfold of increase may be a king among men. I can see such big things to be done here, but, oh, Leigh, are you sure you want me here?"

Thaine was holding her hands in a gentle grip, looking with love-hungry eyes down into her face.

"I've always been sure I wanted you," Leigh said softly, "and I've always hoped you would come back here to the prairies again. But, Thaine, I'm so proud of you, too, for all the heroic things you have helped to do in the Philippines and in China. I am glad now you did go for a while. You have been a part of a history-making that shall change all the future years."

Thaine put his arm about her and drew her close to him as he said:

"Then we'll go and build a house on the Purple Notches, a purple velvet house with gold knobs, and all that yellow prairie away to the west that was only grass land four years ago we'll turn to wheat fields like Asher Aydelot's here. John Jacobs was holding that ground for somebody like you and me. We'll buy it of his estate. We'll show the fathers what the sons can do."

A thrill of happiness lighted Leigh's face for a moment, then a shadow fell over it as she said:

"Thaine, Darley Champers and I have kept a secret for a year."

"You kept it well. What was it?" Thaine asked gaily.

"Jane Aydelot, who died last year, left me all her property," Leigh began.

"Good for Jennie," Thaine broke in, but Leigh hurried on.

"I always knew she meant to do it, and that was one reason why I sent you away. I wouldn't have your money and I felt if you knew you wouldn't ask me for fear I'd think—Oh, money you don't earn or inherit squarely is such a grief," Leigh paused.

"So you wouldn't let me have any hope because of this junk in Ohio that you were afraid you'd get and I'd seem to be wanting if I married you, and you thought I ought to have and you'd seem to be marrying me to get. If I ever have an estate I'll leave it to foreign missions. I'd like to make trouble for the cuss that got me at the Rio Grande. Money might do it," Thaine declared.

Leigh did not laugh.

"You are right, Thaine. I was so unhappy about it all. For since I first came to Uncle Jim's I knew I ought not to have Miss Jane's love and the farm that you would have had if she knew you."

"You've known this all these years and never told even me. You silent little sub-soiler!" Thaine exclaimed.

"It grew in my mind from an almost babyhood impression to a woman's

If none of the above combinations suit you, you can make up your own club of papers in the following way: First select The Wisconsin Farmer and figure it at $1.00 per year. Then select any of the papers or magazines listed above and figure them at half their regular subscription price as indicated above, choosing whatever papers or magazines that appeal to you. As an example, suppose you should want The Wisconsin Farmer, Kansas City Weekly Star, Woman's World and People's Home Journal. You would figure The Wisconsin Farmer in the combination at $1.00; then you would add up the regular subscription price of the other three papers, which amounts to $1.10. Half of that amount equals 55 cents. Add this to the regular price of The Wisconsin Farmer, which is $1.00, and you would have a total of $1.55, which would be the rate for The Wisconsin Farmer, Kansas City Weekly Star, Woman's World and People's Home Journal.

If you wish to subscribe for any papers or magazines not listed in any of the above offers, write to us for special rates. Send all orders to Club Dept., The Wisconsin Farmer, Madison, Wis.

Beautiful Calendar FREE

with Your Choice of the Following Clubbing Offers

If You Send by JANUARY 25TH

Now is the time to secure your supply of reading matter for the coming year. We have carefully arranged the following combinations for your convenience and every offer is a big bargain. Each combination contains an entire year's reading for any family, and the prices are "rock bottom."

In addition you will receive a beautiful 1916 Popular Girl calendar if you send your order by January 25th.

The Popular Girl

calendar is a work of art, 9¼ inches wide and 33 inches long, beautifully colored. The picture was painted by the well known artist, Knowles Hare, Jr., and was posed for by a famous New York beauty.

Look them over: Everyone is a bargain. Use the coupon below and state the number of the offer you wish.

principle," Leigh declared. "I never thought of telling anybody. But there was another thing that kept me firm that day on the Purple Notches. Years ago, when I was a baby girl, I remember dimly seeing two men in an awful fight one night just at dusk down on the railroad track by Clover Creek in Ohio. I thought one of them was my father. Miss Jane would never tell me anything about it, and made me promise never to speak of it. So I grew up sure that my father had committed some dreadful crime, and, Thaine, until I knew better, I couldn't take the risk of disgracing your name, the proud name of Aydelot."

"Oh, Leigh, it is no matter what our forefathers do—they were all a bad lot if we go back far enough. It's what we do that counts. It's what I do as Thaine Aydelot, not as Asher Aydelot's son, that I must stand or fall by. It's how far we win our wilderness, little girl, not the wilderness our fathers won or lost."

Thaine was sitting beside Leigh now, under the perfumy white honeysuckle blossoms.

"But, Thaine, the bans are all lifted now."

Leigh sat with face aglow. "Your grandfather wouldn't let his property go to a child of Virginia Aydelot, so Miss Jane couldn't give it to you. She left it to me—all her property, provided, or hoping, I would—you should —" she hesitated.

"Yes, we should, and we will," Thaine finished the sentence. "Bless her good soul! I've always been rather fond of her, anyhow!"

"And Darley Champers found out that my father was accidentally drowned long ago in Clover Creek. Uncle Jim says he never could swim, and so that burden is lifted. But, Thaine, will you want to go back to Ohio to the Aydelot homestead? I could sell it for a club house to the Cloverdale Country Club, but I waited till you should come, to know what to do."

There was just a little quaver in Leigh's voice.

"Do you want to go back to Ohio?" Thaine inquired. "Unless you do, the country clubbers may have the place. There is no homestead there for me. This is my homestead. I want that open ranch-land beyond the Purple Notches. But, Leigh, if my father as administrator and trustee for John Jacobs' estate can sell me the ground and your inheritance from Jane Aydelot pays for it, what is there left for me to do, after all? I can't take favors and give none. I'll run away and enlist with the Regulars first."

A rueful look came over his face now, and behind the words Leigh read a determined will.

"The real thing is left to you," she replied, "the biggest work of all. You must go out and tame the soil. Your father bought his first quarter with money his father had left him by will, but he had no inheritance to buy all the other quarters that make the big Aydelot wheat fields of the Sunflower Ranch. If every acre of the prairie was covered with a layer of eastern capital, borrowed or inherited, it would not make one stalk of wheat grow nor ripen one ear of corn. But you may turn up the soil with your plow and find silver dollars in the furrow. You may herd cattle on the plains, and their dun hides will bring you cloth-of-gold. You may seed the brown fields with alfalfa and it will take away the fear of protest or overdraft, as the Coburn book says it will. I know, because I've tried and proved it. Oh, Thaine, with all your grand battles in the East which is always our West, Luzon is still a jungle and China isn't yet in the light. You have only prepared the way for the big things that are to follow. I never hear the old civil war veterans telling of their achievements in a grand army meeting without wishing that, after the great story is told, the grand army of the prairies would tell their tale of how the men and women fought out the battles here with no music of drums nor roar of cannon, nor bugle calls, nor shoulder straps, nor comradeship, nor inspiring heroic climaxes, and straight, fierce campaigns to victory. But just loneliness, and discouragements, and long waiting, and big, foolish-seeming dreams of what might be, with only the reality of the unfriendly land to work upon. I'm so glad you want to stay here and to take that open prairie beyond the Purple Notches for our kingdom."

The happiness in Leigh Shirley's eyes took from Thaine's mind the memory of all the hardship and tragedy of his two years on the battlefield. Her pride in his achievements, her joy in his return and her dream of their future together in a work so full of service, filled his soul with rejoicing, as the May morning opened for these two its paradise of youth and love.

Asher and Virginia Aydelot had come out on the veranda to look for Leigh. A moment they waited, then Asher said softly:

"He has forgotten us, but he has come back to the life we love."

"And he will come back to us tenfold more ours, because his heart is here," Virginia answered, and the two stole softly indoors.

"See the roses Jim brought; they seem to belong to that beautiful vase," Virginia said, as they stood at the door of the dining room. "I think Jim must have meant them for Leigh and Thaine."

"Yes, he brought us sunflowers in an old tin peach can wrapped with a newspaper, and we had no mahogany dining room set and not so much cut-glass and china and silver in our cupboard, nor quite such a good rug on our hardwood floor," Asher replied.

"But we had each other and the vision to see all these things coming to us," Virginia said, as she looked up into her husband's face with love-lighted eyes. "I wonder where Jim is."

"Jim is present." Jim Shirley came in quietly from the side porch. "He prepared your wedding supper for you. He buried your first-born, and now he comes to give you a daughter. He's been first aid to the Aydelots all along the line, as he will hope to continue to be, world without end, and a little more."

The homestead on the Purple Notches looks out on a level land stretching away in an unbroken line to the far westward horizon. Broad fields of wheat grow golden in the summer sunshine, and acres of dark alfalfa perfume the air above them. With a clearer vision of what reward farm life may bring for him who goes forth and earns that reward, the man whom the Tondo road made a soldier, Caloocan a patriot, and Yang-Tsun a Christian, has found in the conquest of the soil a life of usefulness and power.

And the father and mother, Asher and Virginia Aydelot, who, through labor and loneliness and hopes long deferred, won a desert to fruitfulness, a wilderness to beauty—these two, in the zenith of their days, have proven their service not in vain, for that they have also won the second generation back to the kingdom whose scepter is the hoe.

Not in vain did the scout of half a century ago drive back the savage Indian from the plains; not in vain did Funston and his "Fighting Twentieth" wade the Tulijan and swim the Marilao; not in vain did Chaffee's army burst the gates of Peking, nor Calvin Titus fling out Old Glory above its frowning walls.

Behind the scout came a patient, brave-hearted band of settlers who, against loneliness and distances and drouth and prairie fire and plague and boom, slowly but gloriously won the wilderness. Into the jungles of Luzon will go the saw and spade and spelling book. Upon the Chinese republic has a new light shined.

Not more to him who drives back the frontier than to him who follows after and wins that wilderness with sword re-shaped to a plow-share does the promise to Asher of old stand evermore secure!

Thy shoes shall be iron and brass; and as thy days, so shall thy strength be. The eternal God is thy refuge, and underneath are the everlasting arms.

The End.

The Wisconsin Farmer is anxious to get letters from Wisconsin farmers telling of their experiences. Readers are interested in what their neighbors write and the neighbor will also be interested in your communication.

PROFESSIONAL Veterinary advice through this department to regular subscribers only. We do not answer veterinary inquiries for the benefit of "neighbors." Parties desiring information will be required to send their names in full with their address. No question will be answered by mail unless accompanied by a fee of one dollar. In order that correct information may be given, the symptoms should be accurately described, stating of how long standing, together with color and age of animal, and what treatment, if any, has been resorted to. Thoroughly good and reliable veterinary remedies are advertised from time to time on these pages. If they were not good and reliable they could not appear in our paper. Our readers are requested to look them over. You may find here some remedy which will exactly fit your case. All veterinary inquiries should be addressed to this office.

AILING ANIMALS.

Simultaneously Treated Hog.

Please let me know how long after a hog has the double treatment before he can be put with safety into a herd that is not immuned. Also how long is a hog immuned by giving him the single treatment?

A simultaneously or double-treated hog should not be placed with a herd that has not been treated for thirty days following the date of such treatment. It is safe to place such an animal with an untreated herd after this length of time provided the treated hog has not been sick within the thirty-day period. The single treatment usually protects the hog for about six weeks. Young pigs are protected for a shorter period and older shoats and hogs are sometimes protected for a longer time. The average length of immunity produced by the single treatment is about six weeks.

Thumps.

I am asking for information in regard to thumps among hogs. I have lost three head of fine spring shoats with thumps.

This condition usually indicates indigestion due to overfeeding or to faulty feeding. When such is the cause of a lessened ration or a change of feed usually helps to correct it. At this time of the year many shoats are reported as thumpy or having died with the thumps, which on post-mortem examination show that the thumpy condition was a result of pneumonia. Medication of the hog for any condition is difficult and with the exception of giving laxatives when needed is seldom advisable. Careful feeding and housing, plenty of pure water and exercise usually correct these conditions.

Simultaneous Treatment.

Please publish what is meant by simultaneous treatment and how the treatment is administered with reference to hogs.

The simultaneous treatment of hogs to produce immunity against hog cholera means the application or injection of anti-hog cholera serum and cholera virus at the same time. The treatment is administered by holding the hog in such position as to render the inside of the hams or the arm pits accessible for cleansing and injection. These are the usual points selected for the injection of the serum and virus. They are first cleansed thoroughly with a disinfectant solution, preferably a 3 per cent solution of compound cresol, after which the serum is injected into the hams or injected into the opposite ham or axillary space. The virus is then injected into the opposite ham or axillary space. The dose of serum and of virus varies with the weight of the hog, usually 45 to 50 cc of serum and 2 cc of virus for a 100-pound shoat.

Spavin.

I bought a horse a short time ago that has a swelling on her hind leg. One side is soft and puffy, but the other side is hard. She isn't lame, but I fear she will get lame in time. The swelling has been there four years or more. She is seven years old. I don't think very much has been done for it though something may have been put on it some time. I am of the opinion it is a spavin.

Your suggestion of spavin may be the correct diagnosis of the swelling. If the mare has had this swelling for four years without going lame it is not likely she will develop lameness from it now without an injury to the part. Your description of a soft and a hard portion indicates both bog and bone spavin. Should the mare become lame you could probably overcome it by the application of some blistering agent, such as cantharides ointment or liniment. A preparation of iodine and mercury is also useful. However, the best treatment is the use of the firing iron. In case one firing does not overcome the lameness it should be repeated. This operation should be attempted only by a competent veterinarian.

Shoe Boil.

My mare has shoe boils on both front legs. They came about four weeks ago while we were working her on binder. One bunch went away, but the other broke open and matter kept running for about two weeks, which reduced the size greatly. It has now closed up and left a hard bunch. The mare is five years old and very valuable. She was shod at the time the boils came on, but had shoes removed right away and I do not think the shoes had anything to do with it.

Whenever a shoe boil assumes the character of a hard tumor such as you describe, it is best to resort to a surgical operation for its removal. Sometimes it is possible to reduce the swelling by application of blisters, followed by poultices, then by making free incisions and keeping the wound cleaned with an antiseptic solution, such as bichloride of mercury 1 to 1,000. You should not undertake the removal of the tumor surgically, but should call a veterinary surgeon for this operation.

Paralysis.

I have three little Berkshire pigs, six weeks old, which seem to be weak in their hind quarters. While they walk around they fall from one side to the other in back and sometimes drag themselves. They seem healthy otherwise, for they eat as well as others. What is the cause and remedy?

The description you give does not indicate cholera, but rather a failure to control the hind legs. There is nothing known definitely as the cause nor is a cure for it known as yet. Many experiments have been conducted to determine the cause and to find a cure for the condition, but without much success as yet. The following treatment has proven beneficial in many cases and is worth a trial: Tincture of nux vomica, two ounces; tincture of jalap, two ounces; tincture of myrrh, one ounce; Fowler's solution of arsenic, two ounces. Give each pig a teaspoonful three times daily in the swill. Feed no dry feed of any kind. Also give no corn. Oats soaked or bran mash or shorts will give better results. Tankage is also beneficial.

Mange—Scab.

I have two Holstein cows and they are getting bare spots on their bodies. The hair falls off. The cows seem to lick the bare spots until they bleed. What can I do to cure it? I think it is ringworm. I have noticed some of my cows have scabs on their legs and shoulders. Some scabs are larger than a silver dollar and some much smaller. What is the cause of the scabs and how can they be cured? Will the scabs go away without treatment? Is it a dangerous disease?

These conditions may be the common form or a more severe form of mange. You may be able to determine which form by placing some of the scab on a piece of dark or black paper and heating it in the sun or near the stove; after a while the little white mites may be seen crawling around. A magnifying glass would aid you in seeing the mites more distinctly. Should you discover these mites it would indicate the common form of mange.

The domodectic mange is more severe. It is quite common in some localities. It is caused by a parasite which lives in the hair follicles, producing pimples which render the hides less valuable. Treatment for demodectic mange is difficult and scarcely practicable.

Treatment for common mange should be by dipping in a lime and sulphur, a tobacco and sulphur, or carbolic dips. If lime and sulphur is used the dip should consist of eight pounds of lime, twenty-four pounds of sulphur, for each 100 gallons of water. The cattle should be dipped, not merely smeared.

To treat ringworm remove all crusts by washing with soap and water, then apply acetic acid, sulphur ointment, or tincture of iodine once a day. Cleanse the stable and whitewash it to destroy the spores scattered by the crusts.

Paralysis of Bladder.

I see through your valuable paper many good remedies for farm animals. I have a six months colt that from birth does not close its bladder properly and there is slight constant drain of the urine, which causes an irritation of the fleshy parts. The colt is as large and healthy as any colt of its age, except this. It is a mare colt.

Sometimes the bladder proper becomes paralyzed, but most often only the neck of the bladder. Paralysis of the neck of the bladder is characterized by inability to retain the urine which dribbles away as fast as it is secreted. The cause of this condition may be disease of the rectum, tumors growing within the pelvic cavity or injury to the spinal cord, etc. Treatment can be successful only when the cause of the troubles can be remedied. Blisters (mustard) on the loins may be helpful. You may also give internally one half dram of copaiba, or one-half dram tincture of cantharides daily. In case these fail the use of electric currents are recommended.

Knuckling or Cocked Ankles.

I have a colt coming two years old in the spring. About five months ago she began to get cocked ankles in front and now her ankles are drawn so far ahead that she stands on her toes, and her hoofs are becoming deformed. When I first noticed it she was running on blue grass pasture and I gave her three quarts of oats night and morning. I have been using a liniment composed of wood alcohol and witch hazel, recommended by a local veterinarian, but it doesn't seem to do any good. The cords seem to be drawn clear to her shoulders. There does not seem to be any fever or swelling.

From your description it would seem this case is so pronounced as to render successful treatment highly improbable. Your best course is to secure the services of a competent veterinary surgeon and have tendons divided between the fetlock and the knee. Firing and blistering usually are helpful when done in time. Proper shoeing also is of great benefit. This is accomplished by using a shoe with a thin toe and high heels.

In case these measures do not bring satisfactory results the destruction of the animal should not be delayed, as the condition would be too far advanced to respond to treatment.

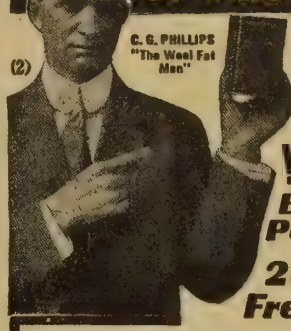
Diabetes, Sugar in Urine.

I would like some advice concerning a four-year-old mare. She has a scruff on her body that I cannot get rid of. She eats heartily of corn or oats. I feed her well and she has plenty of exercise, but her legs are usually swollen in the mornings, and if driven or ridden a short distance she puffs and pants as if short of breath. She does not sweat easily, but has a moisture on her hair of mornings, especially her neck. I have used a dip on her to get rid of the dandruff. It seemed to help a little at first, but is as bad as ever again.

It is impossible to definitely diagnose such a condition without making an analysis of the urine. However, diabetes is strongly indicated by the symptoms you describe. The liver is assumed to be at fault and treatment offered accordingly. The animal should be provided with a warm, sunny, well-ventilated stall or stable. You should give laxatives, such as sulphate of soda, one ounce, and carbonate of potassium, one-fourth ounce daily. You should also apply mild blisters over the region of the last ribs. The diet should be mainly bran mashes or middlings and milk, either skimmed or butter milk, in liberal quantities. A tonic made of nux vomica, twenty grains; powdered gentian, four drams, and phosphate of iron, two drams and administered daily with the feed should be beneficial.

When the war is over there will be a flow of emigrants to the United States and Canada if history is any criterion. And our northern neighbor plans to seize the opportunity to populate her prairie provinces. An estimate of possible farm lands in these provinces still available is placed by the Grand Trunk Pacific Railway at 272,892,000 acres, of which there are 105,217,000 acres in Alberta, 93,459,000 acres in Saskatchewan and 74,216,000 in Manitoba. At the time of the last official census of the dominion the land ocupied as farm land included 12,220,233 acres in Manitoba, 28,642,000 acres in Saskatchewan and 17,751,899 acres in Alberta. At the time of the taking of this census the percentage of arable land under cultivation or occupied as farm lands in the three provinces showed a total of over 55,000,000 acres and it was then estimated that of the land still vacant the arable would be 50 per cent in Manitoba, 60 per cent in Saskatchewan and 65 per cent in Alberta.

I Want to Send Every Reader of This Paper a Big Can of CORONA WOOL FAT By Mail—Postpaid—on 20 Days' Free Trial



I don't even ask you to risk a penny for postage. I want to prove to you before you pay and at my risk, that Corona Wool Fat is the greatest healing compound ever used on the farm for all kinds of hoof and skin diseases. Produced from the skin and wool of the sheep, this great natural remedy has no equal as a cure for Hard and Contracted Feet, Mud Fever, Split Hoofs, Corns, Grease Heel, Thrush, Quarter Crack, Barb Wire Cuts, Galled Shoulders, Sore Teats of Cows, Ulcers, etc. It

Heals Without a Scar

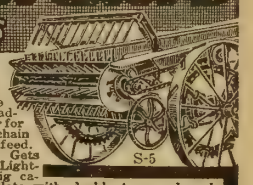
—grows hair over cuts and sores—makes new hoofs. Often worth hundreds of dollars by saving injured animals from lameness and permanent blemish.

Send No Money—I Pay the Postage

If you have never sent for a trial can, just drop me a postcard or letter saying you want to try Corona Wool Fat 20 days at my risk. Use it according to directions and when the 20 days are up if you find it does what I claim, send only 50c as payment in full—if you are not pleased, simply say so—I'll take your word for it and cancel the charge. Write today. Mention ailment you intend to use it on.

C. G. PHILLIPS, Manager
CORONA MFG. CO.
44 Corona Block, Kenton, O.

BIGGER CROPS Greater Profits



Prices slashed for mid-summer. Manure spreading time is all the time. You know this yourself. My new No. 8 Low Down manure spreader is my greatest spreader triumph—the best spreader for the least money. Double chain drive. Endless apron. Force feed. Front wheels cut under load. Gets into any corner. Close hitch. Lightest draft of any low down. Big capacity. All steel gear complete with double trees and neck yoke. Steel wheels. Gears coupled with channel steel, trussed like steel bridge. Box rests on steel trucks. 42 in. high. K. K. Foust, Ashley, Ohio, writes: "I saved $21.80 and got just what I was looking after."

MY BOOK "STREAK OF GOLD" FREE

Tells all about handling manure for greatest profit. Do not buy a spreader of any make at any price until you have asked for this great book worth $1.00 (costs you nothing) and my big special spreader catalog mailed free. Spreaders shipped from Chicago, Waterloo, Kansas City, Council Bluffs or Minneapolis.

12½¢ ECONOMY FENCE

Before you buy any more fence, write for facts about our 26-inch ECONOMY HOG FENCE at 12½c. per rod. Many other styles and prices.

Keystone Steel & Wire Co.,
5856 Industrial St. PEORIA, ILL.

LIVE STOCK NOTES.

Every person seriously engaged in the raising of bred-for-production live stock should be encouraged and protected in every way possible. "He is rendering a service to mankind by enabling himself and others to increase the production of their herds and at the same time reduce the cost to the consumer of very necessary human foods. He is making it possible to produce this food at a less cost, and by reason of the increased production return a greater profit to the producer.

R. M. Murphy, specialist in animal husbandry for the Tennessee College of Agriculture, recently inquired of the Wisconsin Live Stock Breeders' Association, concerning the whereabouts of carload lots of Short-horn cattle and Duroc Jersey hogs. He was immediately put in touch with breeders, and writes that he has already received a number of replies from Wisconsin stockmen which indicate that they have what he is looking for. Mr. Murphy is quite certain that Wisconsin will get the business.

O. E. Reed, dairy husbandman for the Kansas Agricultural College, came to Wisconsin recently and bought Guernsey and Holstein heifers and cows from various sections of the state to be shipped back to his state. Kansas is one of Wisconsin's best customers in the dairy cattle field.

A large dairy farm near New Germany, Minnesota, is negotiating with several of Wisconsin's community breeders' associations for the purchase of fifty head of bred Holstein heifers and a pure-bred Holstein bull.

Between August 1st and December 31, 1915, 437 double-deck carloads of sheep and lambs, more than 130,000 head, passed through the Edgerton sheep feeding yards. Edgerton is only five hours' run from Chicago and originally these yards constituted a feeding station where western sheepmen unloaded their stock for feed and rest before placing them on the Chicago market. This year foot-and-mouth quarantine conditions at the Union Stockyards in Chicago prevented the shipment of feeders back to the country. Live stock commission merchants and lamb and sheep feeders were seriously handicapped by this condition, but they were able to partly overcome the difficulty by filling orders from the Edgerton yards, creating a new phase of the sheep industry in Wisconsin.

C. C. Biederman, manager of the Edgerton plant, says that they have already booked for their winter feeding and shearing operations more than 40,000 head. They have a feeding capacity of 10,000 head at once, and can graze 25,000 head.

Grant county is to be still better known for its herds of profit-producing Short-horn cattle and its market-topping steers. That was decided at a meeting of stockmen recently held at the county seat, when the plans so successfully followed in many of the dairy districts of Wisconsin were adopted and will be put in full force in this section. A county Short-horn Breeders' Association, similar to the community dairy associations, has been organized and its members expect to make it a vital force in still further developing the beef cattle interests of southwestern Wisconsin. Similar organizations have recently been formed in Buffalo and Sauk counties. Oscar A. Hitt, of Alma, is secretary of the Buffalo county and Frank Horley, of Baraboo, of the Sauk County Short-horn Breeders' Association. Former Assemblyman George Carpenter is the president of the Sauk County Club.

Carleton College, Northfield, Minnesota, is starting herds of both pure-bred Holsteins and Guernseys. The object is to supply the dormitory tables with pure dairy products and incidentally furnish labor for needy students who are working their way through college. They recently purchased the well-known Guernsey show bull, Victory of Sarnia, to head their Guernsey herd. This bull was one of the Wisconsin animals to win fame for the state by winning grand championship honors outside of the state in 1914. He was grand champion at Indiana, North Dakota and Memphis, Tennessee state fairs that year.

Jean DuLuth Pear, a Red Polled cow owned by the Jean DuLuth Farm in Minnesota, recently completed a yearly record of 16,598 pounds of milk, containing 707 pounds of butter fat, under a test directed by the Red Polled Cattle Club of America. This cow is a half sister to Protor Knott, probably the most famous living Red Polled bull in America. Both animals were bred by J. W. Martin, Gotham, Wisconsin, and were sired by Corporal, perhaps the greatest sire of the breed ever known in this country.

J. R. Danks, who is now doing field work for the animal husbandry department of the University of Wisconsin, judged the Jersey and Guernsey classes at the Pacific International Live Stock Show at Portland.

Three carloads of high-grade Holstein heifers were recently purchased and shipped from Rosendale in Fond du Lac county to Montana. They were purchased by the well-known Hereford breeder, A. B. Cook, who expects to use them as nurse cows for his Hereford calves.

R. G. Murphy, a graduate of the short course in agriculture at the University of Wisconsin, who has been herdsman of well-known Guernsey farms, has rented the celebrated Bell Vernon Farm, Willoughby, Ohio, and will continue there the breeding of pure-bred Guernsey and produce high-grade milk for the Cleveland market.

SUCCESSOR TO MURPHY IN WALWORTH COUNTY.

L. L. Oldham has been appointed by the regents of the university as county agent for Walworth county. He succeeds J. H. Murphy, who has resigned to act as manager of a large stock farm in the same county.

Mr. Oldham has been employed in agricultural extension work for the Great Northern Railway and later was manager of a large farm owned by James J. Hill. He is a native of Dane county, Wisconsin, and a graduate of the University of Wisconsin.

The position of county representative in Walworth county carries much responsibility, as this region is one of

L. L. OLDHAM.
County agricultural agent succeeding J. H. Murphy in Walworth county.

the best developed agriculturally of any in Wisconsin and the farms are largely equipped in modern style and operated according to the best methods. Dairying and other live stock raising predominate.

Upon the recommendation of a committee representing the Sawyer county board the regents named C. P. West as agricultural representative of that county. Mr. West has specialized in the marketing of farm crops, having visited Denmark and Norway for the purpose of studying methods of farming carried on in these countries.

OUR NEXT SERIAL

"Hepsey Burke," a Sister to David Harum.

Written by the brother of the man who wrote the original, the most interesting and best selling book of the last 30 years.

Did You Ever Read "David Harum?"

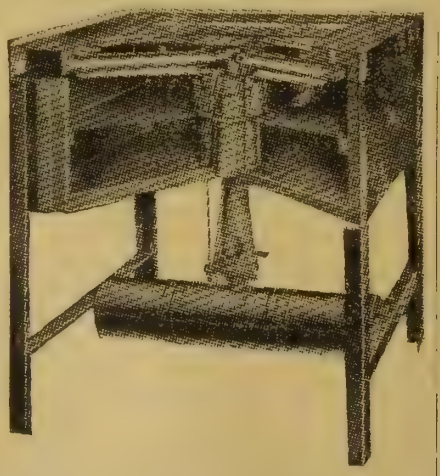
If so, you will not want to miss a page of "Hepsey Burke." If not, you will enjoy your introduction to the family. In either event you have a big treat in store, for "Hepsey Burke" is far and away the best serial ever run in any farm paper.

We will begin the serial publication of "Hepsey Burke" in these pages in two or three weeks.

Watch For Further Announcements

X-Ray Incubators.

MOST of our readers will recognize this X-Ray incubator—the incubator having fifteen special and individual features. The big special feature is the famous X-Ray Duplex heater, which knocks out all the cold corners in the X-Ray machine. The ingenuous construction of the heater overcomes the possibility of cold corners. Those pipes, or tubes, you see in the illustration convey a gentle heat to every point in the hatching chamber, diffusing this heat with positive certainty and absolute equality. Incubator men everywhere will appreciate the magnitude of this achievement. Equal distribution of heat has been the bugbear of manufacturers for years. The feat



is now accomplished in the X-Ray incubator. The X-Ray Company may well feel an immense gratification over the fact that they have attained a point close to perfection in their X-Ray Duplex heater. The new X-Ray vapor generator is a big feature, too. It's a fact that this generator actually duplicates the natural conditions found under the sitting hen. The heat, thanks to this generator, gets to the egg moisture laden. Heat from the hen's body, like that from any live body, is a moist heat. Dry heat is unnatural. Moist heat reduces the number of dead-in-the-shell chicks to a minimum. Then there's the X-Ray egg tray—another simple thing, and made simpler than ever in the X-Ray incubator. Listen, poultrymen, here's an egg tray that doesn't sag. You know what that means for egg protection, for making every inch of space available, for developing the chicks. Turning and airing the eggs in an X-Ray incubator is comparatively an easy matter. Equalized heat and a level tray—most extraordinary and most desirable to say the least. The X-Ray automatic trip is another special feature. Poultrymen will also be interested in the big X-Ray oil tank, which holds more than enough oil to make the entire hatch. The X-Ray hinged glass top means more than just an easy way to view the eggs. Glass makes a better deflector than anything else that could be used. It increases, intensifies and has a tendency to more evenly distribute the heat. The convenience of having eggs, chicks, thermometer and everything in the egg chamber so they can be seen at a glance is a convenience and a benefit that cannot be overestimated. The X-Ray construction is exclusive in many ways and takes a high place in the list of special features. Of course, only thoroughly dry California Redwoods are used. But the style of construction calls for special remark. The cover of the X-Ray incubator, to be specific, is the remarkable part. It is also the most costly individual part. Upon the accuracy and durability of the X-Ray cover depend the results of hatches—the success and profits they bring. The X-Ray Company takes especial pains with the construction of their cover. The precious heating device—X-Ray Duplex heater—which is really the heart and soul of the machine—is fastened firmly to this cover. When the cover is raised the radiator, the thermometer and part of the regulating apparatus is raised with it, and when the cover is closed down the central hood of the radiator telescopes down over the top of the flue, making a perfectly sealed connection. A very fine quality of insulating material is placed over this lid or cover. The X-Ray incubator by its scientific mechanism and excellent construction makes poultry raising a practical certainty. Get full information from headquarters. Drop a card bearing your name and address to the X-Ray Incubator Co., Des Moines, Iowa. See page 25.—Adv.

Personal to Our Readers.

ON page 7 of this issue appears an announcement of the opening of Louisiana lands to northern settlement by the Long-Bell Farm Lands Corporation. We direct the attention of our readers to this announcement not so much to call your attention to it from the standpoint of an advertisement, but to impress upon you the validity and integrity of this corporation, which is a sister corporation of the Long-Bell Lumber Company, which ranks as second most important manufacturer of lumber in the United States, if not in the world. When a company of this magnitude acts, with years of commercial integrity—whose standing in the world of finance is beyond comparison—this fact alone carries with it the assurance that anything contained in said agreement is capable of earnest and truthful consideration. With this end in view, this paper wants to assure its readers that it would not accept ordinary advertisements of this character where so much depends upon the co-operation of the company developing it, unless it felt assured that this corporation was amply able to carry out its promises made to prospective colonists or settlers.—Adv.

WISCONSIN HORTICULTURISTS MEET.

(Continued from page 10.)

very little against fungous diseases and recommended that the cherry grower always use Bordeaux instead. In Door county, he said, the best results have been obtained with Bordeaux.

One of the interesting addresses from the farmer's standpoint was that of E. H. Niles, of Oconomowoc, on "Plans for Farm Homes." Mr. Niles is a landscape architect and went into some detail as to advising the farmer how to lay out his grounds, choose the proper trees and shrubs, etc. There is no question as to the value to be derived from beautifying the farm home. What passer-by is not always attracted when he passes a home that sits like a picture among the trees, the shrubs and the flowers? The proper laying out of the grounds and the selection of the trees and shrubs has much to do with the after effect and Mr. Niles, whose paper we will publish in full in a later issue of The Wisconsin Farmer, went into all of these details. Miss E. M. Goelzer, of Oakwood, gave some valuable hints in her talk, "Just Flowers," pointing out the varieties which are hardy in Wisconsin, their habits, care needed, etc. Mrs. George Fratt, of Burlington, discussed, "The Home Garden," recommending that every farmer and every city dweller enjoy the comforts of a home garden. Lovers of dahlias were treated to a splendid talk on the new varieties by J. T. Fitchett, of Janesville, and C. A. Hofman, of Baraboo, discussed "Summer Flowering Bulbs."

The farmer and his fruit garden was very capably discussed by C. L. Richardson, of Chippewa Falls, who went into detail in explaining how a farmer could successfully have a fruit garden, give it the required attention and not make much time from other duties about the farm. Mr. Richardson favors an orchard and garden from a quarter to three-fourths of an acre, the length of which should be greater than the width to permit of free cultivation. At each end there should also be free turning spaces. In choosing the location the northeast slope is always preferable to the southwest slope, as this affords better winter and summer protection and this is an important factor which many orchardists and gardeners do not consider. The trees should be arranged in rows the long way of the plot, preferably north and scuth, and in the absence of local conditions to the contrary, the plums, being hardier, should be placed west of the apples. Currant and gooseberry bushes may be planted between the trees in the row and strawberries and raspberries in rows between the rows of trees. Mr. Richardson warns against crowding of trees. Twenty to twenty-four feet is close for apples, and eighteen to twenty feet for the plums. This gives room to plant two gooseberry bushes, three currants or a grape vine or two between trees. The strawberry bed he considers of first importance and 500 plants is not too many for the average farm. Cultivation once in two weeks or oftener until August is recommended in addition to hoeing four or five times in order to swing the runners into rows one to two feet wide. Mr. Richardson also went into other details of strawberry culture, such as mulching, etc., and said that any farmer, by giving such a patch the proper care, could make it pay him well.

H. M. Dunlap, of Savoy, Ill., owner of several hundred acres of orchards and well versed in orcharding conditions, gave one of the treats of the convention. Mr. Dunlap spoke upon "Commercial Orcharding in the middle West," in which he went into this matter at great detail, pointing out what must be done if the Wisconsin growers are to get the best returns from their orchards. He also discussed spraying and the farmer with an orchard that stands neglected through the spring and summer and at the mercy of insects would have realized quickly how he could improve his profits by hearing Mr. Dunlap's experiences. Spraying is one of the important duties of the orchard owner and if the trees and fruits are to be left to the ravages of the insect world the best fruit cannot be expected. William Toole, Sr., of Baraboo, told of the beauties of Wisconsin and said that with the beautiful landscape with which nature has endowed Wisconsin that it should become, with the help of man, the most beautiful state in the world. Wisconsin has lakes, rivers, valleys, hills and everything to make it a beauty spot and he urged every farmer and every farm home to lend to the improvement of this natural landscape by beautifying their homes and farms.

John Howie, of Waunakee, and C. O. Ruste, of Blue Mounds, spoke on the farmer and the farm orchards and Prof. Thomas Bewick, who is in charge of the boys and girls' club work in the state, urged that every farm boy and girl be interested in growing berries and fruits. Mr. Bewick told of plans for the exhibit next year at the state fair and predicted the greatest showing of boys and girls' club work ever seen in the United States. This work the association will assist with prizes, etc.

"The Codling Moth" was discussed very capably by Prof. H. F. Wilson, who succeeded Professor Sanders at the college of agriculture. Arsenate of lead is now the standard spray for combating the codling moth and Mr. Wilson said that the following practice should prove satisfactory in cases of spraying:

1. Never spray when your engine is running under 150 pounds pressure.
2. A forceful spray, whether driving or mist, is absolutely essential for thorough work and penetration to all parts of the tree.
3. A driving spray should be used for the calyx application in order to reach the inner cup.
4. A mist spray, being more economical than the driving and just as effective, should be used for later applications.

Unsuccessful control of the codling moth he said may usually be found due to one or more of these factors:

1. Lack of personal supervision of the actual spraying operations.
2. Inefficient spray outfits.
3. Careless application of spray and lack of thoroughness.
4. Lack of knowledge of the habits and life history of the insect.

Secretary Cranefield reported that experiments with trial orchards had proved that only the hardiest apples, such as Duchess, Longfield, Malindas, Hibernal and Charlamoff can be grown successfully in Upper Wisconsin, excepting certain portions of Bayfield and Door counties. Cherries cannot be fruited at all north of the forty-fifth parallel and only native plums will respond to cultivation. President Rasmussen in his report recommended a larger state appropriation and the solving of the marketing problem. "A home garden and orchard on every farm, but no farm on orchard on any farm," he suggested as a much-needed slogan.

The present officers, excepting three members of the executive committee, were re-elected. The official board for the coming year follows:

N. A. Rasmussen, president, Oshkosh.
D. E. Bingham, vice president, Sturgeon Bay.
L. G. Kellogg, treasurer, Ripon.
F. Cranefield, secretary, Madison.

EXECUTIVE COMMITTEE.

N. A. Rasmussen, Ex-officio.
D. E. Bingham, Ex-officio.
L. G. Kellogg, Ex-Officio.
F. Cranefield, Ex-officio.
1st Dist., H. C. Melcher, Oconomowoc.
2d Dist., R. J. Coe, Ft. Atkinson.
3d Dist., J. A. Hays, Gays Mills.
4th Dist., Henry Wilke, Milwaukee.
5th Dist., C. V. Holsinger, Wauwatosa.
6th Dist., H. C. Christensen, Oshkosh.
7th Dist., Wm. Toole, Sr., Baraboo.
8th Dist., C. M. Secker, Tomah.
9th Dist., A. C. Greaves, Sturgeon Bay.
10th Dist., C. L. Richardson, Chippewa Falls.
11th Dist., J. F. Hauser, Bayfield.

In the fruit exhibit J. S. Palmer, of Baraboo, won first for best collection of apples; Fremont Lounsberry, of Watertown, second; Rudolph Schultz, of Lake Mills, third, and Balghein Bros., of Twin Bluffs, fourth. Mr. Palmer also won first for the best five plates; A. D. Brown, of Baraboo, second; J. E. Baer, of Baraboo, third, and A. N. Kelly, of Mineral Point, fourth. In pecks the following first awards were announced:

Fameuse—Ludwig Bethke, Richland Center.
Gano—J. E. Baer, Baraboo.
Gem—A. D. Brown, Baraboo.
Golden Russet—H. C. Melcher, Oconomowoc.
Grimes Golden, Jonathan and McIntosh—Ludwig Bethke.
Northwestern Greening—J. E. Baer.
Tolman—J. S. Palmer, Baraboo.
Wealthy—J. W. Roe, Oshkosh.
Windsor—H. R. Platt, Baraboo.
Wolf River—J. E. Baer.
Salome—Rudolph Schultz.

First prize for the best seedling apple was awarded to Fremon Lounsberry.

The first winners in the plate displays were:

Ben Davis—Theodore Kurtz, Cedarburg.
Fameuse—Balghein Bros., Twin Bluffs.
Gano—J. E. Baer, Baraboo.
Gem—A. D. Brown, Baraboo.
Gideon—J. W. Roe, Oshkosh.
Golden Russet—Theodore Kurtz, Cedarburg.
Grimes Golden—Ludwig Bethke, Richland Center.
Jonathan—Fremont Lounsberry, Watertown.
Longfield—H. H. Harris, Warren.
McIntosh—Ludwig Bethke, Richland Center.
McMahan—Ludwig Bethke.
Newell—H. H. Harris, Warren.
Northern Spy—Theodore Kurtz, Cedarburg.
Northwestern Greening—N. A. Rasmussen, Oshkosh.
Patten—H. C. Melcher, Oconomowoc.
Pewaukee—J. S. Palmer, Baraboo.
Salome—Rudolph Schultz, Lake Mills.
Seek-No-Further—J. S. Palmer, Baraboo.
Scot Winter—J. E. Baer, Baraboo.
Tolman—J. S. Palmer, Baraboo.
Twenty Ounce—Fremont Lounsberry, Watertown.
Utter—Rudolph Schultz, Lake Mills.
Wagener—Ludwig Bethke, Richland Center.
Wealthy—N. A. Rasmussen, Oshkosh.
Windsor—H. R. Platt, Baraboo.
Wolf River—H. H. Harris, Warren.
Imperial and Boiken—J. S. Palmer, Baraboo.

Much interest was shown in the students' speaking contest and many important subjects were discussed. First prize of $25 was awarded to Miss Dorothy Loomis on, "Does it Pay to Beautify the Farm;" second prize of $15 to C. B. Blosser on, "Birds in Horticulture," and third prize of $10 to J. E. Richardson on, "Orchard Winter Injury." James Sedgwick with a paper on, "The Orchard Police," was given fourth honors.

The closing day was devoted to the commercial side of horticulture and addresses were made by M. S. Kellogg, of Janesville; Charles Haralson, of Excelsior, Minn.; R. J. Coe, Lewis Post, Prof. J. G. Sanders, C. V. Holsinger, C. L. Richardson and H. C. Christensen. Cranberry culture was discussed by Charles Lewis, Jr., of Cranmoor; C. M. Secker, of Mather, and Miss Lydia M. Huych, of Cranmoor.

The marketing session proved very interesting and a discussion of this important point was participated in by F. Kern, manager Bayfield Peninsula Fruit Association, Bayfield; A. C. Greaves, manager Door County Fruit Exchange, Sturgeon Bay; C. M. Secker, sales manager Cranberry Growers' Association, Mather; G. H. Townsend, apple grower, Richland Center; C. V. Holsinger, horticulturist, Milwaukee County School of Agriculture, Wauwatosa; J. S. Palmer, apple grower and shipper, Baraboo, and others.

The Wheat Yield Tells the Story

of Western Canada's Rapid Progress

160 ACRE FARMS IN WESTERN CANADA FREE

The heavy crops in Western Canada have caused new records to be made in the handling of grains by railroads. For while the movement of these heavy shipments has been wonderfully rapid, the resources of the different roads, despite enlarged equipments and increased facilities, have been strained as never before, and previous records have thus been broken in all directions. The largest Canadian wheat shipments through New York ever known are reported for the period up to October 15th,

upwards of four and a quarter million bushels being exported in less than six weeks,

and this was but the overflow of shipments to Montreal, through which point shipments were much larger than to New York.

Yields as high as 60 bushels of wheat per acre are reported from all parts of the country; while yields of 45 bushels per acre are common.

Thousands of American farmers have taken part in this wonderful production. Land prices are still low and free homestead lands are easily secured in good localities, convenient to churches, schools, markets, railways, etc.

There is no war tax on land and no conscription.

Write for illustrated pamphlet, reduced railroad rates and other information to

Atwater's Duroc Gilt Sale.

THE annual sale of Duroc bred sows of L. F. Atwater, Bangor, Wis., will be held Tuesday, February 1st. These annual sales have become an event looked forward to by Duroc breeders throughout the middle West. The offering this year is of the same high quality as the animals which have won so consistently for Mr. Atwater at the leading state and county fairs in this territory. This year's offering more than ever before is made up of grand champion and prize-winning blood lines. There will be close to fifty head offered two-thirds of which are either daughters of Lee's Defender or out of daughters of this noted sire. He, it will be remembered was grand champion at the 1914 Wisconsin State Fair. The balance are daughters of Corrector, first-prize yearling at the 1914 Wisconsin State Fair, of Lucky Col. and Select Advancer. These are bred to Lee's Defender. The daughters and granddaughters of Lee's Defender are bred to Prince Illustrator, grand champion at the 1915 Wisconsin State Fair. He is by Model King by High Model by Golden Model and out of a King of Col. dam. The combination of these two grand champion boars is an offering that our readers should consider very carefully. The reputation that this herd has gained in the show ring gives added value to these animals and the development and type which they possess are proof that they will transmit the good characteristics which they have inherited. Mr. Atwater advises the writer that he will offer Lee's Defender at private sale. Here is an unusual opportunity to purchase a grand champion sire of outstanding individual merit. Catalogs giving breeding, pictures and description are now ready and will be mailed on application. When writing for catalog kindly mention The Wisconsin Farmer. See advertisement on this page.—Adv.

Trade Revival in Western Canada.

REPORTS come of a general trade revival in the prairie provinces of western Canada, including Manitoba, Saskatchewan and Alberta. The farmers in this section of the country are in good shape on account of the big crops this year. They have harvested a record crop of wheat which enriches them to the extent of about $400,000,000. Business is generally on the hustle in the western Canada country. Bank clearings have been the largest in history, exceeding in some weeks the banks of Montreal and Toronto. Grain shipments have been the biggest in the history of Winnipeg and the twin ports, Fort William and Port Arthur. The conditions of western Canada at the close of 1915 is one of optimistic prosperity. On page 35 of this issue will be found an interesting statement by George A. Hall, 125 Second street, Milwaukee, Wis., who is a Canadian government agent. Mr. Hall's advertisement tells something about the western Canada crops this year, and will be of interest. An illustrated pamphlet will be furnished to any of our readers upon request. Please mention this paper when you write to Mr. Hall.—Adv.

The Joys of Motorcycling.

A PERSON who has not tried it cannot begin to appreciate the joys of motorcycle riding or the zest and energy a spin in the fresh air puts into you. Motorcycles are a great convenience on the farm, too, and save many hours and dollars in running errands to the neighbors and in making hasty trips to town. With the basket attachment more than one member of the family can go at a time and while so very much cheaper, both in original cost and in operation, than an automobile, they are just as invigorating and as dependable. Harley-Davidson motorcycles are standards everywhere. They are built with three speed transmission, which enables them to climb the steepest hills with ease and gives a flexibility of speed control equal to the automobile. If you knew about a Harley-Davidson motorcycle you'd want one. You can find out all about it by writing for free catalog and other information which will be sent on request addressed to Harley-Davidson Motor Co., 1145 A. St., Milwaukee, Wis.—Adv.

Grundy's Bates' Milking Short-horns.

BATES milking Short-horn heifers and yearling bulls are advertised for sale on page 38 by A. T. Grundy, Oshkosh, Wis. These were sired by Beauty Duke E. 341325, that was by Oxford Duke E. and out of Beauty by Pennsylvania Duke. On his dam's side he traces to Janesville Champion Rose, a noted milk and butter producing cow. These heifers and bulls are out of daughters of Hillside Duke 302173 by Pennsylvania Duke and out of Little Maid 2d, also of the Janesville Champion, Rose family. It will be seen that these young bulls and heifers are therefore, richly bred along milking strains and their use in a herd will prove very valuable for improving the milking ability of the offspring. Big-type Poland China boars and gilts are also offered for sale.—Adv.

Kirkpatrick Brothers' Holsteins.

REGISTERED Holstein cows, yearling heifers and yearling bulls ready for service are advertised for sale on page 38 by Kirkpatrick Bros., Reedsburg, Wis. The yearling heifers and bulls are out of A. R. O. cows and were sired by a grandson of a noted bull, King of the Pontiacs, that has 164 A. R. O. daughters, nine with records above thirty pounds. Chester White boars and gilts are also offered for sale. For pedigrees and further information in regard to these animals write to the above address.—Adv.

Stubbs & Hyzer's Duroc Sale.

THE sale of Duroc bred gilts of Stubbs & Hyzer, West Salem, Wis., will be held Monday, January 31st. The offering is one of special merit on account of the choice breeding of the animals offered. It is largely an offering of daughters and granddaughters of the noted boar, King of Cols. This boar is one of the greatest transmitting boars of the breed. He has sired more noted prize winners than any other boar of the breed. There are also several daughters of Lee's Defender, grand champion boar at the 1914 Wisconsin State Fair. These gilts are bred to Lincoln's Model and King the Cols. Again. Lincoln's Model is an outstanding boar of Ohio Chief breeding. He himself won seven first and grand champion prizes at leading county fairs in Wisconsin this year and won second at Wisconsin State Fair against very heavy competition. Competent judges declared him to be one of the best boars on the grounds. The offering consists of thirty bred spring gilts and twenty aged and yearling sows. The sale will be held right in the city of West Salem, so that no driving will be necessary. The sale will be held in a heated, well-lighted sale pavilion, so that everything will be comfortable regardless of weather conditions. The railroad service is excellent to West Salem, it being on the main line of the C. & N. W. and C., M. & St. P. railroads. Trains leaving Portage or Madison Monday morning will get to West Salem in ample time for the sale. Catalog giving description, pictures and pedigrees are now ready and will be sent on application. When writing for catalog kindly mention The Wisconsin Farmer. See this page.—Adv.

B. W. Little's Durocs.

THE Duroc gilts advertised for sale on page 39 by B. W. Little, Janesville, Wis., are a fine lot of well-developed, choicely-bred individuals. Mr. Little has been breeding Durocs for a great many years and by careful selection and good management has built up a fine herd. He has always purchased sires of proven blood lines, using such good boars as sons of Defender, twice grand champion at the International, Advance a grand champion boar, Proud Advance a grand champion boar and others of equal merit. His present offering is of such foundation stock. They are out of daughters of Ohio King, Little Wonder and Defiance. They are bred for March and April farrow to Critic Top Col. half brother to the grand champion boar at the 1912 Nebraska State Fair, that also sired the grand champion boar at the 1915 Nebraska State Fair. Critic Top Col. is a son of the 1,000-pound boar, Dusty Critic 2d by Dusty Critic. His dam is Royal Belle, a granddaughter of Top Notcher Again, grand champion at the Illinois and Indiana State Fairs. It will be seen that the gilts offered for sale are of grand champion blood on both sides and that they carry litters sired by a boar of grand champion breeding. Mr. Little is also a breeder of Bates milking Short-horns and recently added a very valuable bull to this herd. He is a son of Oxford Duke 3d and out of 22d Duchess of Wapsie by Major Roughish Eyes. In this bull are combined the two great producing Wapsie and Oxford strains.—Adv.

McDonald's Poland Chinas.

THE Poland China herd of J. D. McDonald, North Bend, Wis., won sixty-one ribbons at the 1915 Wisconsin State Fair. This included three champions and one grand champion, as well as a large number of first prizes. Boars and sows of all ages are advertised for sale on page 39. These were out of big, prolific sows that weigh up to 800 pounds and had litters averaging ten pigs to a litter. Mr. McDonald is a careful, discriminating judge of Poland Chinas and in selecting breeding stock has shown excellent judgment. He has purchased animals of proven blood lines and of popular and well-known lines of breeding. Boars and sows not related can be furnished or sows bred for March and April farrow.—Adv.

Burn Brae Durocs.

THE Burn Brae Farm owned by Chas. A. Peterson, Rosendale, Wis., is the home of a fine herd of Duroc swine. Not only are the individuals well developed, but they are also backed by well-known and proven lines of blood. The gilts offered for sale on page 39 are daughters of Burn Brae's Distinction, Hazel Hurst Col. and Burn Brae's Model Col. They are bred for March and April farrow to Burn Brae's Golden Model. Several fine spring boars, weighing 275 pounds are also offered for sale. For further information in regard to breeding and description write to the above address. When writing kindly mention The Wisconsin Farmer.—Adv.

A Reliable Commission House.

YEARS of successful operation have made Clay, Robinson & Co., easily the live stock commission house of the country. With offices at every leading live stock market, backed up by the work of the most expert salesmen in every line of live stock they can be depended upon to give the customers the very last word in service and secure for them the top price. Clay, Robinson & Co. is essentially a house of service and responsibility.—Adv

Thompson's Holsteins.

TWO registered Holstein cows are advertised for sale on page 37 by Thomas A. Thompson, Argyle, Wis. One of the cows is just fresh and has a fine heifer calf at foot. The three head are being offered very reasonably and will prove a profitable investment. Mr. Thompson is also offering three high-grade cows that are due to freshen soon and registered bull calves sired by King Pontiac Pioneer, a grandson of the noted bull, King of the Pontiacs, that has 165 A. R. O. daughters.—Adv.

Metz & Sons' Percherons.

IMPORTED and home-bred Percheron stallions and mares are offered by S. Metz & Sons, Homewood, Ill., who announce they have a lot of two, three and four year olds with size, bone and quality on which they will make prices and terms right. They also have a fine good aged stallion for sale worth the money. See their advertisement on page 39 and write them, mentioning The Wisconsin Farmer.—Adv.

Klassy's Holsteins.

THIRTY-TWO pounds of butter in seven days was made by the dam of Sir Netherland Longfield, the sire of the young bulls advertised for sale on page 38 by J. C. Klassy, Monroe, Wis. These young bulls range from one to six months of age, are well marked and in nice growing condition. They are from heavy producing dams of choice breeding and good individual merit. For pedigree and description write to the above address.—Adv.

North's Holsteins.

REGISTERED Holstein heifers and bull calves from three to ten months old are advertised for sale on page 38 by John North, Kilbourn, Wis. These were sired by King Clover De Kol Burke and by Oak Homestead Fobes, whose three nearest dams average over thirty pounds of butter in

STUBBS & HYZER'S SALE

BRED DUROC GILTS AND SOWS

WEST SALEM, WISCONSIN

MONDAY, JAN. 31, '16

50 BRED GILTS AND SOWS sired by **King the Cols.**, the sire of more prize winners than any other sire of the breed; **King the Cols. 2d,** a son of King the Cols.; **Lee's Defender,** grand champion at the 1914 Wisconsin State Fair. These are bred for March and April farrow to **Lincoln's Model,** that won second at the 1915 Wisconsin State Fair. He is a richly bred Ohio Chief strain boar. Sale held in the city. No driving. Send for catalog. I. E. Stickelman, auctioneer. H. S. Hoard will represent The Wisconsin Farmer.

STUBBS & HYZER -:- WEST SALEM, WIS.

L. F. ATWATER'S GREAT DUROC

BRED SOW SALE

BANGOR, WIS., FEBRUARY 1, 1916

47 HEAD OF CHAMPIONSHIP CALIBER AND BREEDING

30 GILTS OUT OF BLUE RIBBON SOWS

These are sired by the great Lee's Defender, and their dams are the sows I won my ribbons on at the state fairs this last summer.

10 GILTS OUT OF LEE'S DEFENDER SOWS

Their sire is Select Advancer, he by Chief Select, a full brother to Cherry Chief. Here is breeding unexcelled anywhere.

5 GILTS BY CORRECTOR

He by Sensation Wonder and out of a Golden Model 2nd dam. These five are bred to Lee's Defender; they are sure grand champion stuff, as Lee's Defender and Corrector were twice awarded the purple ribbons.

2 GREAT FALL SOWS

Sired by Lee's Defender; their dam a full sister to the sow that won three grand championships at the big fairs in 1915. These two sows themselves were first and second and trophy winners at two of the big shows in 1915.

Remember, two-thirds of this offering bred to farrow in March. I. E. Stickelman, Auctioneer. H. S. Hoard, Wisconsin Farmer field man. Send for my Catalog today.

seven days. Mr. North is also offering a few high-grade Holstein cows and heifers. For pedigrees and description of these animals write to the above address.—Adv.

Burt Farms Durocs.

THE Burt Farms, Brodhead, Wis., owned by F. H. Burt & Sons, has long been famed as the home of good Durocs. A fine line of breeding has been established. The ideal of a profitable farmer's hog has been constantly kept in mind, combining size with quality. Great care in feeding and development is taken, using alfalfa pasture to give the exercise and protein for muscle and growth. Big type and big litters are the kind bred. In connection with this I want to mention that a very interesting booklet is issued giving a description of the boars and sows in this herd. It gives the size of litters and description of the animals in the litters. The boars now in service are Professor B., a grandson of the noted boar, Professor, a great boar whose influence in the breed has been of much value. Crimson Correct, a son of Corrector, first-prize yearling at the Wisconsin State Fair; Burt's Special, a grandson of Fancy Col. A fine lot of gilts are advertised for sale on page 39. These are bred for March and April farrow to Model Wonder 182445 by Jud King, first prize and grand champion at the 1915 Minnesota State Fair. For further information in regard to these animals write to above address.—Adv.

Mankato Incubators for $7.25.

THE Mankato incubator comes all set up, with its triple walls, asbestos lining, heavy, pure copper tank, safety lamp, tested thermometer, etc., already for use. It is made of California redwood and thousands in daily use are giving satisfaction everywhere. They cost only $7.25 and are backed by a strong guarantee. You can find out all about this unusual proposition by answering their advertisement on page 24 and writing Mankato Incubator Co., Box 708, Mankato, Minn., and mentioning this paper.—Adv.

Eighty Per Cent More Power in Hudson.

ANNOUNCEMENT of the Hudson Super-Six appears in this issue and it will be of very great interest to anyone who has any intention of looking over the automobile offerings. The Hudson car now offered has 80 per cent more power—seventy-six horse power to be accurate, and yet the price has been greatly reduced and the car has been made much more popular because of the added refinements. It is not necessary to coach the average car driver as to the advantages which may be gained by this added horse power. The Hudson people have employed the most experienced engineers which money has been able to buy and have been leaders in striking changes for the better in the beauty of their car. The Super-Six, an illustration of which may be seen below, is certainly a beauty and with the reduction in price becomes an exceptionally attractive automobile offering. This new car is large enough to go anywhere that a car can be expected to go. It has beauty and ease of motion and simplicity of control. It is indeed a luxurious car. Dealers in this state and vicinity will be glad to give demonstrations of this new car at any time. A list of dealers will be found in the advertisement on page 2. Please write to the Hudson Motor Car Co., Detroit, Mich., and ask for new catalog describing the Super-Six. Kindly mention this paper when you write.—Adv.

Parker's Cholera-Immune Durocs.

THE Duroc spring gilts advertised for sale on page 39 by E. H. Parker, Janesville, Wis., have been made cholera immune. Mr. Parker has been very successful in his treatment and has used it for several years. The gilts offered for sale are well grown, weighing 225 pounds or more. They are of good type, wide and deep throughout. In breeding they are of the best, for they were sired by Defender's Golden Model, a son of Lee's Defender, grand champion at the Wisconsin State Fair, both in 1914 and 1915. Some were sired by Wonder Boy by Marion's Wonder, grand champion at the 1912 Wisconsin State Fair. The dams of these gilts were daughters of Illustrator, the $2,000 grand champion at the Illinois State Fair. Dominant Col., the 1912 Illinois State Fair grand champion and daughter's of Lee's Defender and Marion's Wonder. Mr. Parker recently sold fifteen gilts and a boar to one

DAIRYMAID'S KING.

SIRE of the yearling Guernsey bulls advertised for sale on page 38 by M. L. Welles, Rosendale, Wis.

man, which is evidence that his gilts are of outstanding good type. For pedigrees and further information in regard to these animals write to the above address.—Adv.

Birchwood Guernseys.

THE herd of Guernsey cattle owned by M. L. Welles, Rosendale, Wis., is one of which any breeder might well feel proud. His herd numbers about seventy-five head of registered animals, all of which are choicely bred and of high individual merit. For the past eleven years semiofficial testing has been done every month with the exception of one month, so that practically every animal on the farm of milking age has an A. R. record. Mr. Welles is a careful, discriminating judge of good cattle and has developed an excellent herd. The sire at the head of the herd is Dairymaid's King, an outstanding bull of great size, capacity and constitution. He is full brother to the former world's record cow, Dairymaid of Pinehurst, the first cow of the breed at her age to make 910 pounds of butter fat in a year. His sire was Glenwood Boy of Haddon, that has twenty-six A. R. daughters. His dam was Dairymaid of Elmplace, that made 668 pounds of fat in a year. Dairymaid's King is not only backed by good production blood, but he has transmitted this ability to his offspring. He now has nine A. R. daughters. The cows in this herd are of equally choice breeding. There are a number sired by Penwyn 2d, a half brother to Dairymaid of Pinehurst and a number closely related to Masher's Sequel. The yearling bulls advertised for sale are well grown and from A. R. dams. They are being priced very reasonably and our readers should not overlook this opportunity if in the market for a herd sire. See advertisement on page 38.—Adv.

JERSEY CATTLE.

DAIRYMEN!

Is that great half of your herd, the sire, a half that will show thousands of dollars of profit? Or is he "just a bull"? Run no risks. Invest where you know the breed pays and where the registry stands for purity of type and special, concentrated purpose.

Buy a Jersey Bull

Introduce the blood that proves out in steady, persistent milk flow, in animals that mature early, live long, live anywhere, eat most anything and produce most economically, the richest of milk.

Get our free book "About Jersey Cattle," and plan now to build up a herd you'll be proud of.

The American Jersey Cattle Club
338 West 23rd Street - New York City

"Peaches and Cream" Horses are "Town Talk"

Horsemen—1916 is the **"Get Rich Quick"** year for **Horse Breeders** and **Stallioners.** Get into the **"Money-Making Game"** of Breeding Draft Horses. **Europe "dolls"** her **"War Cap"** to **U. S. Horses. Europe** buys **500 Horses daily of U. S.** (at $125 to $200). Europe will buy **"a MILLION"** Horses of U. S. You make **more "Easy Money"** in **Breeding Horses** than any other business for **next ten years.**

His 34 years of success in *Importing, Breeding* and Selling *5,640 registered horses*—his "50 trips" across the ocean—make Iams *a safe man* to buy *stallions from.* His *"old customers"* are *"best Page advertisers,"* his *Breeding Guarantee* backed by *"1-2 Milion Dollars."* *Iams' Imported* and *Home-bred horses* are *"classy, model big drafters"* of *large bone, fine form, quality, finish,* and *flash movers.* Several European

"Gold Medal and State Prize-Winners,"

"Iams' kind," and in the *"Pink of Condition."*

Bought at *"bargain prices"* and *must be sold.* *"Iams sells horses on honor."* A lady can buy as cheap as a man. *Iams is not in "stallion trust,"* and is *selling more pounds of "model of horse"* for the *money* than any *competitor. Iams* is *cutting the middle* out of *high prices* on his choice collection

OF PERCHERON AND BELGIAN STALLIONS AND MARES

2 to 6 years old, weight 1,700 to 2,410 lbs., all "Branded," "Approved," "Registered and Inspected" by Governments of France and U. S. and certificates "stamped" O. K. All "inspected" by a Nebr. Deputy State Veterinarian and certificates of "Health and Soundness" are given with each horse. Iams sells

IMPORTED STALLIONS AT $1,000 AND $1,400

(few higher). **"Home-Breds" come cheapest.** Registered 1,800 to 2,100-lb. mares at $700 to $1,000. **Terms cash, or one year's time at 7 per cent; land security at 6 per cent; $100 less price for cash than time. Iams pays freight and buyer's fare;** gives 60 per cent breeding guarantee. Can place $1,500 insurance. Iams backs up his ads. with a **$500 guarantee** that you find the horses as represented. Write for Horse Catalog. It has a "Big Bargain" on each page. References: First National and Omaha National Banks, Omaha, Neb.; Citizens State and St. Paul Banks, St. Paul, Neb.

ST. PAUL, NEB.

IMPORTERS AND BREEDERS OF

PERCHERON, BELGIAN AND CLYDESDALE STALLIONS AND MARES

WE now have in our barns more big-boned, rugged draft colts, from yearlings to 4 and 5 years, of the different breeds than ever before. We have two-year-olds that weigh over a ton—herd headers and show propositions.

Five farms over 1,000 acres devoted to the horse business. We do all our own buying and selling, grow all our own feed. Our economical way of handling stallions saves money for the purchaser. We guarantee all horses sold and can sell you a high-class stallion cheaper than any other firm in America.

We are located in North Central Iowa, 20 miles from the Minnesota line, on the C. M. & St. P. Ry., midway between Mason City and McGregor.

Send 20c in stamps for large Horse Hanger which shows our Main Farm and sales stables. Correspondence a pleasure. **We have a horse for every purse.**

FRANK P. SHEKLETON & SON, LAWLER, CHICKASAW CO., IOWA

There's A Reason Why Ferris Evergreens Grow Where Others Fail-Read My Guarantee

Buy Direct Save Half

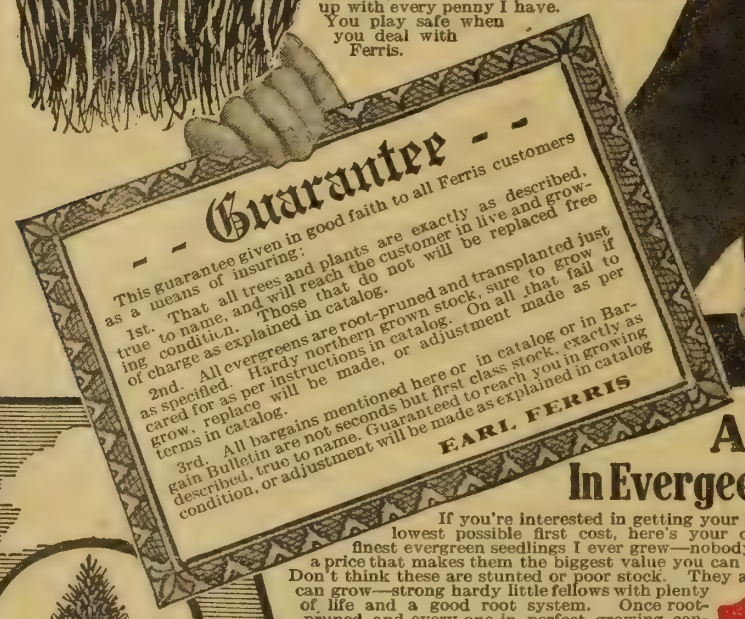
Why pay 30 to 50% more for your nursery stock than I ask for it? Why pay the agent's commission on trees when you can buy, direct from the nursery row, the finest ones ever grown at prices based right on the cost of production?

I sell my trees—evergreens and everything else—direct to you. I have no salesmen except my catalog and every penny you send me buys trees. There's no commission on them—you save that—and no big expense growing them—more saving **for you.** My price is based right on what it costs to grow trees and I can grow them as cheap as anybody. That puts my prices right down to bed rock and the wonderful value of my trees makes them the biggest bargains ever offered anywhere.

I grow my trees—remember that. I'm not a jobber—the Ferris trees I offer you are grown right here in my nursery. I know just what they are and I personally supervise the selection and packing of your order.

My Guarantee Read

Here's the biggest, broadest, best guarantee ever written on trees—a guarantee that makes you absolutely **safe.** Read it carefully and remember that I back it up with every penny I have. You play safe when you deal with Ferris.



LISTEN

I don't care where you buy or how, you cannot buy better trees than I am offering you. You'll never beat Ferris trees for quality—better ones don't grow. I know how to grow strong, hardy trees that are full of vitality—I've studied trees for forty years. Ferris trees will **grow for you**—they have the stamina and life in them that **insures** growth.

Special Bargains Here

Read carefully the bargain offers I'm making on this page. **You cannot buy more for the money anywhere.** They're special bargains for readers of my ads—order right from the ad. Don't overlook these big values. My great guarantee makes you safe. Mail your order today and save money on the finest stock that grows.

My Customers Call Me the "Evergreen Specialist"

My specialty is evergreens. I've learned how to grow them **right** by long experience and scientific study. Ferris evergreens are cultivated by modern methods and there are, today, no better ones grown than I can show you right here in my nursery.

For any man who wants a windbreak on his farm Ferris evergreens solve the problem. They will grow for you—for anybody. Hundreds of groves of my trees are now growing where the owners had despaired of getting evergreens to grow. My trees are root-pruned and transplanted until they have great masses of roots that will nourish the young tree in almost any soil. Note the pictures in the small circles. They show the development of the root system of a Ferris evergreen. It's these big masses of small roots that insure growth. That's the secret of sure-to-grow evergreens.

Yes, there is a reason why my trees grow. They grow because my knowledge and experience in evergreen culture enables me to grow stronger, better, hardier trees than other methods can produce.

A Bargain In Evergeen Seedlings

If you're interested in getting your windbreak started at the lowest possible first cost, here's your chance. I'm selling the finest evergreen seedlings I ever grew—nobody grows better ones—at a price that makes them the biggest value you can ever buy in seedlings. Don't think these are stunted or poor stock. They are as good as seedlings can grow—strong hardy little fellows with plenty of life and a good root system. Once root-pruned and every one in perfect growing condition. They'll reach you alive and will grow. You can't start a windbreak row any cheaper than with these Ferris seedlings. See our catalog for transplanting directions.

100 trees for $1.50

GET MY BIG CATALOG FREE

I want you to have a copy of the new Ferris catalog. It's a book you need if you are interested in nursery stock. Printed in colors. Gives you valuable suggestions about planting and caring for nursery stock. Write for the catalog and look over the big bargains I'm offering. You'll find something that will interest you. Most complete guide in planting and caring for nursery stock ever printed.

100 ROOT-PRUNED TRANSPLANTED EVERGREENS $4.50

Genuine, sure-to-grow, Ferris evergreens. Every tree perfect—not a weak one in the bunch. Strong—vigorous—hardy. These evergreens have big root systems—have all been root-pruned and transplanted until the strength of the tree is in the roots. They will grow in your windbreak row and grow fast because they have the vitality that makes growth sure. Biggest value offered.

Sold under the big, satisfaction-or-replace guarantee.

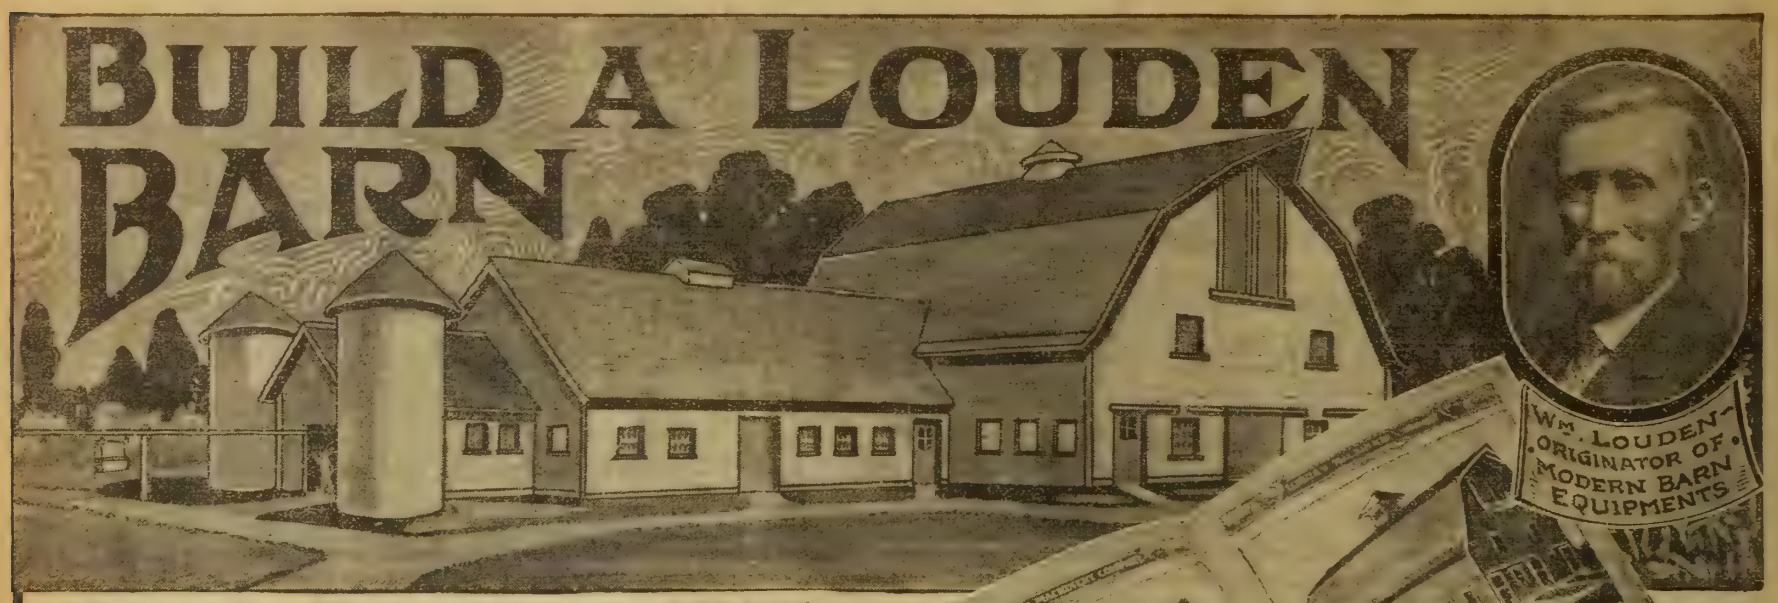
BUILD A LOUDEN BARN



BOOK OF BARN PLANS FREE

If You Are Going to Build a New Barn or Remodel an Old One You Should Have This Book

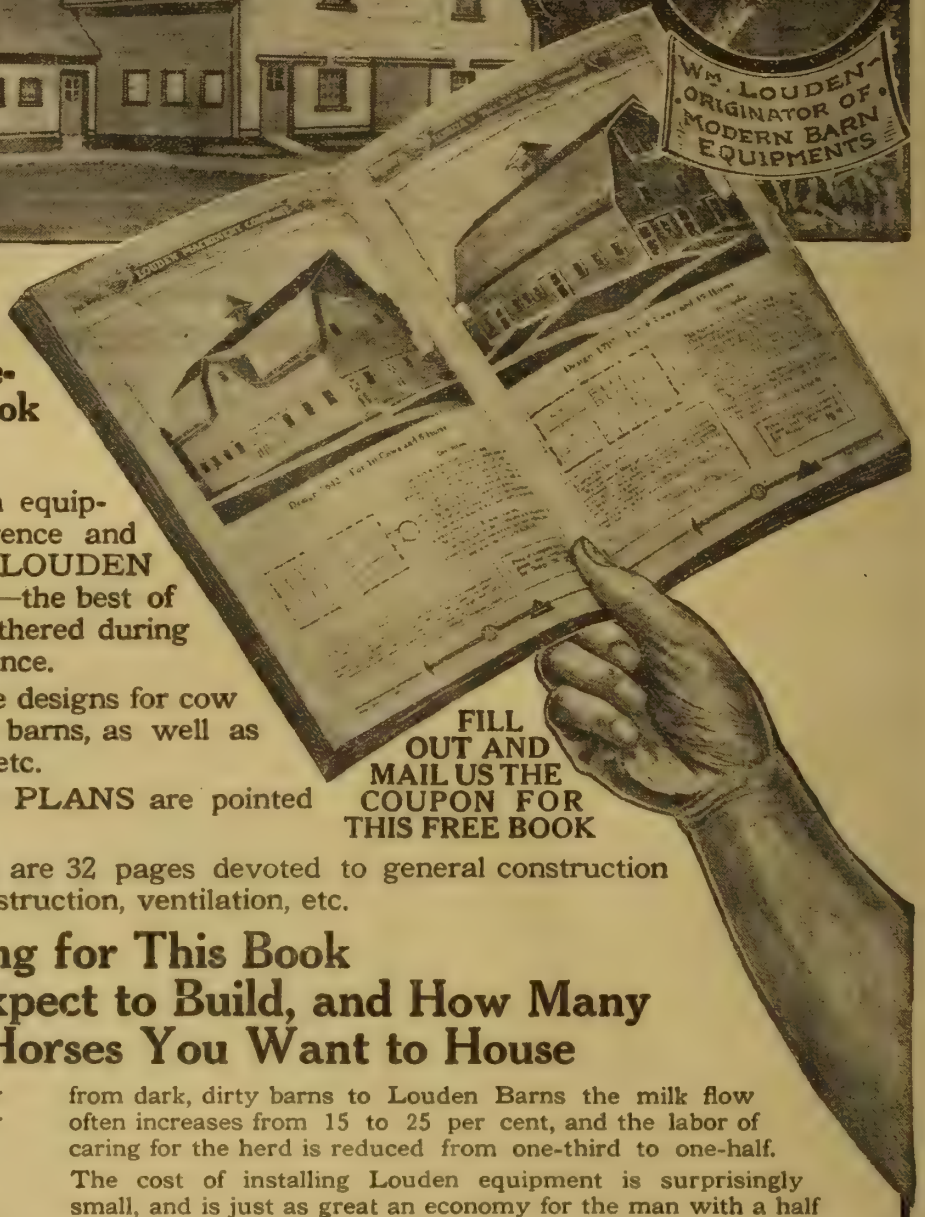
Why Not Build This Season?

LOUDEN BARN PLANS is not a catalog of barn equipment. It is a complete and valuable book of reference and instruction on barn construction. The 112 pages of LOUDEN BARN PLANS are full of dollar-saving information—the best of the building ideas that the Louden Company has gathered during 48 years of barn-building and barn-equipment experience.

LOUDEN BARN PLANS contains 51 representative designs for cow barns, horse barns, combination and general purpose barns, as well as many other designs for hog barns, pens, hay sheds, etc.

The advantages of each design in LOUDEN BARN PLANS are pointed out, and estimate of construction cost is given.

In addition to the barn plans shown in the book, there are 32 pages devoted to general construction problems, such as concrete work, laying floors, roof construction, ventilation, etc.



FILL OUT AND MAIL US THE COUPON FOR THIS FREE BOOK

When Writing for This Book Please State When You Expect to Build, and How Many Cows and How Many Horses You Want to House

WE HAVE DESIGNS FOR NEARLY 4,000 BARNS and our architects will give your letter personal attention if we learn your exact requirements.

LOUDEN BARN EQUIPMENT

Louden equipment makes possible a clean, sanitary barn with a minimum of expense for upkeep. When cows are transferred from dark, dirty barns to Louden Barns the milk flow often increases from 15 to 25 per cent, and the labor of caring for the herd is reduced from one-third to one-half.

The cost of installing Louden equipment is surprisingly small, and is just as great an economy for the man with a half dozen head of stock as for the man with hundreds of animals. The percentage of labor saved is the same.

The Louden Line of Sanitary Steel Equipment Includes:

Litter Carriers
Feed Carriers
Milk Can Carriers
Harness Carriers
Hay Carriers
Feed Trucks
Cow Stalls
Horse Stalls
Mangers
Manger Divisions
Feed Racks
Hay Loft Equipment
Cow Pens
Calf Pens
Bull Pens
Hog Pens
Sheep Pens
Bird Proof Barn Door Hangers
Water Basins
Power Hoists, and Other Barn Specialties

Interior view of the new round barn of the Hershey Company, of Hershey, Pa., manufacturers of the famous Hershey Milk Chocolates. This barn is fitted throughout with Louden Equipment.

The Wisconsin Farmer

THURSDAY, JANUARY 20, 1916.

FAMILY CIRCLE TALKS
BY THE PUBLISHER

PREPAREDNESS IS DOOMED.

IT IS VERY evident to me that the "powers that be" at Washington have been learning the temper of the people—especially of the farmers—here in the middle West on this question of national preparedness. I notice by one of the large daily newspapers today that the president is planning on making a tour through the middle West in the spring, speaking in the larger cities of the grain belt, for the express purpose of counteracting the sentiment against preparedness. The newspaper adds that the president has discovered, to his amazement, that the opposition is much stronger here in the grain belt than any place else, and he realizes that with this portion of the country almost a unit against the plan it cannot possibly succeed. This newspaper story coincides with another one which states that the chairman of the house military committee has advised the president that the preparedness plan is losing strength every day and stands but little chance of passing congress.

Why is it, my friends, that conditions are found to be thus? Solely because the farmers of this great, fertile section of the country, which no one better than the president knows to be the incubator of patriotism and of sound economic ideas, have been thinking over the matter and cannot find anything in the present crisis sufficiently grave to cause us as a nation to abandon the path along which we have trod to such unparalleled prosperity and to force us into the rocky road which leads to compulsory military service, imperialism and general militarism. I do not believe there has been any issue in the last twenty years, unless it was that of one-sided Canadian reciprocity, upon which the farmers of the grain belt, and I believe of the entire United States, have agreed with so little dissension. We are a peaceful, law-abiding nation, respected by every other organized government in the world; we are the ones to whom the warring nations are looking not only for a continuation of their foodstuffs, but as an asylum for their war-sick men and women, once this barbaric struggle is at an end; likewise as the one place in all the wide world where the torch of liberty is expected to be kept burning brightly, unquenched by the poisonous fumes and gases which belch from the mouths of millions of guns and cannons over in Europe. Shall we turn our backs upon our responsibilities, be false to all these trusts, when the only call for us to abandon our peaceful paths and vocations comes, I believe, from those who have a selfish, monetary interest in the matter or who are temporarily carried away by a wave of false patriotism?

My friends, I feel very deeply on this subject; that is one reason why I keep it before you so much of the time, here in my page of heart-to-heart talks. I believe you agree with me, for the letters which come to my desk, literally by the scores and hundreds every week, are almost all written in the same vein: Approval of what I am doing. Here, for instance, is one of the last, written by Mr. W. F. Porter, of La Plata, Missouri, after reading my article answering the soldier, on the Texas border, who wrote to inquire why the farmer should have any more to say on a nation's preparing for war than a soldier should be expected to judge Poland China hogs or Jersey cattle. Mr. Porter, a good farmer and a good patriot, writes as follows:

> In your last week's paper you have answered the soldier fairly and without harshness. His letter evidently showed the prevailing contempt for those engaged in peaceful pursuits by those of his profession. The soldier is scarcely to blame for adopting such a view, for writers of fiction, of history and speakers from the forum have for ages magnified the importance of the soldier. And in saying this I do not mean to detract one iota from the credit due to the defenders of our country, nor would I have my friend, the professional soldier, forget that in every crisis of our country the farm and shop have not only cheerfully contributed to the needs of the armies in the field, but have as promptly furnished the men for the firing line, and history proves that there they were the bulwark of our nation's defense. If ever the time comes when the soldiery of our nation succeeds in divorcing itself from the producers of material things, as seems to be the incessant cry of a few war heroes, then may God pity this country, for its decay will be sudden and swift. Every homemaker is a home protector, and while in his patriotism home and country are so blended that his protection extends as freely, yes, I may say as fiercely, for the one as the other, a country so protected is safe against attack from without or within. But, let the army become a burden upon the people because of its size and expenditures and the people will say, "Let *them* fight; that is what we have been keeping them up for," and the feeling of personal interest and personal responsibility will lessen and in time cease. If there were reasonable possibilities of need for extra preparedness there would be no objections raised by the farmer. But we are not caring to rush in and overwhelm the war-depleted powers of Europe, and they will be in no condition, nor have any inclination to make attack upon our peace. Then why this extravagant, blustering rush to arms?

Shall we not continue to harbor high ideals, to strive after what we believe to be right and best, to hold the ship of state true to the course which reaches toward the haven of peace, plenty and prosperity and turn our backs on those who would lure us into blood-filled trenches and over blood-stained battlefields? With the rank and file of American farmers united, we can crush the military spirit which seeks to become rampant and can keep our nation an agricultural and industrial one, given over to the useful pursuits of peace, rather than to the destructive ones of awful, useless war.

CONFIDENCE IN THE BANKER

I SPENT a very enjoyable half hour last night reading an address delivered before the Farmers' Institute of Mills county, Iowa, by Fred Durbin, a man of lifetime experience in farming and sixteen years' experience in the banking business. Mr. Durbin spoke on the relations of the farmer and banker, a subject which is always intensely interesting to me. I congratulate him on his very excellent address.

One point Mr. Durbin brought out was that no man has greater confidence in the country banker than has the farmer. He illustrated this by telling of a farmer, one of the bank's customers, who came in during the panic of 1907, when clearing house certificates were being issued in lieu of money quite generally throughout the country, and said he would like to use $5 of the sum he had on deposit, but if the bank did not want to let him have it he would get along without it somehow. Mr. Durbin adds this pertinent comment:

> If all depositors were as fair as this one, banking would be a bed of roses. In contrast to this incident, a man sat in our bank one day during that panic and said that if he had any funds in a bank and that bank refused to pay them out, he would close the doors of that bank. This man should have been told to close the door from the outside, for I had personal knowledge that he had almost closed the doors of a bank, for, by his own plunging, he had lost them many thousands of dollars. I know we owe it to the farmers of our community that the banks of Malvern were not forced to limit the payments of checks during that panic. They realized the fact that their own institutions were at stake and rallied to the support of the banks even though they were not stockholders in the institutions.

In another portion of his address Mr. Durbin raises the interesting point, extremely well taken, I think, that when you are a depositor in any bank you are a partner in that institution just as much as though you were a stockholder or a director. It is your money that is keeping the bank solvent, that is enabling the banker to carry on his business. You have an interest in that bank, therefore, just as much as if you owned a block of stock or were an official thereof.

I have always contended that it was the grain belt which saved the nation from serious financial panic back in 1907. The East was extremely hard hit; we confronted one of the most serious crises in our history. But the sound, substantial, reliable middle West refused to lose its head, refused to let the panicky feeling rob it of its good sense and by rushing money from the middle West—where depositors had faith in their banks and bankers—back to the East, where the danger was most imminent, the panic was averted and the nation rallied. It was the confidence which the farmers of the grain belt felt in their home-town banker that saved the day and the nation.

Do you think for a minute that if the farmer, who comprises more than one-half the population of the middle West, did not have absolute confidence in his banker the number of banks in seven states here in the grain belt (Wisconsin, Illinois, Iowa, Missouri, Kansas, Nebraska and North Dakota) would have increased 232 in the last year, or that the deposits in nine of the ten grain-belt states would have increased over $220,000,000 in the state and savings banks in the same time? Banks are not being established if there is no business in sight; depositors are not putting their money away in annually increasing amount unless they have absolute confidence in the men to whom they entrust their earnings. Mr. Durbin is right, indeed, when he concludes his address with these words:

> There are nearly 150,000 bankers in the United States and several million farmers. Every man is a power in his community. Can you imagine the tremendous influence these men would have upon our agricultural and commercial life if they became better acquainted with each other and helped each other to become more efficient?
>
> The banking institutions of this country are open to you.
>
> Get acquainted with your banker, enjoy his hospitality, use him when you need him and help him when you can and by so doing your farm lands will grow richer, your sons and daughters will be provided for and your banking institutions will grow stronger and the union between farmers and bankers will be complete.

THE VALUE OF SAVINGS.

I WANT to say just a word to some of my young readers on the subject of thrift. I sometimes fear the present generation does not sufficiently realize the value of the pennies.

Of course, the farm boy working at home, who does not receive a regular wage, does not have the chance to start and maintain a bank account as does the city boy. Yet I have the honor to know any number of farmers, now well-to-do, who started on their own hook with nothing more than a pig or a calf their fathers had given them, or who were allowed the product of some one acre, and by hoarding their small earnings soon found themselves in a position where the home-town banker was knowing them by sight, through seeing them come in every now and then with their little deposit, adding to their savings account. One of my editors, who recently spent a day on the farm of Frank Gotch, the world's champion heavyweight wrestler, told me that Gotch's fortune today, conservatively estimated at a quarter of a million dollars, is due as much to his thrift as to his big earnings on the wrestling mat. If Gotch won $10,000 or $15,000 one day wrestling and had a chance to make $50 more the next day by exhibiting in a theater he invariably took the smaller job and the smaller sum, no matter how big had been the earnings the day before. Don't despise the little amounts, my young friends, just because you made a bigger amount yesterday, or think you have a larger stake coming in soon.

I was quite interested, in reading one of the current magazines, to see how small savings ultimately develop into large ones. This magazine goes on to say that if a young man deposited $5 every week he would see the day, in twenty-five years, when he could retire from active work and have an income as large as that from which he saved the $5 weekly in the beginning. It is quite interesting to see how it figures out. At the end of the first six months of the weekly deposits of $5, the young saver would have $130. At the end of the first year he would have $262.60, including the 4 per cent interest allowed by the bank. The magazine then has him invest his savings in a real estate mortgage, drawing 6 per cent, with the following result:

> Having made the investment, at the end of the fourth year of his saving, the young man would look forward to saving, the first six months of the fifth year, the following: First, of course, his regular weekly deposit of $5, or $130; second, the six months' interest at 4 per cent on $123.89 (the amount left after he had drawn out $1,000), which would amount to $2.46; third, the interest at 6 per cent, earned by his real estate mortgage, or $30. This would make a total of $162.46, added to the $123.89 left in the bank after drawing out the $1,000, and the total would amount to $286.35. By the end of the fifth year, this sum would have increased to $452.08—almost half enough to buy another $1,000 mortgage with.
>
> He would be able to buy his second $1,000 mortgage at the end of the seventh year. It would not be very long after this before he would arrive at the point where he could buy the $1,000 mortgages with greater frequency. If he continued the plan for twenty-five years he would own fourteen mortgages and have a bank account amounting to $761.33. By using the accumulated interest on these two, together with the regular $5 weekly saving, he would at this time be able to buy a $1,000 mortgage every six months.
>
> By this time he would have reached his forty-seventh year, provided he started saving when he was twenty-two years old. Suppose he continued until he was fifty years of age. At this time he would own $17,000 in 6 per cent mortgages, and have a bank account amounting to $799.22. He could easily retire then. Figure the income from his capital. Four per cent a year on $799.22 would amount to $31.17. Six per cent a year on $17,000 is $1,020. Add them, and you find that he receives an annual income of $1,051.17 or $20.21 a week.

I am not going to say that many farm boys can do this, keeping it up uninterruptedly. I do maintain, however, that this shows in striking manner the possibilities of small savings. My young friends, save your pennies and nickels, invest them carefully and the day will come when your money will work while you rest at ease.

Wisconsin Live Stock Organizations Should Not Die.

THE latest figures furnished The Wisconsin Farmer by the Wisconsin Live Stock Breeders' Association shows that 122 community live stock breeders' associations have been organized in this state. This puts Wisconsin in the lead in this state, and we wish to urge the members of those organizations which are dying out to wake up; put them back on their feet and get into the game of improving farming and stock conditions in their communities. No organization can live without enthusiasm; without the interest of its members and where one of these community organizations is dying from lack of interest someone should assume the leadership and apply the remedy immediately.

Mention is made of this matter at this time because we learn from the secretaries of some of the community organizations that no winter meetings are being held, as some of the members have "dropped out," others "moved away," others "disinterested" and "will not attend," etc. Several secretaries have written The Wisconsin Farmer that their organizations are in a state of coma—just sleeping peacefully when they should be actively engaged in interesting every farmer in their community in better stock, in better farming methods and in other things which will tend to increase the farmer's profits and in turn the profits of the community.

Every movement must have a leader, and without a leader any movement will die. So every organization, whether township, county or state, must have a leader, and if you see the interest in an already organized association dying out it should be your duty to assume the leadership and put your shoulder to the wheel and insist on the co-operation of others. There has not been a community association formed in Wisconsin that should not continue. If there was ever any reason for the organization there is reason to keep it alive. In Wisconsin there are scores of these organizations which are not only doing a great work for the farming business of the state but are making better profits for themselves by bringing their communities to the front. Waukesha county has won a national reputation as a dairy center because of its county dairy organizations. Waukesha county had good dairy stock for sale and advertised the fact to the world, and as the farmers found the market growing they increased and improved their herds and asked and received better prices for their stock. Sheboygan county, Jefferson county and many others have done and are doing the same thing, and there are scores of counties with fine herds and fine farms which are today unheralded and in which the breeders are taking lower prices than they would have to take were they better known. The advertising feature is only one of the many functions of the community organization, and we should not like to see a single one of the 122 which have been organized go out of business. If your organization is sleeping take upon yourself the duties of leadership, apply the enthusiasm to make it a success. Waiting for the other fellow to do it never results in getting anything done. There is also room for many more of these organizations; in fact the need is very urgent in many communities, and there lies the opportunity for some wide-awake booster to do his community a favor by putting the ball into motion.

Where One Cow Is Worth Seventy-three Cows.

IF THERE remains a dairy farmer in Wisconsin who does not consider it worth while to test his cows we believe the report of the official tester of the River Falls and Roberts Cow-Testing Association for the year ending last February will prove an eye opener to him. This report shows that the owner of the poorest cow in the association would have to milk seventy-three cows of her stripe in order to equal the profit of the one cow which was first in the association. The report also brought out the fact that in the association there was a cow in one herd which produced 317 pounds less milk but yielded 210 pounds more butter fat, which at 31 cents a pound, leaves a difference of $65 in favor of the cow producing the smaller yield of milk. So it is seen that the small milk producers are not always the lowest fat producers, and the only way by which the difference can be determined is with the scales and the test. Certainly no better illustrations can be given of the value of the test of why the unprofitable cow should be consigned to the shambles.

The poorest cow in the association returned to her owner a profit of $1.64 above feed. For a year's shelter, care and feed she contributed just $1.64 from ninety-seven pounds of butter fat. On the other hand the best cow produced 570 pounds of butter fat and gave her owner a profit above feed of $116.65. The poorest cow produced her butter fat at a cost of 30 cents per pound; the best cow at a cost of 10 cents per pound. Undoubtedly the owner of this poorest cow will dispose of her immediately unless he is in dairying for the fun of it, as one cow like the best in the association would return him as much profit as seventy-three cows with the same productive ability of this poorest cow. We are pleased to note that all of his cows were not of the poor character and the report shows that the poorest herd averaged 177 pounds, which is a pound or two better than the average for the state.

The figures show that it cost more to feed the good producers than the poor producers, which bears out the oft-repeated statement that the good dairymen are good feeders. However, by spending $3.70 more for feed the best cow produced $40.09 more profit, which certainly warrants the additional feed expense. The length of time a cow is milked also has something to do with her profit and the best cows in this association for the year had a lactation period of 10½ months against an average of nine months for the poorest cows. The best results also came from the cows about six and seven years of age.

The fact that after a year of testing it was shown that some of the smaller milk producers returned more profit on butter fat than those cows with the heavy flow proves conclusively the need of the test, even if the test had no other recommendation.

Wisconsin Banks Show Gain in Business.

BANK statements are always taken as a reflector of the financial conditions of a community, and the annual report of the Wisconsin commissioner, Mr. A. E. Kuolt, certainly bespeaks the prosperity of Wisconsin. This state enters the year 1916 in the very best condition, financially, following a year of big crop yields and satisfactory business conditions which have fully adjusted themselves following the short depression during the outbreak of the war in 1914. Mr. Kuolt has just filed his report with the governor.

During the year deposits in the state banks, those under state supervision, increased $14,897,317 as compared with a year ago while loans and discounts only increased $6,270,218. The average reserve held in the banks has been raised from 19 to 21 per cent and the aggregate capital invested has increased to $22,898,250, a gain during the twelve months of $1,078,300. Their total resources are $253,941,928, which shows a gain in resources for the year of $15,380,195. During the year forty-three new banks were chartered, bringing the total up to 688 state banks, four mutual savings banks and fifteen trust companies.

Certainly with increased deposits and combined resources of $253,941,000 there is no need to look back upon 1915 with disfavor. It must be borne in mind that these figures do not show the gains which must have been made by the national banks and certainly Wisconsin's prosperity cannot be questioned with such a showing. Mr. Kuolt reported that the heavy demands upon the resources of the banks during the previous year of financial disturbance have been entirely adjusted and a return to normal conditions is shown by the increase in bills payable and rediscounts. The banks are also in a position to supply their customers with sufficient funds to take care of reasonable demands, and the increase in the reserves indicates an ability to take care of the farmers with loans when the time arrives.

Warn Wisconsin Orchardists Against Red Cedar.

A WARNING has been sent out to orchardists in southern and western Wisconsin that they must get rid of the red cedar. The charge is made that the red cedar is responsible for a considerable amount of apple rust in the sections of the state where it grows. This lowly member of the evergreen family is frequently found on knolls and bluffs of the southern and western portions of this state. The red cedar harbors and feeds apple rust, which is a fungous disease attacking the apple leaves and in severe cases causing them to fall in mid-winter. This weakens the tree. All varieties of apples are susceptible to apple rust, but the popular Wealthy seems to have suffered most. Doubtless this is because the Wealthy, under proper conditions, does so well in southern Wisconsin that it is more noticeable when it suffers from rust. Apple rust causes the gradual death of the tree.

L. R. Jones and R. F. Vaughan, of the agricultural experiment station at Madison, have been making a careful study of apple rust and have come to the conclusion that orchards may be kept free from rust by observing the following conditions:

1. Choosing a site where no red cedars exist.
2. Cutting down and burning red cedars wherever they are found.
3. Planting varieties of apples which have strong resistance to rust.

There are more or less red cedars throughout the state in sections where apples and other fruits should grow best. Notable exceptions are Door and Bayfield counties, which are outside of the red cedar district. Both Dr. Jones and Mr. Vaughan say that the control of apple rust is very difficult, for the reason that rust attacks the apples in spring and summer and lives over winter upon the cedars. Unfortunately, spraying has not given satisfactory results in controlling this particular disease. Spraying is regarded as an unsatisfactory and impractical remedy where the red cedars are allowed to remain. Varieties which are susceptible to rust are as follows: Wealthy, Dudley, Jonathan, Peerless Sweet, Plum Cider, Sweet Wine, Whitney and Yellow Bellflower. There are a number of stronger varieties more strongly resistant to rust, and these include the following: Fameuse, McMahon, Duchess of Oldenburg, Red Astrakahn, McIntosh and Northwestern Greening.

Our New Serial Starts.

WE BEGIN the serial publication this week of "Hepsey Burke," a sister to David Harum, written by Frank N. Wescott, the brother of the man who wrote "David Harum." We are confident that readers of The Wisconsin Farmer will find "Hepsey Burke" by far the most interesting of the serials which have been run in this paper within the last two years. Hepsey Burke, with her homespun philosophy, her kindly digs at folks and things and her unfailing good humor is sure to be popular with our readers. If you liked "David Harum" you will love "Hepsey Burke.'

The first installment of this splendid new story will be found on page 16. The principal characters are introduced and the reader gets a good idea of the homely settings of the story. A chapter will be published each week until the entire book has been given to our readers. Do not fail to read this first installment. After that you will need no urging to continue until the last of this sweet, philosophical and humorous rural story has been read by you.

For Cleaner Milk and Better Milk Products.

AS OUR cheesemakers, buttermakers and factory owners understand the new state license laws more thoroughly we notice less objection from those affected. The new law is now in force and the dairy and food commission is issuing as rapidly as possible the necessary licenses, The Wisconsin Farmer is pleased to note the change in feeling towards this law, which certainly will be to the advantage of the dairy industry of the state. The new law injures only one fellow—the fellow who has an unworthy establishment. The clean, sanitary factory or operator has nothing to fear from the operation of the new law. Instead he and his factory are protected against the factory and operator who is turning out an unworthy product. In the past, we regret to say, some operators have preferred to make an unworthy product and pay a small fine occasionally. Now such an operator and his factory can be put out of business by the refusal of the dairy and food commission to issue the required license.

Not long ago we overheard several cheesemakers remark that Wisconsin should pass a law compelling every farmer to produce nothing but clean, sanitary milk. Right here lies the opportunity of the cheesemaker and the buttermaker who wishes to produce a high-grade product, for it is within his power to work directly with his patrons; show them that good cheese and good butter can only be made from good milk and cream and that if the farmer is to receive more pay for his milk and cream he must co-operate to this extent with the factory men. The license law goes a long way towards improving conditions, and every cheese and buttermaker should make it his duty to inspect regularly all cow barns and herds from which comes his milk supply; to insist that all cans and receptacles are promptly and properly cleansed and scalded with boiling water, and reasonable precautions taken to insure the delivery of a clean milk supply. This personal co-operation has done wonders in many sections of our state toward providing good, clean, sanitary cow homes on our farms, and we are sure every farmer is willing to do all within his power to produce a good milk supply.

Our cheesemakers and buttermakers should get their patrons to study the question of proper ventilation and light; proper barns in which to house milk cows, and how to feed them properly so as

to get the best results from the feed that is fed. Last but not least let them undersand that dirt cannot be strained from milk and that they must keep milk clean, which means that it must come from clean cows, kept in a clean barn, and handled by clean people. The prize American cheese at the recent Milwaukee convention, so the winning Richland county cheesemaker told the delegates, was made from milk that came to his factory in perfect condition. It was not only clean, wholesome milk but it had been properly cooled and this was largely accounted for by the fact that three-fourths of his patrons had springs in which to cool their milk. Of course, much depends upon the experience and ability of the cheese and buttermaker after he secures his milk supply, but the fact must not be lost sight of that no operator can make good, wholesome cheese and butter without a good raw product with which to work. And this can be produced only in clean, well-ventilated barns, from herds that are well cared for and by farmers who take the necessary precautions after the milk has been drawn from the cow. The license law, with the licensed operators working with their patrons to improve the milk supply, can do much towards raising the standard of this already great and important industry in Wisconsin.

Community Organizations in Wisconsin.

THE first rural social organization in Wisconsin was started in 1890, according to information furnished by C. J. Galpin, of Madison. Mr. Galpin is making an effort to gather statistics regarding such organizations in the state. This pioneer society was known as the La Crosse County Agricultural and Horticultural Association. The purpose of the organization was to combine business with pleasure. Another of the successful clubs of this kind is the Skillet Creek Farmers' Club, of Sauk county, which was organized in 1905 and which has for several years maintained a position of special prominence among community organizations, having about thirty-five, all told, and an exceptionally well-directed country-life association. This Sauk County County-Life Association has an annual picnic in which all of the neighborhood societies join, and this annual gathering is one of the best of its kind in the whole country. According to Mr. Galpin, the counties of the state which lead in social organization are Sauk, Manitowoc, Walworth, Washburn, Waupaca, Douglas and Polk. The purpose of these organizations is to make the community a better place in which to live. It is the ambition of the leaders in the Wisconsin country-life conferences to eventually organize a community society in every township in the state. Whether these societies are successes or failures, however, depends more on the local people than the leaders at Madison. It is all right for Professor Galpin and his associates to make suggestions, but no community society can be a success without one or more leaders in the neighborhood. Some farmer, or teacher, or minister sacrifices some of his time for the benefit of the society. It is not often there are more than one or two men in a township who have the inclination or ability to direct such work. If any farmer, or teacher or minister, or good housewife feels a "call" along this line it is well to confer with Professor Galpin and secure the details of organization which have been worked out. We need more of these community societies, but the demand must come from the farmers themselves.

Wisconsin Farmers Show Interest in Poultry.

ALTHOUGH the state poultry shows, as a rule, are not maintaining their previous records this winter for number of entries, the writer has noticed an increased interest among the farmers of Wisconsin in better poultry, as the farmers are attending better than ever before the various shows. This indicates that the farmer who is raising poultry is beginning to see the possibilities of producing good stock and that an old hen without anything back of her costs just as much to keep as a hen of blooded strain. In the past it seems that the greatest fanciers and lovers of fine poultry lived in the cities or on acreage nearby, but at the shows this winter many farmers are showing, and are taking away their share of the prize money.

We do not wish to convey the impression that a farm woman cannot make money out of her chickens if they are not of blooded stock. But we do know that it costs no more, once a flock is established, to raise good chickens than poor chickens. The eggs can always be sold at market prices, but there is the additional advantage of getting a fancy price for settings, of breeding a cockerel or a pullet which will prove a prize winner and thereby be worth several times the market value for the frying pan. Chicks, if they are to be a profitable investment anywhere, must have care and attention the same as any other stock on the farm. This probably accounts, no doubt, for much of the success of the city fancier who doesn't have any cows to milk, milk to separate, milk houses to keep clean, etc. With many of them his chickens are his recreation, and we can reasonably expect these fanciers to predominate at the shows, for they are willing to pay the high prices for young birds when the farmer would not. This does not keep the farmer out of the blooded field though, for there is the same market for him for settings and young stock as there is for the city fancier, and if he has the goods he can command just as good prices.

It is not necessary that a farmer become a show ring fancier, and we doubt if many of them have the time from their other numerous farm duties to devote to showing poultry, but while he is raising chickens is it not just as easy to rear those of a good strain, those which are good egg producers, good frys or broilers and for which there is a good market for breeding purposes? Too many of our farmers just "keep poultry" when they could with a little more care and attention be making this sideline of the farm pay them well. They are better situated than the city fancier who must buy all his feed, but too many of them keep no records of costs, etc., and have no idea whether their chickens are costing them money or making them a profit. We are pleased to note more interest by the farmers in the shows and are sure they will derive much benefit from attending them.

Farm Prosperity in South Dakota.

THE fifteenth annual review of the progress of the state of South Dakota has just been issued by the department of history. The production of grain for the past season and value of the same is given as follows:

Wheat, 62,520,000 bu.	$ 53,767,200
Corn, 96,300,000 bu.	52,928,000
Oats, 68,124,000 bu.	18,928,000
Barley, 25,856,000 bu.	10,859,520
Flax, 3,800,000 bu.	6,004,000
Potatoes, 7,680,000 bu.	2,611,200
Total	$145,563,400

Other items from the report of the United States Department of Agriculture:

Vegetables and fruits	$ 2,750,000
Hay, 3,330,000 tons	16,650,000
Dairy products	10,000,000
Poultry products	9,750,000
Live stock	51,250,000
Minerals	8,200,000
Total	$ 98,600,000
Grand total for 1915	$244,163,400
Grand total for 1914	212,423,000
Increase	31,740,000

This is a good showing for our western neighbor. South Dakota has had an occasional bad year, of which 1912 was probably the most conspicuous. But the state is settled up with good farmers. It is no longer a one-crop state. The increase in live stock has put farming on a much more substantial basis. South Dakota has still a great deal of room to develop.

Overproduction of Live Stock Impossible.

IT IS OFTEN necessary to bolster up the courage of stockmen. Important as is the live stock industry in its relation to production generally, it is to be deplored that the ranks of stockmen are subject to such never-ending change. This is due, of course, to a variety of factors, chief among which is the violent fluctuation of values of finished animals. No way has ever been discovered to regulate the number of animals that are marketed at any particular season of the year, and herein lies the secret of changing values, not that the law of supply and demand is wholly operative but, rather, that the changing supply furnishes those who control the markets with the opportunity and the excuse for filling coolers with a low-priced product. Arthur G. Leonard, president of the Union Stockyards, has recently given in the Drovers Journal his views regarding the live stock outlook for the year 1916. According to Mr. Leonard there will almost certainly be a general scarcity of fat cattle and sheep of all kinds during the whole of 1916. Disease and the fear of disease, together with poor corn, have driven many out of the feeding business, and the prospect is not good for feed lots to be filled before another crop is available, at least in all the northern corn-belt states.

A moderate run of range cattle and sheep may be expected when the next season arrives, but with a favorable prospect for the next corn crop, many of them will be needed for feed lot use, and the beef and mutton supply from every source bids fair to be light for most of the coming year. A word of caution against marketing too many half-fat yearling steers may be needed before the year is over, choice ones always being in demand, but not the inferior kind, so that they should be well finished before being sent to market.

Because of heavy shipments on account of 1915 corn crop conditions and the present relatively low prices for hogs, only a moderate crop of pigs may be expected during the coming spring months. It is probable that all the pork raised during the next year will be needed at satisfactory prices.

Those who are fortunate enough to have on hand good breeding stock of any kind, and who will purchase suitable pure-bred sires of individual merit at the present relatively low prices for such stock, and then keep them in good, thrifty condition and raise all the progeny from them which their farms can carry, will have no reason to regret having followed such a course, which is according to the advice of the best minds in the business.

If in addition to the above they will build silos and raise crops of grain to fill them, so as to provide abundance of economical feed, they will have still more reason to be satisfied with the final returns from such gradual improvement.

American finances are now in good shape and labor is well employed. Our own population is constantly growing, with no corresponding increase of live stock to furnish it with an adequate supply of meats, milk, leather, wool and other animal products and by-products, while, with the shortage of live stock in other countries to be recovered from there, and all Europe to feed in the meantime, no material foreign competition is possible for at least another decade to come.

What this country most needs today is a larger number of farmers who will adopt modern, up-to-date methods in the production of more and better crops, with more and better improvements upon the land which they now own, rather than seek to own more land without a corresponding increase in the capacity to develop and use it, or than to remove to other regions with the conditions of which they are not so well acquainted, and where they will be farther from market, with all the disadvantages of a new country and strange climate to contend with.

There is no better assurance of permanent comfort and success than good breeding and growing stock on the farm that raises abundance of feed, with a silo to help preserve it all for use, and a manure spreader to prevent waste of fertilizing elements, thus turning everything into money and gradually raising the producing capacity of the farm.

The conclusion, from a careful survey of the whole situation, is that overproduction of live stock is possible. On the other hand, present conditions and future indications all point to a continuous heavy demand and good prices for all the farm animals which this country can produce for many years to come.

Feeding Cattle a Science.

CATTLE feeding is a science, and anyone who can do the work successfully is more or less of a scientist. Feeding is almost if not quite as precise as mathematics, as certain feeds produce certain results, and it takes a well-posted man to know how to feed, this, that and all together to get the best results. This is where the science comes in. Then, there are combative forces with which to contend, such as storms, mud, severe cold, disease, hard feeding animals, and fluctuations in the markets of feed and the animals themselves when ready to market. The one who can do these things and still make money feeding cattle is a scientist. Each part of the process is necessary and the results are certain, under normal conditions, almost as sure as if you cut six inches off from a stick it will be just six inches shorter, no more, no less.

The work should be regular and steady. In the beginning make haste slowly. Do not overfeed. Too much corn will throw them off feed, and set them back a week or two and sometimes it is with much difficulty that they ever recover. Feed lightly at first on corn and add a little more gradually each day until they are on full feed, giving them when on full feed all they will clean up two or three times a day. Feed no moldy feeds of any kind to fattening cattle.

Watch your cattle closely and see the effects of your methods of feeding. Too much grain will cause scours, and if continued your steers will lose instead of gaining in flesh. This loses you money. Feed so that they will be as ready for the next feed as they were for the last. It is "good methods" to have all cleaned up each feed and satisfied cattle at the end of each feed.

Do not feed heavily at one time and lightly the next, as you will lose money if you try that. The feeding business is so doubtful that no one can afford to do anything that he knows is not the best for the interest of the cattle.

If you are compelled to make any changes in feed do it slowly and gradually. The fewer the changes made the better. Look well to the condition of your cattle. It is the indicator that tells the effects of your methods of feeding. Look well after your supply of water. Keep it clean, fresh and an abundance always on hand, for it is the cheapest and greatest element in beef production. It should never be scarce except under foot or in the sleeping quarters. There it is detrimental and actually costs you cash to tolerate its presence.

Get your cattle used to salt, and when used to it keep it where they can always get it. It causes them to eat and drink more. To fatten fast they must drink much and eat much. In cold weather the cattle usually drink too little. The tank heater will help this fault.

Keep enough shoats and hogs running after your cattle to take care of all the waste. This will fatten your hogs, and with the manure for your land you will be paid well for your efforts, if you feed right and use the proper feeds. Suffice it to say here that the ration should be well balanced if the best results are to be obtained.

Careful feeders linger, at least a while, around the feed lot each day looking for ailments of the cattle or hogs. A little such time spent with eyes wide open will enable you to see any ailments and give you nearly an even start with it. You can also see the good or bad effects of your feeding and likely enable you to study out the cause why one does well and another poorly. A little time spent in lingering is by no means wasted and pays big dividends. It does not pay to feed quickly and go at another chore without looking well at the cattle and hogs. One is almost as necessary as another.

You may look for months and find nothing wrong, then all at once something will happen. You see it soon and by prompt action you may save a $75 to $100 animal that you would have lost had you not looked constantly for ailments.

Adding Interest to School Work

Rural School Contests in Oconto County, Wisconsin, Have Been a Great Source of Profit and Enjoyment.

MADE THE CLOTHES THEY ARE WEARING.
Two Oconto county, Wis., girls who made their own dresses and won prizes in the county contest.

FEW county superintendents of schools in the country have been able to interest school patrons and scholars to such an extent in contest work as has Ellen B. McDonald, county superintendent of Oconto county, Wisconsin. Any person who might imagine that school work is any ways backward in this Upper Wisconsin county is certainly sadly mistaken. Under the direction of Miss McDonald and members of her teaching staff in the county scores of pupils have become interested in better farming. This woman does not claim to be an expert agriculturist, but she has succeeded in taking extraordinary advantage of the opportunities afforded for branching out in rural school work. There are few counties in the United States where so many bulletins on agriculture and live stock topics are distributed. As a matter of fact, all county superintendents have the same source of information on agricultural topics that the county superintendent of Oconto county has. The federal department of agriculture will assist any county superintendent with literature and suggestions as to the best way to work out county contests for the education of the rural young people. The Wisconsin College of Agriculture has special departments and experts devoted to extension work of this character. Other states, notably Iowa, Minnesota, Nebraska, Kansas and Oklahoma, have taken up this problem. Miss McDonald has availed herself of various experiences and supplied herself with their bulletins. She has advised teachers in the districts throughout her county where information on such subjects can be secured without cost. In this manner she has brought the rural school-teachers of Oconto county into close connection with the most advanced thought of the day on rural education. There are a number of teachers in Oconto county who can readily tell any farmer or his children where they may secure the best bulletins on almost any crop in which they are interested.

Contest work was started in Oconto county several years ago and it has developed to include a large per cent of the rural districts. Although Oconto county is considered some distance north, boys who have entered the school contests have raised 125 and more bushels of good corn to the acre. Girls who have engaged in the sewing contests have learned to make all their own clothes. As a result of these contests there have been larger yields of beets, peas, beans and potatoes on a number of farms in Oconto county. There has been more interest in poultry and in gardens.

Asked concerning the effect of these contests on the pupils and their parents, Miss McDonald advises that she did not have the smoothest kind of sledding at the start. But the effect of the contests was so soon apparent and so satisfactory that now it is an exception for any of the districts to show a lack of interest. The first good effect of this contest work was to provide something interesting for the pupils as a sort of relaxation from steady work on their textbooks. The contest feature of the agricultural work carried on in Oconto county put life and competition into school duties. While for the most part, at first, no prizes were offered, except ribbons. These seemed to be as attractive as larger cash prizes. The contest provided an end toward which the pupils worked with increasing interest until the final decision of the judges. The interest from the standpoint of the parents was a natural outcome of the interest which the pupils took in the contests. For a time the farmers did not pay any considerable attention to the suggestions which came to them from their children. But when the boys raised 125 bushels of corn to the acre and the farmer had been in the habit of getting twenty-five or thirty bushels, the parent began to show some interest in the contest work. There was at first a disposition on the part of the mothers to feel that they were best equipped to teach their daughters cooking and sewing and canning of fruits and vegetables. But when it was discovered that the girls were getting a new interest in such work by their experience at the schoolhouse the mothers welcomed this new interest and were enthusiastic in helping it along. It did not take long for the farmers and their wives to become more interested in the school-teacher who was carrying on this new kind of work. One feature of the contest

ELLEN B. M'DONALD.
County superintendent of Oconto, Wis.

work is the exhibit. This, of course, comes at the end of the growing season. Before it becomes time for the exhibit the contest work has been pretty well advertised throughout the district. Not only are the pupils anxious to learn who will win the prizes but the parents also. When two or three years of this special work has been carried on the pupils, teachers and parents seem to fall very naturally into the spirit of the whole movement.

But the contest work in Oconto county has not only interested those in the immediate districts affected. The farmer goes to town and is beaming with enthusiasm because his boy has raised the best corn or the best potatoes. He drops into the local bank, or newspaper office, or general store and tells all about it. With contests going on in a number of districts it becomes only a question of a short time until there are a good many boosters for the work. Superintendent McDonald was quite surprised one day when a wealthy man of her county

(Concluded on page 20.)

More Farmers at Auto Show.

Big Event at Milwaukee Is Featured by Larger Attendance of Rural Automobile Drivers--The Auto Show a Big Success.

FARMERS are the largest buyers of automobiles in Wisconsin, and it is fitting that they should display each year more interest in the automobile shows. Being such general users of the motor driven vehicles they should be as much interested as the merchant and the city man in the new models and the increased attendance of farmers at the show this year in Milwaukee indicates an increased rural interest in the coming season and a widened market for the automobile.

The show which closed in Milwaukee last week was better attended by farmers than any previous show. Dealers and manufacturers reported an increased number of inquiries from the tillers of our soil and the breeders of our stock and Mr. Bart Ruddle, show secretary, told an editor of The Wisconsin Farmer who attended the show that he had never seen so large an out-of-town attendance as this year. On the second day of the show the corridor was crowded before the doors were thrown open and it is the farmers and their wives who come early and stay late. As a rule, the farmers do not begin to attend until the third and fourth day, and Mr. Ruddle construed this early attendance this year as an indication of an increased interest by the rural population in the new models and the automobile in general. The farmer has begun to realize that the automobile to him annihilates distance and time, and with the advance of the good road movement it is becoming indispensible on the farm.

The statistics in the office of the secretary of state show a registration of 79,000 automobiles last year, which is almost double the number of cars registered in Wisconsin the previous year when 43,000 licenses were issued. At the present time applications for 1916 licenses are pouring in at the rate of 600 a day, which indicates that at the end of the present year Wisconsin will have more than 100,000 automobiles, and the dealers are preparing to sell at least this number of cars. If the ratio of increase of 1914 is maintained the number of cars licensed this year would far exceed 100,000, but the dealers are discounting somewhat the increase last year and are preparing for a 25 per cent increase in the market this year. The larger portion of this increase will come from the farmers, as they are the largest class of buyers, and with a good season to their record they can be expected to buy heavily this year.

Following the automobile show at the state fair last year, so Mr. Ruddle informed the writer, the Milwaukee Automobile Dealers' Association attempted to ascertain the number of farm-owned automobiles in the state. It was found that 48 per cent of the cars owned in Wisconsin at that time were licensed by men living on rural routes, which means that almost half of the automobiles belonged to farmers. Other figures were also compiled which showed that 73 per cent of the automobiles were owned by rural residents—that is, by farmers and persons living in towns or villages of less than 1,000 population. These totals were arrived at by dividing the state into districts and striking an average by counties and are probably as correct as any that can be secured.

Certainly with 73 per cent of the cars in the hands of the rural population and 48 per cent owned on rural routes it is no surprise to find the farmers attending the automobile shows better than ever before. The farmer has the buying power and he is buying better cars every year. Mr. Ruddle, who is in very close touch with the market, expressed the belief that the type of car being bought now by the farmers of Wisconsin averages as good as the car bought by the average business man.

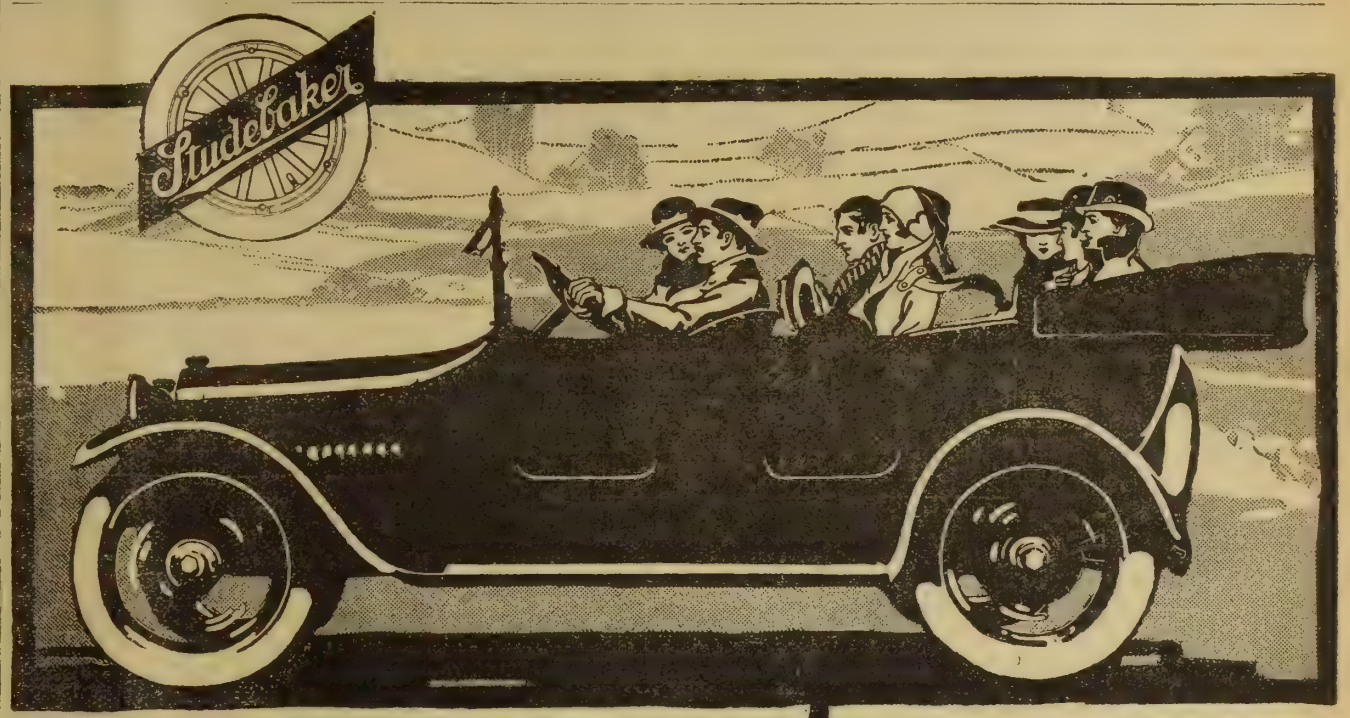
Road improvement, combined with increased prosperity, has done much in Wisconsin to encourage the automobile on the farm, and with more state roads and better county roads being constructed each year the list of farm owners is certain to increase. The farmer has discovered that he cannot only find much pleasure in owning a car but he has found them useful on the farm. Dealers at the Milwaukee show reported many inquiries by farmers for light trucks and roadsters which would be used for the family on a trip to the village and for light hauling during the week.

Much as the success of the show meant to the thousands of prospective car owners and those who contemplate buying new cars this year and to the men who staged the exposition it proved a record breaker from the standpoint of the dealers. On every hand complete satisfaction was expressed by the dealers with the results, and they are convinced that the coming season will be one of heavy sales and good profits. Hundreds of country dealers who are in direct and personal touch with the farmers attended the show and all reported that increased interest of the farmer and with a return to normal financial conditions, combined with good crops, and $15,000,000 more on deposits in the saving and state banks than on January 1st a year ago they contracted heavily, not only for cars but for tires and other accessories.

The retail trade was equally good and the show closed with an attendance of about 41,000. The extremely cold weather of the last few days cut down the attendance to some extent but did not dim the interest, and hundreds of persons picked out their cars for the coming year, there being everything on display from the more modest-priced roadsters and touring cars to the high-priced electrics and limousines. There was more to interest the farmer than at any previous show, and the managers, who had begun to plan the 1917 show and the exhibit at the state fair this fall, almost before the show closed, are planning to make the show even more attractive to the rural buyers next year, realizing that the farmers are one of the largest buyers of automobiles in the state and that they are buying cars that are the equal of those bought by the average business man.

Several agency managers interviewed by the writer, including Overland, Hudson, Reo, Studebaker, Page, Jeffrey, Allen, Jackson, King, Velie, Hupp, Dort, Pullman, Regal and others, expressed the belief that the automobile business will be a record breaker this year. All agreed that trade prospects could not be better and that the show had been a big booster, especially for the new six and eight-cylinder models. The general expression of the agency managers was that they had done more business than they had anticipated. Not only were the sellers of pleasure cars greatly pleased but the truck dealers reported a great number of inquiries and sales and a greater interest by the farmers, who, with good roads, are

(Concluded on page 15.)



Why the NEW Series 17 Studebaker is the GREAT Value of the Year

To any man who knows cars or who has kept in touch with the new cars of the year in any way whatever, there is no necessity for our saying more than "Read the reasons listed at the side".

Buying a car is merely a matter of getting the biggest value, the most satisfactory car for the price you pay. Every man who owns or operates a farm knows from long experience the QUALITY that the name of Studebaker insures. And the unexcelled manufacturing facilities, the GREAT financial resources, the long manufacturing experience and the largely increased volume that the remarkable popularity of the new cars has produced has made possible many refinements and a REDUCTION in price to $845 that makes this new SERIES 17 Studebaker FOUR the GREAT value of the year. See it before you decide on any car. Handsome catalog on request.

Open Express, complete	$1200
Stake Body, complete -	1250
Bus, 16-pass., full equip.	1400

—a remarkable price of

$845

—a 3 7/8-inch bore by 5-inch stroke, FORTY horse power motor;

—ROOM for SEVEN passengers—and comfort for every one of them

—beauty of design and finish;

—and many new refinements including:

Gas tank transferred from the cowl to rear of chassis

Stewart Vacuum Feed System set on intake manifold

DIVIDED front seats that are adjustable fore and aft to the passenger's comfort

MORE room everywhere in the car

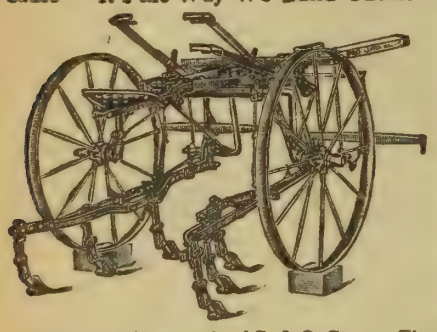
Overlapping windshield, completely storm-proof

Instruments even more conveniently arranged on dash, indirectly lighted.

P&O

WIGGLETAIL CULTIVATOR

A cultivator combining the advantages of pivot seat, pivot tongue, parallel gang movement, and horse lift. The best, because—"It's the Way We Build Them."



Equipped with any style of P. & O. Gangs. The wheels are adjustable from 40 to 54 inch track, so that the Wiggletail can be used in crops other than corn. Can be furnished with Handle Attachment, permitting use as Combined Rider and Walker. High wheels, with flat or concave tires.

Tougue pivoted in socket at front end of frame, and also pivoted on arch. When rear end of tongue is moved sidewise by the shifting of the seat, frame is carried in opposite direction, and with it the arch and gangs. This constitutes the "Wiggletail" feature, and makes this one of the easiest cultivators to ride and operate ever built. An ideal cultivator for use in crooked rows or on hillsides.

Only one lever to operate at ends of the row. It raises both the gangs and maintains balance. Cone pivot gang couplings permit taking up all lost motion due to wear. Beams can be set up or down for different depths. Seat folds over out of way when using cultivator as a walker. The seat bars can be locked, making frame rigid. Adjustable hitch. Direct pull from the gangs. Gangs work under spring pressure, are always parallel and have a wide range of side swing. Operator always in position to see his work, with a clear view ahead. The operator's weight glides on rollers when swinging seat bars in dodging. Telescope axle provides neat and easy means of setting wheels for wide or narrow track. Frame shift squares gangs with each hill, cultivating them all even and at an equal depth. High clearance under arch. Each gang has a depth lever.

Guarantee

BUCKEYE GRAIN DRILLS

Have a Double Run Force Grain Feed—sows any kind of oats, wheat, rye, rice, barley, peas, beans of all kinds and sizes, beets, etc.

The Buckeye Non-corrosive Glass Cone Fertilizer Feed successfully sows in wide range of quantity all brands of standard commercial fertilizers, having an agitator that always keeps the fertilizer moving; a fertilizer hopper lined with galvanized metal.

The Buckeye Frame is made of square tubular steel; will not warp or sag.

The Buckeye Nested Cone Gear Grain Drive. No lost motion. Positive drive. Change of quantity instantly made.

Buckeye Furrow Openers—Any style wanted. Single Disc, open or closed delivery; Double Disc, Hoe or Shoe.

Sizes—Any size from one-horse up.

Buckeye Drills are simple in construction, very light draft, and plant the seed at an even depth.

Send for the Buckeye Catalogue and then go to your local dealer and insist on seeing the Buckeye Drill.

"The Buckeye—
A Wise Buy."

THE AMERICAN SEEDING MACHINE CO.
INCORPORATED
SPRINGFIELD, OHIO.
U.S.A.

In And Around Wisconsin.

Eau Claire Chosen as Place for Holding Next State Potato Show and Convention—Other Items of Interest to Farmers.

The new co-operative packing plant at Wausau, Marathon county, is now operating, the first shipment consisting of two carloads of hogs.

J. R. Wheeler, vice president and cashier of the Farmers & Merchants Bank, at Columbus, has been honored again by appointment to membership on the agricultural commission of the American Bankers' Association. Mr. Wheeler is well known throughout the state in his work for better agriculture.

Thirty-seven new members were added at the annual meeting of the Central Wisconsin Cheese, Butter and Dairymen's Association, which was held at Auburndale, Wood county. This was the first anniversary of the organization of the association and a very successful meeting was held. The association went on record commending the National Dairy Union and the National Buttermakers' Association in their fight on the "oleomargarine evil."

Following adjournment of the Wisconsin cheesemakers' convention at Milwaukee recently, sixty shippers from all parts of the state met and formed the National Cheese Shippers' Traffic Association, with H. G. Davis, of Plymouth, as president; vice president, Jess Willard, Plymouth; secretary, A. A. Jones, Fond du Lac; treasurer, Christ Roth, Brodhead; directors, John Kirkpatrick, Sheboygan; Christ Roth, Brodhead; John Kirkpatrick, Richland Center; F. C. Westphal, Randolph; P. J. Schafer, Marshfield, and C. A. Cebell, Watertown.

The Fond du Lac County Agricultural Society, at its annual meeting recently, honored all of the old officers with re-election. The association has also decided to continue the 50-cent admission fee this year, with children free. It was proposed to return to the 35-cent admission, but the fair officials believe they are putting on a 50-cent show and that the patrons will be willing to pay that amount. The officers for the coming year are: President, C. W. Keys, Empire; vice president, L. G. Kellogg, Ripon; secretary, E. R. Zamzow, Fond du Lac; trustees, Peter Schrooten, Auburn; John McGowan, North Fond du Lac; E. W. Phelps, T. E. Ahern, L. A. William, Fond du Lac; W. L. Calvy, Osceola.

Oneida county, whose potatoes carried off honors at both the state and national shows, is still winning honors and recently W. D. Juday, county representative, received this letter relative to a shipment sent to Ames, Iowa: "The shipment of potatoes came to hand in fine shape, except a few of the Bliss's Triumph, which had split open, due, I presume, to excessive changes in temperature. They were very much admired at our state show and at the close of the meeting I packed them up and brought them on to Ames, where we plan to use them at our short course the last of this month. I think it was a good move in sending them to Iowa, as it will help to put Oneida county on our map. Yours, A. T. Erwin."

Although the past year has been an unsatisfactory one for the tobacco growers of Wisconsin, it is believed a good acreage will be devoted to this crop next year. The brightest ray of hope now held up, says the Tobacco Reporter at Edgerton, is the fact that before another crop can be produced the stock of old leaf suitable for cigar purposes is very likely to be entirely absorbed, leaving an excellent prospect for a strong demand for binder leaf for some time to come. In the nature of things Wisconsin ought to be due for another good crop in 1916. There are still a few thousand cases of the 1913 crop yet in the hands of the packers, but the supply is far short of the needs of the binder trade before the 1916 crop can be placed on the market. The 1914 crop, thought to be largely a filler proposition and taken over at reasonable rates, has proven a big investment for the packers since the unsatisfactory yield the past season.

J. R. Danks, formerly in charge of the Christiansen farm in La Crosse county, has been appointed assistant in animal husbandry extension work at the University of Wisconsin.

The Inter-County Holstein Breeders' Association met recently at Watertown and it was decided to ask the state association to hold its state meeting next year in Watertown as the guests of this organization. S. E. Jones is president of the Inter-County association and those present represented nearly 1,500 of the pure-bred Holsteins of that community. Another meeting was called for January 22d at Watertown, when additional plans will be laid for securing the state Holstein gathering.

Mr. A. D. Campbell, of the Wisconsin Advancement Association, has discovered a farmer in southwestern Wisconsin who makes the statement that quack grass brought him $100 per acre. The quack grass had gotten the start in his field and defied all efforts at extermination. Finally, yielding to advice which a few years ago would have been ridiculed, this farmer seeded the plot to alfalfa and this year took off a crop worth $100. So he insists that the quack grass is responsible for the $100-per-acre crop. Mr. Campbell does not argue the question, but says if there is no other or better way to prove to farmers the value of alfalfa they may find it out by using it as an exterminator of quack grass.

The report of the financial affairs of the La Crosse Co-operative Packing Company at the annual meeting last week indicates that the plant is on a more substantial basis than ever before. The directors ventured the opinion that the plant had passed its crisis successfully, has shown a profit since October 1st, although a losing proposition the first few months. The financial statement shows a profit for $1,800 in December and at the present time the plant is handling on an average of 500 hogs and fifty cattle per week. About $1,500 worth of meat is sold each day. It was announced the company finds a ready market for all of its products and could easily dispose now of an increased output.

Eau Claire has been selected as the place for holding the 1916 convention and show of the Wisconsin Potato Growers' Association. Final action in selection of a convention seat was left to the board of directors at the convention at Marinette last fall. Fournier's Hall at Eau Claire will be used. Chippewa Falls was very seriously considered, but after a visit of the executive committee to that city it was decided there was not a hall large enough to take care of the coming show. J. G. Milward, secretary, expects at least twenty-five counties at the 1916 show, as the holding of the show at Eau Claire will stimulate many western and northwestern counties to enter, while central and eastern counties will also be represented.

In 1911 the records of Green county showed 199 automobiles. There are now assessed 199 automobiles in the city of Monroe alone, while the total of the county is 979. The increase in automobiles in Green county has been phenomenal. Starting with 199 in 1911 the number increased to 277 in 1912, 440 in 1913, 599 in 1914 and 979 in 1915. The largest per cent of increase in this period has been in the past year. This has doubtless been due to the fact that there are now so many good cars to be had at a reasonable price. There has been about the same per cent of increase of horses in the county each year, so that it may not be truthfully said that the automobile is supplanting the horse. Green county farmers go in extensively for dairying. The farmers of this county are uniformly well fixed and amply able to increase their stock of good horses and at the same time buy automobiles.

A new co-operative creamery is to be organized at Antigo at a mass meeting to be held in the court house January 22d.

J. C. Sikhart, of Muscoda, has been appointed assistant chemist in the soils department of the University of Wisconsin for two months.

A good poultry show in which farmers were the chief participants was held late in December at Footville. There were 198 birds exhibited and the attendance was very satisfactory. Rev. Laramore, of Footville, was the judge.

The bankers of the state are planning another excursion in Upper Wisconsin in 1916. Secretary Bartlett, of the state bankers' association, has given the matter some attention and it seems likely that the excursion will start from some central southwestern point about the third week in June. The date has not been definitely set. About 100 bankers made the trip last year, but there were about 600 who were not able to go. The bankers who will make the trip will be chiefly from southern Wisconsin counties and the purpose of the tour is to convince these bankers of the loan value of Upper Wisconsin farm property. Those who went on the last trip were very easily convinced of Upper Wisconsin farm values.

E. R. Jones, secretary of the Wisconsin Drainage Association, will conduct a series of lectures, demonstrations and conferences on the subject of drainage at Madison during farm and home week, February 11th and 12th. As suggestions of a few difficulties to be met and considered in tile drainage work, a statement from Mr. Jones is given in the following paragraphs:

As roots of trees often clog tile, it is best to remove trees that are near the drainage line.

In muck or peat soils, tile should be laid below the frost line, because these soils may expand enough on freezing to heave the tile to a damaging degree.

Unglazed tile are just as good as glazed tile except where an outlet is exposed to the weather. At such points glazed tile or wooden flumes bear the exposure with the least injury.

Tiles, the walls of which can be split into thin flakes, or those containing specks of lime are to be avoided. When laid, four-inch tile, with walls five-eighths of an inch thick, are just as good as heavier tile, but, of course they are subject to breakage by handling. The breakage, however, should not exceed 4 per cent.

"Boosters for the breeds" will meet at Madison on Wednesday, Thursday and Friday of the Wisconsin Farm and Home Week, February 7th-12th, to transact business and to congratulate themselves upon a successful live stock season in the face of rather adverse conditions. Besides the regular session of the Wisconsin Live Stock Breeders' Association there will be meetings, special or regular, of the following breed organizations: Wisconsin Aberdeen Angus Breeders' Association, W. A. Connell, Menomonee Falls, secretary; Wisconsin Shorthorn Breeders' Association, J. L. Tormey, Madison, secretary; Wisconsin Red Polled Breeders' Association, L. C. Underwood, Avoca, secretary; Western Guernsey Breeders' Association, Charles L. Hill, Rosendale, secretary; Wisconsin Holstein-Friesian Breeders' Association, Chris Schroeder, Racine, secretary; Wisconsin Horse Breeders' Association, J. G. Fuller, Madison, secretary; Wisconsin Sheep Breeders' Association, Gavin McKerrow, Pewaukee, secretary; Wisconsin Berkshire Breeders' Association, J. H. Kitchen, Eldorado, secretary; Wisconsin Duroc Jersey Breeders' Association, J. D. Grant, Delavan, secretary; Wisconsin Poland China Breeders' Association, E. E. Jones, Rockland, secretary; Wisconsin Chester White Breeders' Association, A.

(Concluded on page 14.)

THE FARMER'S OPEN FORUM

Believes Wheat Will Go Higher.

To the Editor:—It is common talk among the best farmers that there is a great deal said in the farm papers about how to produce a large crop, but very little about how to get a good price for it—a very essential thing. All large grain dealers, exporters and speculators have their agents in the grain-growing states circulating "bearish" news and urging the farmers to dump their wheat on the market early at about the cost of production, and then they buy it and hold it for a high price, making millions of dollars that the farmers should have and would get if the farm papers would come to the rescue and issue a word of warning against these robbers of the fruits of the farmers' toil and advise them to hold for a better price.

The farmers write you instead of complaining among themselves. But the farmer who keeps posted and knows the conditions and would write is not fooled by these paid agents and so-called statisticians in the employ of the speculators. He sets the price and holds for it, but it is the thousands who are not well informed in the world's wants who need your help and advice.

When the farmers were dumping their wheat on the market at between 90 cents and $1 one farm paper advised them to set a minimum price of $1.25 per bushel. Many of them took the advice and had the pleasure of seeing the price climb up to that point. And now this and all other farm papers can safely say that if enough farmers will hold for $1.50 per bushel they will get it long before the next harvest.

By a united effort of the farm papers millions of dollars per annum could be saved to the producers and thus gain their everlasting gratitude. The consumer is not benefited by these low prices, for he pays the speculator's price.

The government monthly report makes a big display about the bumper crop and record yield, but not a word about the millions of bushels of wheat made unfit for market by the wet harvest, or the decreased acreage this year, or the greatest world's war in history and the millions of soldiers to be fed, causing the greatest demand for foodstuffs the world has ever seen, but lets the report go to the public in a one-sided manner to the interest of the speculator and against the producer.

The farmer sees but little in his farm paper about the unprecedented world's condition that causes the greatest demand for foodstuffs the world has ever seen, with the resultant high prices to follow, and lets the wheat go out of his hands. Then the speculator takes advantage of the situation and makes millions of dollars that the farmers could have made if they had set a good price and held for it.

You are at liberty to publish this letter if you wish and ask the farmers if they want the millions that the speculators make. If they do and will ask for it they will get it.

Madison, Indiana. A. S. Custer.

Both Stump Pullers and Dynamite.

To the Editor:—We have millions of stumps in this state. We would all like to get rid of them, but we don't all agree on what is the best way.

I believe in dynamite myself. I have found it cheaper, quicker and more of a labor saver than any other method.

A good many men swear by stump pullers. I ran across a farmer a short time ago that was using one. Asked him about what it was costing him per acre to clear his land. He said about $20. I asked him if it would be worth $12 per acre to him to have them loosened and split so that they could be easily pulled. He said it would, so I blasted for him a day and a half in which time I finished two and three-quarters acres. The next day we were able to pull two acres because the stumps came out easily.

This farmer then admitted that it paid to use dynamite to assist his stump puller. What do your readers that have cleared land think of this? Don't most of them think this is the best way? Otto Samuelson.

Galloway, Wisconsin.

Recipe for Soap Making.

To the Editor:—As I read in your last paper that a recipe for good soap is asked for, I will send you one which I have used for years and passed on to a good many friends. It makes the washing easy, besides there is no settling or left overs.

But to make soap out of skins or hog meat is something I never heard of, as neither skins or meat have any lard or grease. If anyone wants soap out of such as that they ought to boil it first and set to cool and take off the grease and see how much fun it is, for otherwise there will be no soap. But there will be no settling in soap, as all scraps of meat will float on top after it has boiled and can be taken out of the soap with a skimmer. My recipe is:

32 quarts of rainwater.
4 boxes lye.
14 pints of lard or tallow, free from salt and melted.
2 pounds of borax.
2 pounds of rosin.

Put all in a big kettle, boil for an hour and twenty minutes, then dip in molds or a flat box and cut when cold.

This makes about a bushel of soap good enough for a king.

Mrs. John Fritz.

Dodge Co., Wisconsin.

A short course conducted in 1913 in a north central Wisconsin county by the agricultural representative led a student to undertake the remodeling of the home barn, the construction of a manure pit, the rearrangement of crop rotation schemes and a good start with alfalfa, all of which has added to the permanent value of the home place.

A seed corn selecting excursion was recently made up in Eau Claire county with the county agricultural representative in charge. By actually husking the corn, weighing it and making their own determinations the class was more forcibly impressed with the importance of seed selection and breeding than would have been the case had they simply listened to lecturers or read books on the subject.

John Deere Implements

John Deere Corn Planter

The Accurate "Natural Drop" Planter

ACCURATE—because it has the "Natural-Selection" drop—an improvement over all other methods.

Kernels do not have to be tipped on edge to enter the cells. Surface of hopper bottom and openings to seed cells are oblique, or sloping. The kernels naturally move toward and fill the cells.

A full—variable drop planter. Plants two, three or four kernels as desired—all you do to change number in the hill is to move foot lever.

Drilling distances varied, and change from hilling to drilling or back to hilling made just as easily.

All corn plates for this planter have 16 cells. Therefore, the same drilling distances are obtained with one plate as can be secured on other planters that require 8, 12 and 16 cell plates.

The gears are always in mesh and can be shifted at any time (even when in operation) to change drop or drilling distances.

Investigate the John Deere tip-over hoppers, quick detachable furrow openers, underhung reel and disc marker without rope.

Write for free booklet, "More and Better Corn."

Van Brunt Drills and Seeders

With Adjustable Gate Force Feed

VAN Brunt Drills plant any small seed, alfalfa to bearded oats, peas or beans.

Amount sown per acre easily regulated merely by shifting feed gauge levers.

All the ground sown, because the Van Brunt adjustable gate force feed compels seed to leave hopper in even, continuous streams—no bunching or choking up—and an equal amount goes into each furrow.

An even stand of grain is secured, because pressure springs compel all the discs to cut furrows of equal depth, and the forward closed delivery places seed at bottom of these furrows.

Van Brunt Drills never clog up. Scrapers keep discs absolutely clean. The high grade discs have bearings that are guaranteed to last lifetime of drill.

Smooth running—each wheel drives half the feeds, equally distributing the work. A direct, double gear drive from the continuous axle.

Grass seeder attachment can be furnished which will drill or sow broadcast as desired.

Van Brunt Broadcast Seeders are just as positive in their operation as Van Brunt Drills.

Write us for free booklets describing Van Brunt Single or Double Disc Drills, or Broadcast Seeders.

John Deere Spreader

The Spreader with the Beater on the Axle

ONLY hip high to the top. Wheels out of way when loading. Mounting the beater on the axle is patented. Write for Spreader booklet.

Three exclusive John Deere Spreader features:

[1] Beater on the axle—nothing else like it. [1]

[2] Revolving Rake—load moving back to beater revolves the rake. Draft actually less. Even spread certain—no bunching. [2]

[3] Ball Bearing Eccentric Apron Drive—requires no attention. Performs wonders in the working of the spreader. [3]

John Deere Disc Harrow

The Flexible Spring Pressure Disc

MODEL B—the only disc that cuts at even depth its entire width. It has a patented spring pressure lever. With this lever, pressure can be regulated at inner ends of gangs to cut out dead furrows or disc ridges without burying the harrow.

The Model "B" does not crowd toward the bottom on hillsides or in overlapping. The gangs are independent of each other and can be given the proper angle to work right under such conditions.

Write for free booklet, "Bigger Crops from Better Seed Beds."

Dain System Side Rake

The Left Hand Rake

THE tool that is revolutionizing hay making. Left hand instead of right—follows the mower closely, places hay upon clean stubble and puts it in medium size windrows with bulk of leaves inside and majority of stems outside.

This means uniform curing and leaves don't dry up and fall off. They cure in the shade.

Hay is air-cured, not sun-scorched, retains its color, nutrition, feeding value and sells for more money.

Write for free booklet describing the Dain System of Air Curing Hay.

John Deere Dealers Everywhere

Better Farm Implements and How to Use Them

BOOK FREE—168 page reference book—tells all about a complete line of farm implements and how to adjust and use many of them. A practical encyclopedia of farm implements. Worth dollars. Describes and illustrates: Plows for Light Tractors; Steel and Chilled Walking and Riding Plows; Disc Plows; Cultivators; Spring Tooth and Spike Tooth Harrows; Lister Plows and Cultivators; Disc Harrows; Alfalfa and Beet Tools; Farm and Mountain Wagons; Teaming Gears; Manure Spreaders; Inside Cup and Portable Grain Elevators; Corn Shellers; Hay Loaders, Stackers, Sweep Rakes, Mowers, Self-Dump Sulky and Side Delivery Rakes; Hay Presses; Kaffir Headers; Grain Drills and Seeders; Grain Binders; Corn Binders; Gasoline Engines. This book sent free to every one who states what special implements he is interested in and asks for Package No. X-64.

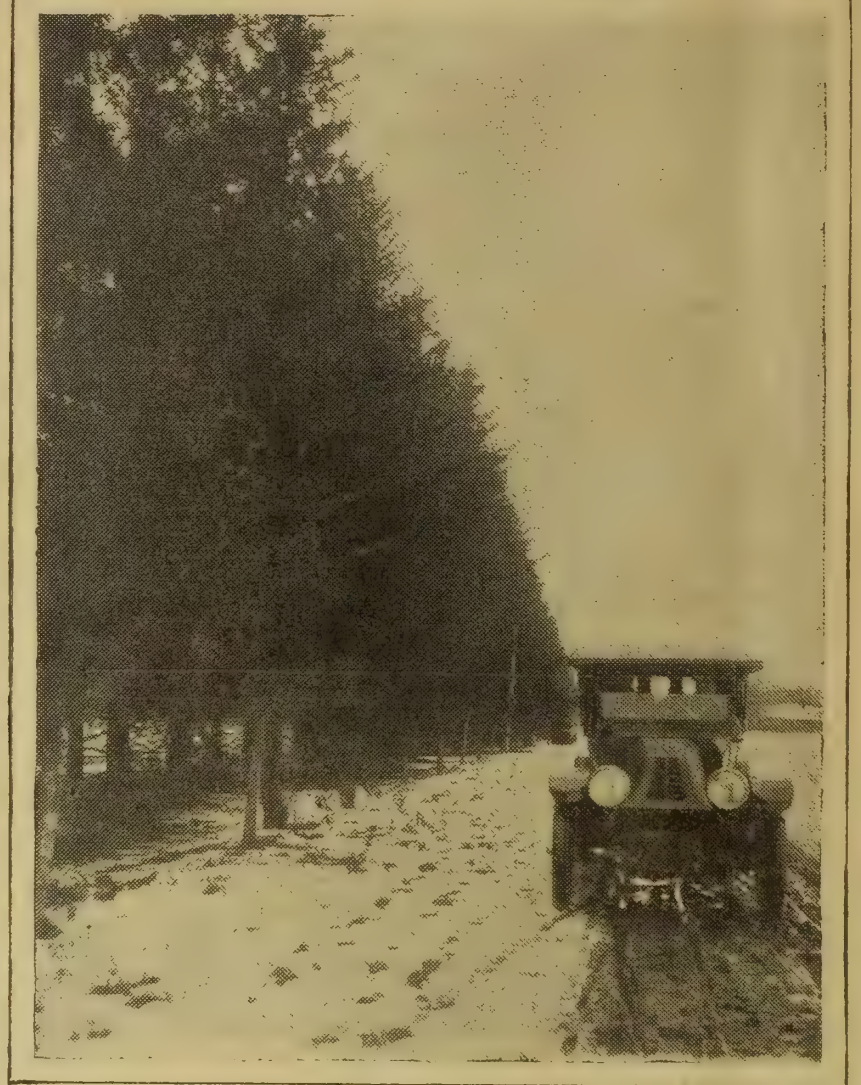
JOHN DEERE MOLINE, ILL.
THE TRADE MARK OF QUALITY MADE FAMOUS BY GOOD IMPLEMENTS

John Deere, Moline, Illinois

The Camera at Work in Wisconsin.

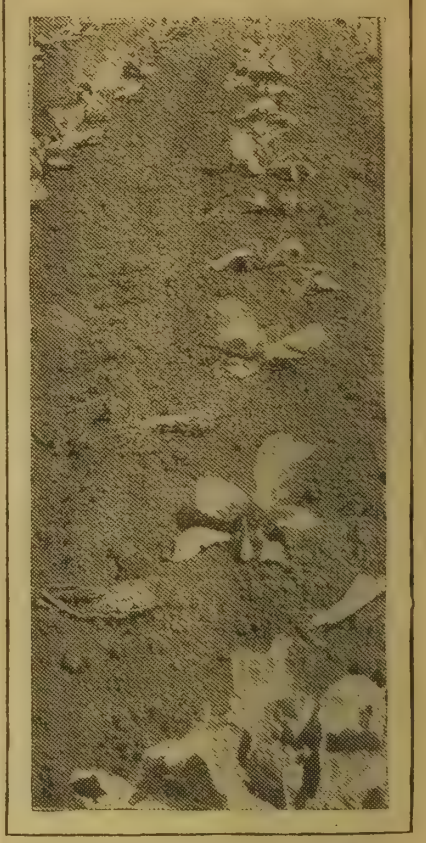
PROFITABLE CABBAGE FIELD.

Cabbage is a highly profitable crop in Wisconsin provided it can be raised free from disease. This cabbage was photographed when it was in fine condition and representative of the best that Wisconsin affords. It was grown on rich, deep black soil and in a well-drained field. This picture was taken after the first plowing.



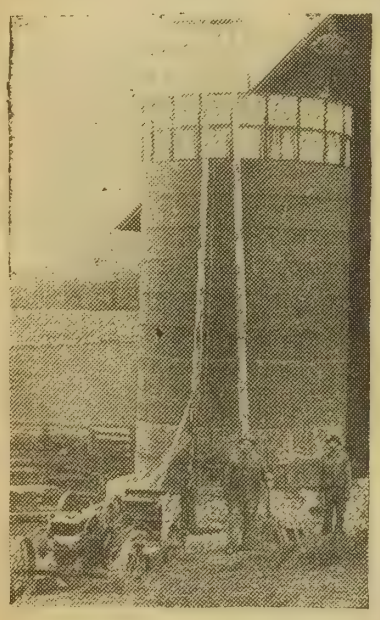
BREAKING WINTER'S WINDS.

This fine windbreak of Norway Spruce has been sheltering a farm home and set of farm buildings for a quarter of a century and is easily good for another twenty-five years. Many a Wisconsin farmer would be glad to have such a row protecting his place and his cattle from the chill winds of the north and west. A windbreak of this character is worth many times its cost. It is ornamental, but its greatest service is protection from winter. Farmers who do not have such a windbreak will do well to look into the matter. They are not expensive and evergreens will grow even and fine if properly selected. Care should be taken to get healthy looking young trees with a hardy stock and with plenty of roots. The strong root growth comes from transplanting and the evergreen taken from the woods is not likely to grow.



BEGINNING OF YELLOWS.

This was the second successive crop of cabbage on new land. Note the old cabbage stumps on the ground. The plant in the foreground is healthy, but the next eight in this row all showed "yellows." Note dwarfing and shedding of lower leaves. Probably a single plant in this place, possibly one of these stumps, was diseased the previous year. Spots like this, scattered throughout the field, mean the end of profitable cabbage culture on this land. The Wisconsin College of Agriculture has issued a comprehensive treatise on cabbage diseases and a copy of this bulletin may be secured by addressing Dr. L. R. Jones, Plant Pathology Department, College of Agriculture, Madison, Wis. The New Wisconsin Hollander disease resistant cabbage seed which is to be tried out this season may put an end to such patches as this in the cabbage sections.



SHAWANO COUNTY SILO.

This silo, erected on the farm of Ed Spriegel, Shawano county, Wisconsin, is 12x38 feet and has ample capacity.

WISCONSIN RED CEDARS.

It is charged the red cedar fosters apple rust. The dots shown in this drawing show the red cedar sections of Wisconsin. To get the best apples we must get rid of the red cedar in southern and western Wisconsin.

SCHOOL POTATO CONTESTS AND THE RESULT.

This picture illustrates what school children can do raising better potatoes when they get the enthusiasm which comes in contest work. This banner was won this year by Langlade county.

Waukesha Holstein Meeting.

Breeders Hold Annual Winter Session at the Resthaven Hotel--Prospects Bright For Good Year For Society Members.

THE eighth annual meeting of the Waukesha County Holstein-Friesian Breeders' Association was held on Tuesday, January 11th, at the beautiful Resthaven hotel at Waukesha. The attendance was large and representative and this meeting will go down in history as one of the most successful winter meetings in the history of this pioneer Holstein community organization in Wisconsin. All of the 130 breeders and their wives enjoyed the banquet at noon, which was a sumptuous feast, to say the least, and was followed by a program of splendid addresses.

A visitor to one of the meetings of this association does not have to wonder long why it has been so successful. Every member is a booster and an enthusiast for the Holstein cow and realizes that through community effort the greatest good is to be accomplished. The past year has been very successful for the association and with a good demand now in that county for Holstein females and bulls there is every reason to expect that the coming year will be very profitable to the Waukesha county breeders.

W. L. Baird, of Waukesha, secretary, reported that during the past six weeks there has been a big demand for stock and that five or six carloads have been sold during that period and that there are many inquiries now on file with the association. The forepart of the year saw a depression in the market for animals but Mr. Baird looks for a big winter business because of the big demand and many sales during the past few weeks. Interest in the Holstein in Waukesha county during the year has been especially keen, and 60 per cent of the 203 official tests made during 1915 in that county was in Holstein herds. Thirteen per cent of all the official testing done in Wisconsin was done in Waukesha county, which Mr. Baird said places that county second in the state in this respect. During the year the association handled 180 inquiries for stock. Female buyers came for carload lots while those in search of bulls to head their herds wished an opportunity for selection, and with many animals for sale these inquirers were able to travel about the county and usually find the bull they were looking for. Mr. Baird said that outside buyers of bulls always seemed better pleased when they could make their selections in this manner.

The meeting last week, as a result, was the climax to this good year in the industry and the attendance doubtless would have been much better except for the great amount of grip which is prevalent in that county as elsewhere. Five new members were admitted to membership, which brings the roll up to more than 140 members. Owing to plans for incorporating the association as a corporate body the annual election was postponed until January 22d, when a meeting will be held for this purpose at the courthouse in Waukesha at ten o'clock. The association will be incorporated without capital and the meeting on January 22d is to comply with the law and finally approve the incorporation. A nominating committee composed of E. E. Rosenkraz, of Oconomowoc; S. A. Baird, of Waukesha and Ed Schley, of Waukesha, was named to suggest officers for election at the coming meeting. New members elected were R. W. Bradford, of Dousman; Gustav Pabst, of Oconomowoc; Charles Chapman, of Waukesha; Joseph L. Walker, of Caledonia; and Stewart Reed, of Oconomowoc. The business meeting was held in the forenoon and several matters of importance to the association were brought up and considered.

S. Paul Jones, county secretary of the Y. M. C. A., outlined the plans for a county calf contest and asked the co-operation of the association which was given. Charles J. Will, of Menomonee Falls, president, was appointed a committee of one to represent the Holstein association, and the other breeders' organizations will be asked to co-operate also. It was the consensus of opinion that such a contest will prove of great value to the dairy industry, and as one speaker declared "calf raising is an art and a science and some of us who are no longer boys can learn a great deal ourselves." The plan is to include both the dairy and beef breeds and all boys between the ages of ten and eighteen years will be eligible. They will take a calf at birth and rear it until it is five or six months old. In addition to being in the county contest the boys will be eligible for the state contest. The prizes will be awarded on the basis of 25 per cent to trueness of type of the breed; 25 per cent on the daily gain; 25 per cent on the economy of production and 25 per cent on the record kept by the contestants.

WAUKESHA COUNTY BARN.
On the Charles J. Will farm near Menomonee Falls. Mr. Will is president of the Waukesha County Holstein Breeders' Association.

S. S. Cramer, of Milwaukee, vice president, outlined a plan for Waukesha county to secure a director on the board of the national association at the meeting in Detroit in June and was delegated to carry the proxies of breeders who could not attend. Mr. Cramer urged that every breeder who could possibly do so attend this national gathering and said that at least twenty members of the association should make the trip. "If that many can go we will certainly put Waukeshe county on the map," he said.

The Holstein breeders also approved the campaign for a county agricultural representative which it was pointed out could be of inestimable value to the breeders as well as to the general farming industry of the county. The county board voted down the proposal at a recent meeting but it is thought that such a representative can be secured at a reconsideration of the subject as the defeat, the breeders believe, was due to the board members not being fully acquainted with all the facts.

Following the banquet served at noon Prof. E. B. Hart, head of the agricultural chemistry department at the college of agriculture, spoke on

(Concluded on page 21.)

Why Wait Until Spring?

THERE will be a shortage of all good cars in the spring—**everybody familiar with conditions is sure of that.**

So it's best to order now and be certain to get your car—**when you want it.**

This is especially true if you have made up your mind to have a KisselKar High Efficiency Four—the 100,000 mile car—and we are sure it will be a Kissel if you dig deep into motor car values.

Here is a car unequalled in power, roominess, comfort and beauty, built according to Kissel standards, for only $1050. The price alone is not significant, but the price with Kissel quality means great big, unmatchable value.

KISSELKAR
EVERY INCH A CAR

The KisselKar is noted for its splendid engine—a simple, powerful, flexible motor that will pull you **everywhere.** *We mastered the building of engines long before we made automobiles.*

Kissel-built axles too are famous; while you often hear of axle trouble in other cars, you never hear of it in a KisselKar. *All vital parts are made in our own factories.*

Everything is substantial—built for strength and wear—choice materials, liberal bearings, reliable brakes, solid construction down to the smallest detail.

Then there's the ALL-YEAR Car with the Detachable Top, which you can use as a closed car in winter and a touring car in summer—two cars in one.

Send for literature at once and make your decision early.

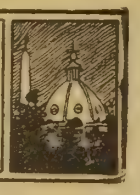
CURRENT EVENTS



THE massacre of nineteen Americans (employed in Mexican mines) by a general of the Villa faction, has resulted in threatened intervention again in Mexico and by urgent demands upon Carranza for an immediate investigation of the whole affair. Senator Stone, of Missouri, chairman of the foreign relations committee, publicly admitted that if Carranza, after a fair trial, failed to protect foreigners in Mexico intervention was inevitable. Secretary Lansing, after sending a demand for satisfaction to General Carranza, issued a statement declaring it was to be deplored that the Americans had not followed the state department's warning against exposing their lives in the guerrilla warfare region. The nineteen men were taken forcibly from the train upon which they were traveling, were lined up and shot down in cold blood. The act is said to be in general line with the Villa policy not to permit foreigners to return to Mexico and resume their work so long as Carranza is being recognized by the United States and other nations as the head of the government. Mexican affairs promise to be troublous once more, with stirring times ahead unless Carranza handles things firmly.

CETTINJE, the capital of Montenegro, the little Balkan kingdom which has never been conquered in all its history, now seems likely to suffer the fate of Belgrade, capital of Serbia, and to fall before the onrushing Teutons. At last reports they had captured an eminence but five miles from the capital and were sweeping irresistibly onward. As in Serbia's case the British and French press finds it inexplicable why Italian assistance was not sent long ago to Lovcen, Montenegro, which, it is said, easily could have been rendered impregnable. The reduction of Montenegro, the press points out, will enable Austria not only to command the Adriatic, but also to threaten the flank of any advance from Saloniki and prevent any effective move by the entente forces through Albania. For Italy the new Austrian success has a most serious aspect. The long, narrow Italian peninsula is peculiarly vulnerable to an attack from the sea. While this victory is being scored for the Teutons in the Balkans, the Russians continue to be active once more in Galicia, where extremely bloody fighting is in progress. It is doubtful, however, if the Russian gains there are sufficient to offset the German-Austrian gains in the Balkans, while during the week the English have abandoned the Dardanelles campaign altogether, withdrawing all their men, being unable to push the Turks from their fortresses and force the straits.

ENGLAND is face to face with compulsory military service for the first time in its history. The conscription bill, agreed upon by the cabinet, passed the house of commons last week by a vote of 403 to 105. The tide was turned toward victory by the appeal of Lord Balfour, head of the admiralty, who pleaded with the lawmakers: "Let this vote tonight show that we are a united people. Do not let us give a false impression to the world that in the moment of the country's greatest emergency we are divided one against another. Abandon your abstract theories, and remember we are dealing with stern realities which call for great sacrifices." The bill has not yet become a law, but unless the sentiment of parliament undergoes a marked change it will soon be a law. There has been some talk of putting the matter up squarely to the people in a general election, but the government will hardly go to this extreme, notwithstanding the fact that the British unions are almost a unit against conscription. Organized labor, sitting in congress at London the very day the house of commons passed the conscription bill, decided against the government's action by the overwhelming vote of 1,998,000 to 783,000. The labor congress was in many ways the most important body of the kind ever assembled. More than 1,000 delegates were present, representing 400 unions and 3,000,000 workers. In addition to the formal vote against the government's compulsion bill, the congress rejected by four to one a motion pledging support to the principle of compulsion for single men, and passed by two to one another motion directing the labor party to oppose the bill in all its stages in the house of commons.

THE progressive party will hold its national convention in Chicago on June 7th, the date and place being the same as that selected for the republican national convention. The idea of the progressives is that perhaps both parties may agree on the same candidate for president. This action was decided upon last week. Forty-seven of the forty-eight states were represented at the meeting. Before adjourning the national committee adopted a declaration of principles in which the administration of President Wilson was criticised for its alleged failure to deal adequately with national honor and industrial welfare, and the progressive party went on record as favoring a complete preparedness consisting of military armament as well as a mobilization of all the country's resources with a view of the unification of American citizenship. A message was read from Col. Theodore Roosevelt urging the necessity for adequate preparedness which was enthusiastically applauded. The action of the progressive committee will undoubtedly boom the presidential stock of Theodore Roosevelt, who has been flirting with the republican nomination for some time past. Should the republicans name him as their standard bearer the progressives would undoubtedly do the same, presenting a united front to President Wilson and democracy.

GERMANY has finally and positively agreed to pay an indemnity for the Americans lost in the Lusitania disaster, bringing to an end the long-drawn-out diplomatic negotiations on this subject and restoring the friendly relations between the two governments. Under the terms of the proposal submitted for the approval of the United States, Germany, while offering to pay an indemnity, makes the reservation that no admission of wrong doing thereby is involved. It is contended that the Lusitania was sunk as an act of reprisal for the British blockade of Germany. While Secretary Lansing is understood not to have indicated to Count von Bernstorff whether the proposal was satisfactory a number of officials in a position to be familiar with the American attitude indicated that it would be accepted. While the German situation is thus cleared, the Austrian remains obscure, with official Washington hoping things will terminate as satisfactorily as they have done with the kaiser's government. In the meantime, Austrian submarines continue active in the Mediterranean, directing their energies mainly against freight and troop ships, however.

THE United States Supreme Court has ruled that congress has a perfect right to restrict interstate shipments of drugs which are falsely labeled with claims for cure-all qualities which they do not possess. This puts the pure food and drug law on a firm and stable footing, so that it can be rigidly enforced. The litigation which is now ended has been in progress for ten years. It is expected that numerous actions against drug concerns will immediately ensue. For a time it was urged by government officials that the 1906 pure food law designated as misbranded drugs or medicines which were accompanied in interstate commerce by knowingly false statements about the curative effects of the compounds. The supreme court decided, however, that the 1906 law applied only to misbranding as to the identity or composition of drugs. In response to a resulting message from ex-President Taft, congress in 1912, enacted the Sherley amendment which the supreme court now holds struck precisely at misstatements either on the label or in printed circulars accompanying medicines. "We find no ground," said Justice Hughes, "for saying that congress may not condemn interstate transportations accompanied by false and fraudulent statements as well as lottery tickets." The harmful effects of misbranded drugs, which arouse unfounded hopes in the minds of the sick, can hardly be overestimated. Congress and the courts have now put an effective stop to this swindling.

PRESIDENT WILSON'S ideas on an all-American policy, which shall bind the United States still closer together with the nations of Central and South America, were outlined in a speech which he delivered last week. The program outlined by the president proposes that all the American nations, large and small, shall do the following: Unite in guaranteeing to each other absolute political independence and territorial integrity. Agree to settle all pending boundary disputes as soon as possible by amicable process. Agree to handle all disputes arising among them by patient, impartial investigation and to settle them by arbitration. Agree that no revolutionary expedition shall be outfitted against or supplies for revolutionists shipped to neighboring states. "These are very practical suggestions," said the president, "and I, for my part, believe that they are going to lead the way to something that America has prayed for for many a generation." He said the Monroe doctrine had been and always would be maintained by the United States on its own authority but that the doctrine did not disclose what attitude the United States would assume toward other nations of the hemisphere, and consequently the other nations had been distrustful of it. The president proposes to make the Monroe doctrine apply as well to the nations of the Americas in their relations with each other as to the nations of Europe in their relations to any of the countries of the Americas.

SOME MARKETING PROBLEMS

Notes From an Address by B. H. Hibbard, of Wisconsin College of Agriculture, Before Grain Dealers of Nebraska.

DID it ever occur to you that price fixing at your home town is more often of consequence, or of more consequence, than that of the distant market. For example, the estimates of savings due to the establishment of co-operative elevators varies from 2 to 6 cents a bushel on all kinds of grain. Taking as a rough compromise 3 cents, and reckoning the average price of all kinds of grain at 75 cents, we have an added income of 4 per cent from all the grain fields of 30,000 farmers. This margin is a very important one representing a clear grain probably equal to the net profits of a vast number of these grain growers. The co-operative elevator movement has put out of business the great share of line elevators of the country, and by by so doing has reduced the possibilities of price-fixing in the grain business by certainly more than 50 per cent. Under the methods of the line elevators the shading of a price for wheat to the extent of 5 cents a bushel was not a hard matter. The farmer, half of the time, did not know the grade of the wheat. He did not know how much dirt it contained, and certainly did not know how it was regarded by the millers as a material for making flour.

With all of these unknowns it was not a difficult matter, where competition was quiet, to make the farmer believe that he was getting the full value of his product when as a matter of fact he was getting well below that amount. This was much easier than fixing prices in the central markets where eager millers and exporters were bidding for grain, and where price-making forces were balancing the scales between supply and demand. Should we come to the point some day of using all our wheat at home, and should a tariff wall protect us from the foreign product it would conceivably be possible for the millers to get together, squeeze out the little fellows, monopolize the business, and to get together, squeeze out the little fellows, monopolize the business, and set prices. This is substantially what has been done in other fields. It is what a great many people think has been done in the case of the packers and the meat supply. However, an inquiry carried on for ten years by the government against the packers brought little of a convincing nature to light. But we do not have to go to Chicago to find price-fixing in the live stock market. It is often more easily found nearer home. Not so often in the vicinity of Omaha, or anywhere within the great stock feeding districts as around the fringes of this district, however. Here are some undoubted facts.

A stock shipper in a neighboring state found the business profitable, and decided to have a goodly portion of it to himself. He put men at each of half a dozen stations, gave them an interest in the business and outlined the plan to be followed. Where there was little competition he took $1 margin on hogs and cattle, and $2 or $3 on calves. Where competition developed he satisfied himself with less and was especially skillful in getting his opponent to bid more than stock was worth and letting him have it in large amounts. For example, in one case, this monopolist lost $5,000 at a given station one year, but for several years after that he made $5,000 a year, with expenses not a third of that sum. He has substantial control of the business in six stations in a row on one line of railroad. At one of these he broke up a farmers' co-operative company. This he did by paying so much that there was an advantage in co-operative operations. The company is likely to remain a long time dead, and he can recover his extra investment at leisure.

In another case a group of farmers having a large number of veals for which they had never received over 6 cents a pound organized a co-operative company, and during the first two years received 8 cents on an average. Here was price fixing with a vengeance. Had there been anything a quarter as big as this in the packers' profits the government investigations should have been able to make out a case in a tenth of the time they were at work. Whatever case may be made against the packer it has to be admitted that their prices go up and down with logical curves conforming pretty well to receipts. This does not prove that they do not have an undue advantage in price making. It does, however, suggest very strongly that he does not have a perfectly arbitrary and free price-making privilege. At all events out of the wide margin of 40 per cent between the farmers' and the consumers' price, taken as 100 per cent, the retailer gets twice as much as does the packer.

Without doubt it is easier to fix prices in the small town, in the retail trade, than in the wholesale trade in a city. For example, a few store keepers get together and agree in a friendly way to sell certain canned goods at 10 cents straight instead of three for a quarter. There is not one chance in ten that their customers will either find it out or quit trading with them in case they should. Yet in this little agreement a difference of 20 per cent has resulted. Or one merchant may take the lead and others follow, thus making any sort of agreement unnecessary. This leading merchant not infrequently sets his prices a full 10 per cent above those of neighboring towns, and yet his customers do not, except in rare cases, go to the neighboring towns to trade, and the smaller merchants of his own town follow his lead in their charges.

The reason why their price-making forces work so well in the small town is in some respects similar to the case of the grist mills run by water power. In all the early years of such work the dams were made on the small streams. Every tributary of the upper Mississippi had its mill; the main stream was not dammed until a very few years ago. Now the power furnished at Keokuk is greater than that of all the little streams above it, but this is true only because the utilization of the little streams is unprofitable, for there is more power in them than in the great river itself. In the case of price fixing the situation is not quite analogous. It is still profitable to get everything possible out of the little branches. Our greatest waters are near home.

In one line of business in Wisconsin, involving price fixing, we have made a careful study. This is in the cheese business. Here we have an industry involving some $25,000,000 a year. It was the belief of many farmers that the prices of cheese followed the self-interest and caprices of a small group of cheese dealers who thwarted the operation of the law of supply and demand. These men who seemed to occupy such a powerful position in the market were accused of putting prices down just as the heavy rush of production began in the early summer when it was time to buy for storage, and after the storage houses were full, perhaps in November, these gentlemen arbitrarily raised the price to a convenient figure at which to sell not only the current product but millions of pounds which they had stored during the summer. One of these men in the year 1912 paid a state income tax of $853, which you will agree suggests a rather large income for a man in a small country town. He had speculated in cheese; the price had advanced; he had reaped a reward. The summer of that year brought matters to a crisis. One morning in May the cheese dealers met in a board meeting. It was presumably an open board on which cheese was freely offered and purchased. Those who had done so well for a few years had apparently decided that it was too good a thing to pass around liberally, and had made it harder for a new buyer to enter. On this particular morning things seemed about as usual to the observer. Cheese had been selling at 15 cents. It was time to expect some decline but no one was prepared for what happened. The highest bid was 12 cents. The price for a week at least was thus lowered 20 per cent. On the amount of cheese then coming into the market this was enough to cut off $15,000 in the payments to the farmers of a single county.

How, it will very properly be asked, were these men, some fifteen in number, able to make such a change in the price. They had for the moment been able to exclude other buyers, and, therefore, having the market to themselves, became the price makers. What would such action do with reference to other market forces? To begin with a farmer asked one of the dealers if it would not have been wiser to let the price down more gently and avoid the shock of such a sudden crop. "Yes," said he, " that is what I told the rest of the dealers." There were three possible outcomes. One was that nothing in particular might have happened. The farmers might have accepted the cut as they had many times before, and the consumer would have had no advantage from it, the margin being absorbed by the dealers. A second possibility was that other dealers and wholesale merchants might have broken into the market and raised the price, thus breaking up the monopoly of the members of the board. The third possibility was the one that did happen, the farmers broke away from the leading strings and made their way to the general market, leaving the board out.

The story of the farmers' cheese selling organization in Sheboygan county, Wisconsin, is one full of information respecting the relation of the producer to the middleman and the consumer. Briefly stated the farmers organized half of the cheese factories of the county into a federation. They put up a warehouse and cold storage building costing over $25,000; hired a manager at $2,500 a year, and went into the business of selling cheese to the wholesale trade. They now have two years of history behind them. They have handled some 7,000,000 pounds of cheese a year, at a saving of a quarter or half cent a pound. What about the 3 cents, or even the 1 cent of which they talk? Let us see what happened to the cheese dealers. Even before the farmers' company was started the princely incomes of the cheese dealers vanished. Not because of the opposition but because the facts of the market went against them. The man who had paid $853 income tax, next paid $53, then was bankrupt, then died, it is said because of worry. Cheese failed to rise in price in the winter, speculators lost. The farmers do not speculate. They do not sell so as to gain much of the spread of 12 cents between producers' and consumers' prices. They sell to the wholesale trade at a small saving. Best of all they have learned what the market for cheese really is. They now know what can be done and what cannot. The little game of price fixing has been exposed, and the farmers are marketing intelligently. But the necessary middleman costs still absorb the main part of the 12 cents. The retail dealer gets nearly half of it, and the cheese producers cannot go into the actual business. The solution of that riddle is another story.

Schoolhouse lectures, illustrated with lantern slides and movies are a feature of the local work of G. R. Ingalls, Eau Claire county's agricultural representative. Live stock, dairying, potato diseases and farmers' club organizations were the topics discussed at recent meetings.

THERE'S A DIFFERENCE

Commission firms are not all alike, any more than all doctors and lawyers are equally successful. All commission firms, however, charge alike for their service—the best costs you no more than the poorest. The salesman's work is what counts in your net proceeds. Get the most money for your live stock by consigning to CLAY, ROBINSON & CO., who have the salesmen and facilities for getting top market prices.

Our weekly Live Stock Report, invaluable to feeders and shippers, sent free upon request. If you care to state what you are feeding for market, special information and advice will be given by letter. Address our nearest office.

ROLLER FEED MILLS

GRIND A WAGON LOAD OF FEED FOR 10 CENTS.

THIS is the **Famous Howell Roller Mill** you have heard so much talk about. The new improved mill for the scientific grinding of grain. Old style Burr and Stone Mills are out of date. Thousands of them are being annually replaced by the Famous Howell Roller Mills. Grinds twice as fast as the best burr mill made. Does not heat the feed. Grinds Graham and Rye flour as well as feed. Has big capacity. Requires little power. No burrs or stones to wear out. Guaranteed to last a life time. Made in 13 sizes suitable for any size engine. Save one-half your time, gasolene and money by using a Howell Roller Mill. Write for catalog D.

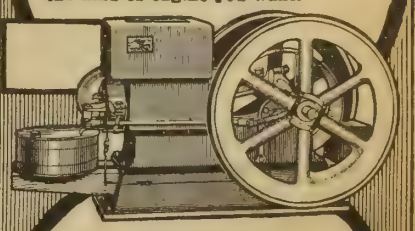
R. R. HOWELL & CO., Mfgrs., Minneapolis, Minn.

Meco ENGINES

Gasoline, Kerosene & Gas

Prove Their Quality

Write us, giving dealer's name and we will tell you how to get a high-grade **Meco** Engine for trial, and send you our Engine Catalog to select the kind of engine you want.



COSTS YOU LESS

2 H-P, $35.10; 3 H-P, $52 65; 4 H-P, $70.20; 6 H-P, $100; 8 H-P, $140.40; 12 H-P, $210.90.

Built for hard, heavy work, compact, easy to run; few parts, and save their cost in fuel first year.

Guaranteed 5 Years

Don't pay more than our prices for any high-grade engine until you have tried the **Meco.** Write for Catalog today.

Thousands of Farmers Have Chosen this Watch

No. 217 Adjusted to temperature and 5 positions. $25 and up, according to grade of case.

Here is the watch that has proved the favorite among thousands of farmers who realize that their work calls for an out-of-the-ordinary timepiece.

—A watch with ability to stand the jars of jumping on and off wagons and all the hard knocks incident to plowing, chores and harvest time and still deliver lifelong accurate service.

—A watch that puts real service ahead of frills of finish, yet so handsome that anyone would be proud to own it.

Such a watch is our No. 217 shown here, designed and built especially to meet farm needs yet preferred also by many city people. A real leader in the justly famous family of

South Bend Watches

No. 217 is an unusually accurate timer. Sturdy and dependable. Compact in size. Reasonable in price.

Find out all about the remarkable qualities of this famous farm timekeeper and all other South Bend Watches by writing today for 68-page watch book which tells many interesting and valuable watch facts and pictures and describes the complete line of South Bend Watches. The book is free. A postal brings it.

The Purple Ribbon on South Bend Watches, as shown above, helps you know them instantly at your dealer's.

Farmers Studying Gas Engines.

Matter Is Considered of Such Importance in Wisconsin That a Special Course Has Been Provided for Farmers' Week.

A NUMBER of Wisconsin farmers of a mechanical turn of mind will take a six days' course in the construction and operation of gasoline and kerosene engines, tractors, and automobiles during the Farm and Home Week, college of agriculture, February 7th-12th.

The coming age of power machinery is felt in advance, and many foresighted farmers desire to become familiar with engines and learn to operate them without hesitation or lack of confidence in their own ability. To such men this course offers great opportunities, as the farmer-students will put on overalls and spend most of their time in actual work with many types of machines now so frequently used in various operations from pumping to plowing, and which make life on farms and in the homes more enjoyable.

The agricultural engineering department, where the course will be held, has splendid equipment for the work. Its main engine room, 60 by 100 feet, is filled with gas and kerosene engines and farm tractors of many kinds. The room is ventilated with a new system leading directly from each engine on the floor, thus doing away with noxious gases. There are in all twenty-three farm power engines of stationary type, ranging from one to eighteen horse power, three auto motors and four tractors from sixteen to thirty horse power capacity. Prony brakes are provided with which to make engine tests. All necessary equipment is at hand for extensive study in operating and repairing the various machines.

Besides F. M. White, head of the department, and president of the American Society of Agricultural Engineers, the course will be directed by P. S. Rose, assistant editor of The American Thresherman, who will give a series of lectures on carburetion and fuels. Former students, E. E. Jewett, now of the International Harvester Company; and H. E. Roethe, with the Fuller & Johnson Manufacturing Company, will assist in the instruction work, as well as Mr. Sauve, Mr. Griffith and Mr. Jones, of the department.

The program, as announced by Mr. White:

February 7th—Principles and Construction of Gas Engines, F. M. White. Laboratory work in engine construction. Carburetors, P. S. Rose.

February 8th—Ignition Systems, F. M. White. Laboratory work in timing valves and ignition, and outdoor engine operation. Carburetion and Fuels, P. S. Rose.

February 9th—High Tension Ignition Systems, F. M. White. Laboratory work in timing valves and ignition, and outdoor engine operation. Carburetion and Fuels, P. S. Rose.

February 10th—Magneto Ignition, F. M. White. Welding and tempering work, details of tractor construction. Babbitting and repair of boxes. Carburetion and Fuels, P. S. Rose.

February 11th—Tractor Types, P. S. Rose. Testing tractors in laboratory. Magneto Ignition, F. M. White.

February 12th—Good and Bad Features in Gas Engine Construction, F. M. White. Laboratory work in auto wiring and operation. Special trip to gas engine factories in Madison.

The course is limited to fifty students only, and those desiring to take the work should apply at once in order to make sure of a place. No fees whatever will be charged.

IN AND AROUND WISCONSIN.

(Continued from page 8.)

H. Kuhlman, Madison, secretary; Wisconsin Ayrshire Breeders' Association, Frank T. Stare, Ladysmith, secretary, and Wisconsin Hereford Breeders' Association, C. W. Thompson, Lake Geneva, secretary.

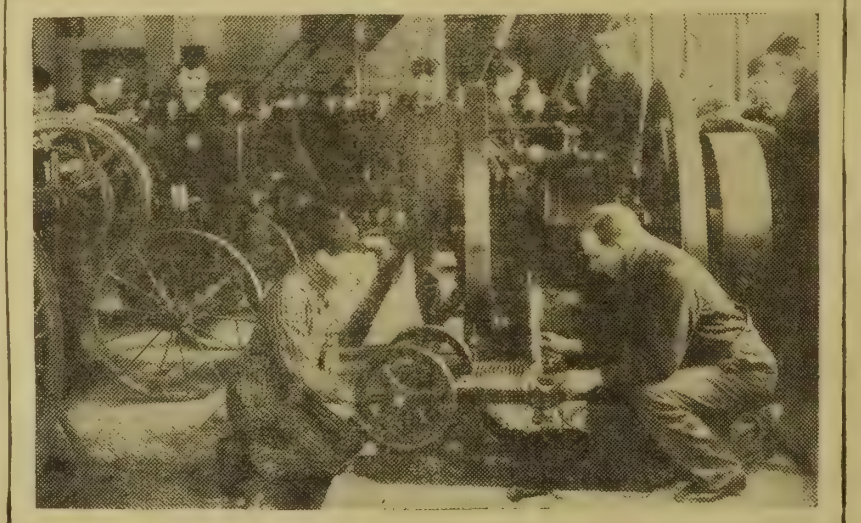
There is considerable interest throughout the state in the exhibit of the Wisconsin Agricultural Experiment Association, to be held at Madison February 11th and 12th. Winners of one or more premiums in previous exhibits will be barred from competing in the open classes of the grain show. The following is a list of those who have heretofore won one or more first premiums:

Oats—J. P. Bonzelet, Eden; E. T. Biggs, Fond du Lac; F. L. Dreger, Madison; V. G. Ellis, Evansville; O. C. Fethers, Manawa; F. B. Grebe, Fox Lake; J. H. Hendricks, Campbellsport; Chas. Howitt, Randolph; A. J. Klein, Lomira; H. F. Kramer, Bloomer; H. F. Marthaler, Beaver Dam; Gust Parsh, Wausau; Noyes Raessler, Beloit; J. H. Sattler, Rosendale; Otto Toepfer, Madison; H. T. Draher, Beaver Dam.

Barley—Anton Bohl, Beaver Dam; J. P. Bonzelet, Eden; E. T. Briggs, Fond du Lac; Chas. Howitt, Randolph; O. R. Jones, Beaver Dam; H. E. Krueger, Beaver Dam; J. R. Thorpe, Tavera; Otto Toepfer, Madison; Chester Wilcox, McMillan.

Corn—Andrew Finsness, Stoughton; H. T. Draheim, Gotham; F. P. Grebe, Fox Lake; Chas. Howitt, Randolph; V. W. Post, Sextonville; Renk Bros., Sun Prairie; J. R. Thorpe, Tavera; Ike Blood, Mukwonago; F. B. Jones, Alma Center; H. W. Longley, Dousman; S. P. Markle, La Crosse; Noyes Raessler, Beloit; H. E. Rosenow, Oconomowoc; J. E. Brunker, Ridgeway; O. R. Frauenheim, Random Lake; Wm. Schwandt, Deer Park; John Van Loon, La Crosse; George Leonard, Jefferson; W. P. Leonard, Fort Atkinson; Fred Grebe, Jefferson; W. R. Ward, Fort Atkinson; Joe Hans, Jefferson.

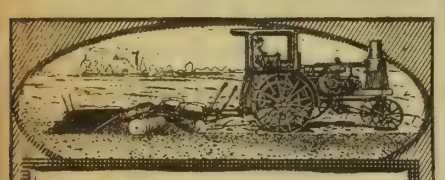
Pedigree Rye—Lloyd Hubbard, Evansville; Noyes Raessler, Beloit; A. L. Wagner, Haven; H. E. Krueger, Beaver Dam; J. M. Bohl, Beaver Dam.



STUDYING THE GASOLINE ENGINE.

The annual stockmen's "round-up" will be held in Madison on February 10th this year, when Wisconsin stockmen from all part of the state gather at Madison for the yearly sessions of the Wisconsin Live Stock Breeders' Association and auxiliary organizations. We are advised that the meetings this year will be of particular interest, especially so since none could be held last year on account of foot-and-mouth disease. Later notices regarding the details of the program will appear in these columns.

Read the poultry department of The Wisconsin Farmer. This week letters from prominent poultry raisers in this state are appearing. The series will be kept up for some weeks.



There Is a Size Avery Tractor to Fit Your Size Farm

WE build Avery Tractors to pull any number from 2 to 10 mold board plows. You can make your selection from the most complete line of tractors and plows built and can get a size outfit to exactly fit your needs.

No Other Tractors Have Met Such Tests

Introduced by Sold-On-Approval policy—entered in every big public contest and demonstration ever held—proved successful by thousands of owners. Avery outfits are built and backed by an established company owning a large factory and many branch houses, which insure your getting a well-built machine and having prompt and permanent service after you get it.

Avery Tractor success is due to these special features in their construction: Sliding Frames, Double Drives, 2-Speed Gears, Low-Speed Heavy-Duty Tractor Motors, Extra Large Crank-Shafts, Renewable Inner Cylinder Walls, no Pumps or Fan. Prices: 3-Plow Tractor, $760 cash; 4-Plow Tractor, $1120 cash, 5-Plow, $1680; 6-Plow, $2145; 8-10-Plow, $2475. Avery "Self-Lift" Plows and "Yellow-Fellow" Threshers are also built in sizes to fit any of the above size tractors. We also build a special smaller size tractor for $295 cash.

Write for new free 1916 Avery Tractor, Plow and Thresher Catalog and learn all the facts about Tractor Farming, Threshing, Road Building, etc., with an Avery Outfit.

THE HAPPY FARMER TRACTOR CO.

Only $550

Here It Is! A Practical, Low Price, Light Tractor

YOU can't afford to maintain horses that eat up profits in slack times—pull slowly—have off days—die on your hands—when you can get this remarkable tractor for only $550.

Happy Farmer Tractor is lighter by several hundred pounds than any tractor of equal power. Easier to handle—more economical of fuel. Special steering control—runs clear across field without attention—no self-guiding device needed. The frame of the

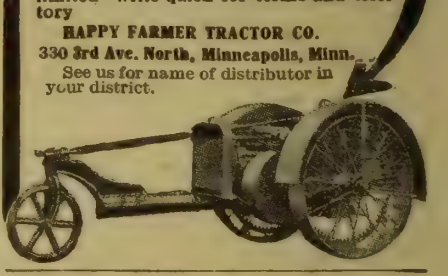
Happy Farmer Tractor

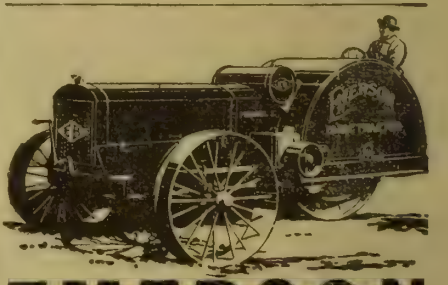
is a solid piece of cast steel—prevents racking—holds wheels, gears, motor, etc., absolutely rigid.

All the wear comes on wooden clutch shoes, pins and rollers—easily replaced at small expense. Largest part of weight on rear wheels—the proper place. Simple, durable, universally useful on the farm, the lowest priced *reliable* tractor ever offered. *Write for full details of this money-saving, labor-saving tractor*

Dealers The quickest selling tractor you ever saw—1916 output limited—write quick for terms and territory

HAPPY FARMER TRACTOR CO.
330 3rd Ave. North, Minneapolis, Minn.
See us for name of distributor in your district.





EMERSON Farm Tractor

Model L—12-20 Horse Power

A four-cylinder, 2-speed, light-weight tractor of great power, suitable for any size farm. Will pull the implements you now have on your farm—gang plows, harrows, mowers, binders, manure spreaders, road drags or graders. Will also operate your ensilage cutter, feed grinder, circular saw, etc. Does more work than horses—costs less and is so simple anyone can run it.

DU PONT FABRIKOID

MOTOR QUALITY

The Standardized Automobile Upholstery

DU PONT Fabrikoid, Motor Quality, is used on more than half of all 1916 automobiles.

Several years' use on hundreds of thousands of cars has proved its superiority over coated splits, commonly called "genuine leather."

Popular motor car prices are low because every detail of their manufacture is of *standard guaranteed* quality and cost.

Coated splits, weak and irregular in quality, durability and price, cannot be standardized.

Motor Quality Fabrikoid, uniform in quality, price, durability and handling costs, *is* standardized.

Insist upon Fabrikoid upholstery. Buy a standardized car and get the most for your money.

MORE FARMERS AT AUTO SHOW.

(Continued from page 7.)

seeing the value of the truck when there is much hauling to be done. Several light trucks were contracted for by several creamery companies in the state who will use the trucks for gathering the milk and cream the coming season. There seems to be a rapidly growing use of the truck for this purpose, as the creamery men are learning that it is to their advantage to get the raw product from the farm to the creamery as rapidly as possible and in the very best condition and the truck solves the problem, especially where the roads are in good condition. The representative of one body building concern said he had arranged for eleven state agencies during the show and an exhibitor of a trailer announced he had contracted at the show for the disposal of 200 trailers this year.

Everything from four to twelve-cylinder cars were on exhibition and the show in every respect ranked with that of New York and Chicago. About 4,000 feet of floor space in the Auditorium was devoted to the exhibits which were valued at $500,000, Seventy-nine manufacturers were represented by forty-two pleasure car exhibitors. There were 193 different models on exhibition with sixteen commercial vehicle exhibitors representing twenty-four manufacturers with forty models. In addition there were numerous exhibits of trailers, tractors, oils, gasoline, greases, spark plugs, etc.

None of the standard tires were exhibited per the agreement of the manufacturers to show only at the New York, Chicago and Philadelphia shows, but nevertheless the tire agencies reported a splendid business during the show from those who called at the Milwaukee salesrooms.

Inquiry by the writer at the Firestone Tire & Rubber Company branch on Jefferson street as to the advantage of the show to the tire business brought forth the information that trade conditions are splendid and that the coming year will be a record breaker in Wisconsin. The Firestone Company closed up many contracts with agents throughout the state and their show rooms were crowded during most of the time with agents who desired to look over the various lines while attending the show and before making their plans for the coming season. The display of accessories was very good and practically all lines, excepting the manufacturers of bearings, were represented. The Hyatt Roller Bearing Company, whose offices are in the Germania Building, did not exhibit, but their offices were the mecca for many supply men who came to the show and a good business was reported.

Milwaukee has a very live bunch of dealers in the Milwaukee association and much of the credit for the success of the show goes to the committee consisting of Frank J. Edwards as chairman, Bart J. Ruddle as show secretary and A. W. L. Gilpin and Jesse A. Smith. The auditorium was decorated to represent a Venetian garden and we doubt if a more ideal setting could have been provided for the half million dollars' worth of cars on display.

During the week the Wisconsin State Automobile Association held its annual meeting and decided to continue its fight for better roads. All members were unanimous in stating that the organization is doing splendid work for the motorists of the state and when they speak of motorists they include a large percentage of the farmers of the state. The association has practically fathered the good roads movement in Wisconsin and the campaign for a permanent system of highways will be continued.

WISCONSIN BUTTERMAKERS' ATTENTION.

To the Editor:—Attention is called to the fact that butter for the convention to be held at Eau Claire February 1st, 2d and 3d must be shipped not later than January 26th. The executive committee, as previously announced, will look up the date on the bill of lading and any shipment bearing a later date than January 26th will be entered for complimentary score only and will not be allowed to participate in the premium fund nor to compete for the prizes. In view of the fact that as in the past thirty district prizes are offered and also five state prizes it behooves all buttermakers to be careful to see that their butter is shipped on time. Judges will begin to score Friday, January 28th.

Any buttermaker who has not received his program with entry blanks, tags, etc., should write the secretary at Madison at once. Kindly bear in mind, so that there will be no misunderstanding, that your butter must be shipped not later than January 26th.

Also remember to get your twenty-pound exhibition tub at an early date. If for any reason you cannot get a twenty-pound tub send a sixty-pound tub and you will be reimbursed for the excess butter over the twenty-pound tub exhibition size.

G. H. Benkendorf, Sec.

Anticipating Telephone Needs

When a new subscriber is handed his telephone, there is given over to his use a share in the pole lines, underground conduits and cables, switchboards, exchange buildings, and in every other part of the complex mechanism of the telephone plant.

It is obvious that this equipment could not be installed for each new connection. It would mean constantly rebuilding the plant, with enormous expense and delay. Therefore, practically everything but the telephone instrument must be in place at the time service is demanded.

Consider what this involves. The telephone company must forecast the needs of the public. It must calculate increases in population in city and country. It must figure the growth of business districts. It must estimate the number of possible telephone users and their approximate location everywhere.

The plant must be so designed that it may be added to in order to meet the estimated requirements of five, ten and even twenty years. And these additions must be ready in advance of the demand for them — as far in advance as it is economical to make them.

Thus, by constantly planning for the future and making expenditures for far-ahead requirements when they can be most advantageously made, the Bell System conserves the economic interest of the whole country while furnishing a telephone service which in its perfection is the model for all the world.

HEPSEY BURKE---A Sister to David Harum.

By F. N. Westcott, the Brother of the Author of "David Harum."

(Copyright, 1915.)

CHAPTER I.

Hepsey Burke.

THE noisy, loose-jointed train pulled out of the station, leaving behind it a solitary young man, enveloped in smoke and cinders. In the middle of the platform stood a little building with a curb roof, pointed at both ends like a Noah's Ark; and the visitor felt that if he could only manage to lift up one side of the roof he would find the animals "two by two," together with the cylindrical Noah and the rest of his family. There was no one in sight but the station-master, who called out from the ticket office:

"Did you want to go to the village? The 'bus won't be down till the next train, but maybe you can ride up on the ice wagon."

"Thanks," the stranger replied. "I think I'll wait for the 'bus, if it's not too long."

"Twenty minutes or so, if Sam don't have to collect the passengers goin' West, and wait for a lot o' women that forget their handbags and have to get out and go after 'em."

The new arrival was good to look at—a handsome, well-built fellow of about twenty-five, dressed in a gray suit which was non-committal as to his profession, with a clean-shaven face which bore the unmistakable stamp of good breeding and unlimited good nature. He tilted his suitcase on end and sat down on it; then he filled his briar pipe, crossed his legs, and looked about to take stock of the situation. He gazed about curiously, but there was nothing of any special interest in sight, except, painfully conspicuous on the face of a grass terrace, the name of the village picked out in large letters composed of oyster shells and the bottoms of protruding beer bottles stuck in the ground. The stranger found himself wondering where a sufficient number of bottles could be found to complete such an elaborate pattern. The only other marked feature of the landscape in the way of artistic decoration was the corrugated base of an old stove, painted white, which served as a flower vase. From this grew a huge bunch of scarlet geraniums, staring defiantly, and seemingly fairly to sizzle in the hot, vibrant atmosphere, which was as still as the calm of a moonlit night.

As the man on the suitcase gazed about him at the general air of dilapidation and neglect characteristic of a country town on the down grade, and recalled the congenial life of the city which he had left, with all its busy competition, with all its absorbing activities, the companionship of the men he loved, and the restful, inspiring intimacy with a certain young woman, he felt, for the moment, a pang of homesickness. If the station were a sample of the village itself, then life in such a place must be deadening to every finer sensibility and ambition; it must throw a man back on himself and make him morbid.

The momentary depression was relieved by the station-master, who suddenly appeared at the door of the Ark and called out:

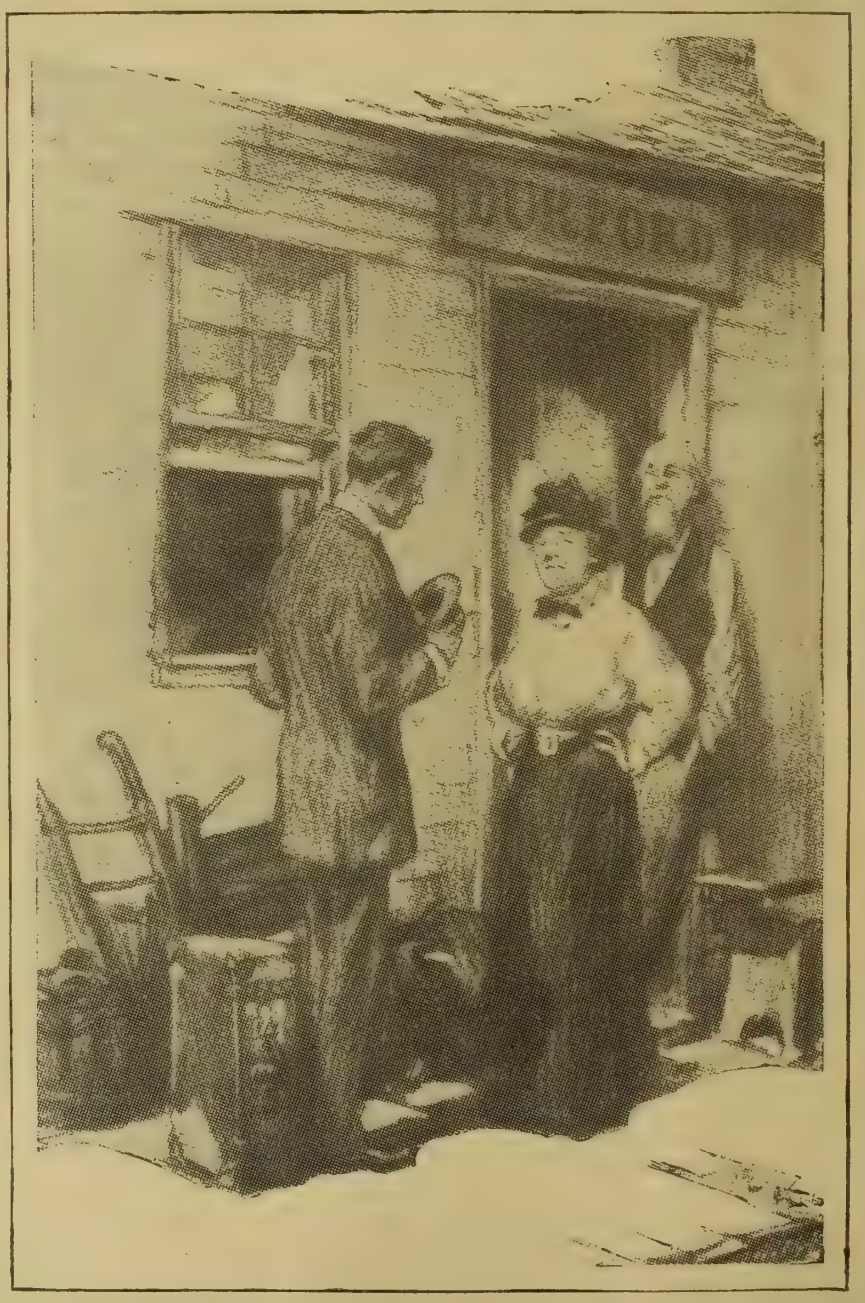
"Here comes Hepsey Burke. Maybe she'll take you up; that'll be a sight more comfortable than Lipkin's 'bus."

There was nothing to be seen but a cloud of dust, advancing with the rapidity of a whirlwind along the highway, from which there gradually emerged a team and a "democrat," containing a woman, a boy about fourteen and a middle-aged man.

As the turnout drew up the man took the reins from Mrs. Burke, who jumped out of the wagon with remarkable agility for one of her size and years, and, nodding to the station-master, came on to the platform.

Hepsey Burke was rather stout, and the lines from her nose to the corners of her mouth, and the wisps of gray hair which had blown about her face, indicated that she had passed the meridian of life. At first glance there was nothing striking about her appearance, but there was a subtle expression about the mouth, a twinkle about the large gray eyes behind the glasses she wore that indicated a sense of humor which had probably been a God-send to her. She was strong and well and carried with her an air of indomitable conviction that things worked themselves out all right in the long run.

The boy was obviously her son, and in spite of his overalls and frayed straw hat he was a handsome little chap. He looked at you shyly from under a little crop of curly hair, with half-closed eyes, giving you the impression that you were being "sized up" by a very discriminating individual, and when he smiled, as he did frequently, he revealed a set of very white and perfect teeth. When he was silent there was a little lifting of the inner brow which gave him a



"YOU HAVEN'T SEEN ANYTHING THAT LOOKED LIKE A PARSON, HAVE YOU? YOU CAN GENERALLY SPOT 'EM EVERY TIME."

thoughtful look quite beyond his years, and you were sadly mistaken if you imagined that you could form a correct impression of Nicholas Burke at the first interview.

The man wore a sandy beard, but no mustache, and had a downcast, meekly submissive air, probably the depressing effect of many years of severe domestic discipline.

Mrs. Burke was evidently surprised to find no one there but the man on the suitcase, but as he rose and lifted his hat she hesitated a moment, exclaiming:

"I beg pardon, but I was lookin' for a parson who was to arrive on this train. You haven't seen anything that looked like a parson, have you? You can generally spot 'em every time."

The young man smiled.

"Well, no; I seem to be the only passenger who got off the train, and, though I'm a clergyman, you don't seem to find it easy to 'spot' me."

Mrs. Burke, with a characteristic gesture, pulled her glasses forward with a jerk and settled them firmly back again on the bridge of her nose. She surveyed the speaker critically as she questioned:

"But you don't seem to show the usual symptoms—collar buttoned behind, and all that."

"I am sorry to disappoint you, madam, but I never travel in clerical uniform. Can't afford it."

"Well, you've got more sense than most parsons, if I may say so. Maybe you're the one I'm lookin' for: Mr. Donald Maxwell."

"That is my name, and I'm sure you must be Mrs. Burke."

"Sure thing!"—shaking his outstretched hand heartily. "Now you come right along with me, Mr. Maxwell, and get into the democrat and make yourself comfortable." They walked round to the front of the station. "This, Mr. Maxwell, is Jonathan Jackson, the Junior Warden; and this is my son Nicholas, generally known as Nickey, except when I am about to spank him. Say, Jonathan, you just h'ist that trunk into the back of the wagon, and, Nickey, you take the parson's suitcase."

The Junior Warden grinned goodnaturedly as he shook hands with the new arrival. But Hepsey continued briskly: "Now, Jonathan, you get in the back seat with Nickey, and Mr. Maxwell, you sit with me on the front seat so that I can talk to you. Jonathan means well, but his talk's limited to crops and symptoms, even if he is an old friend, my next door neighbor, and the Junior Warden."

Jonathan obeyed orders, and, as he got into the wagon, winked at Maxwell and remarked:

"You see we have to take a back seat when Hepsey drives; and we have to hold on with both hands. She's a pacer."

"Don't you let him frighten you, Mr. Maxwell." Hepsey replied. "Jonathan would probably hold on with both hands if he lay flat on his back in a ten-acre lot. He's just that fearless and enterprisin'."

Then, starting the horses with a cluck, she turned to Maxwell and continued:

"I guess I didn't tell you I was glad to see you, but I am. I got your note tellin' me when you were comin', but I didn't get down to the station in time, as the men are killin' hogs today, and until I get the in'ards off my hands I haven't time for anything."

"I am sorry to have put you to the trouble of coming at all. I'm sure it's very good of you."

"No trouble, not the least. I generally look after the visitin' parsons and I'm quite used to it. You can get used to 'most anything."

Maxwell laughed as he responded:

"You speak as if it weren't always a pleasure, Mrs. Burke."

"Well, I must admit that there are parsons and parsons. They are pretty much of a lottery, and it is generally my luck to draw blanks. But don't you worry about that; you don't look a bit like a parson."

"I think that's a rather doubtful compliment."

"Oh, well, you know what I mean. There are three kinds of people in the world; men, women and parsons; and I like a parson who is a man first and a parson afterwards; not one who is a parson first and a man two weeks Tuesday come Michaelmas."

Donald laughed; he felt sure he was going to make friends with this shrewd, yet open-hearted, member of his flock. The pace slackened as the road began a steep ascent. Mrs. Burke let the horses walk up the hill, the slackened reins held in one hand; in the other lolled the whip, which now and then she raised, tightening her grasp upon it as if for use, on second thought dropping it to idleness again and clucking to the horse instead. It was typical of her character—the means of chastisement held handy, but in reserve, and usually displaced by other methods of suasion.

As they turned down over the brow of the hill they drove rapidly, and as the splendid landscape of rolling country, tilled fields and pasture, stretching on to distant wooded mountains, spread out before him, Maxwell exclaimed enthusiastically, drawing a deep breath of the exhilarating air:

"How beautiful it is up here! You must have a delightful climate."

"Well," she replied, "I don't know as we have much climate to speak of We have just a job lot of weather, and we take it regular—once after each meal, once before goin' to bed, and repeat if necessary before mornin'. I won't say but it's pretty good medicine at that. There'd be no show for the doctor if it wasn't fashionable to invite him in at the beginnin' and the end of things."

Jonathan, who up to this time had been silent, felt it incumbent to break into the conversation a bit, and interposed:

"I suppose you've never been up in these parts before?"

"No," Maxwell responded, "but I've always intended to come up during the season for a little hunting some time. Was there much sport last year?"

"Well, I can't say as there was, and I can't say as there wasn't. The most I recollect was that two city fellers shot a guide and another feller. But then it was a poor season last fall, anyway."

Maxwell gave the Junior Warden a quick look, but there was not a trace of a smile on his face, and Hepsey

(Continued on page 32.)

Fruits and Garden

ORCHARD EXPERIENCES.

Swiss Farmer Tells of Some Mistakes and Successes in Wisconsin.

To the Editor:—Having been raised in the fruitful valley of Lake Zurich, Switzerland, I naturally inherited a desire to grow fruit. Accordingly, when we bought our farm sixteen years ago, I decided to plant an apple orchard. To be sure, our place had always been a stock farm, but there had been a very prolific orchard on the place, which, however, through sheer neglect, had all but gone out of existence, only a few scraggy trees remaining. I was aware at the time that stock farming and orcharding combined was condemned as impractical. Nevertheless, in two years I was ready to plant the first installment of apple trees. As the state horticultural society at that time advised planting native plums, I planted some of those as well as some of the hardiest of the European kinds, which my neighbor, Mr. Wm. Toole, propagated at the time. We bought the apple trees from a neighboring nursery. I prefer this method because I can plant immediately, thereby retaining all the vitality of the trees, and also by being present at digging can make sure of getting trees true to name. Substituting has often proved disastrous. My first mistake was to take the nurseryman's advice about variety, for he naturally gave me a few trees of nearly everything he had in stock. If one is planting an orchard for home use or local market it does not matter so much, as often unmarketable varieties are the best for home use, but if one intends to grow apples for market let him make a careful list of such kinds as the market demands, considering keeping quality especially. Apples of the Wealthy type, if well grown, even though they ripen during the glut of the market, bring a fairly remunerative price, because they will stand in cold storage. We planted our trees with the good, old-fashioned spade-and-shovel method, and, really, if you are willing to apply plenty of energy and elbow grease, a good job can be done. We had the pleasure of seeing our trees start off nicely, and made a satisfactory growth during the season. We planted the ground between with hoed crops, cultivated well, and continued with that method until trees were in good bearing.

However, let me here record our second mistake. We again took the advice of the state horticultural society and set trees about twenty-four feet apart, only to find that as soon as they became of bearing age some of the trees would interlace, thereby shading one another and consequently producing much undersized and poorly colored fruit. Aside from the early summer apples, of which only a limited number should be planted, from thirty to thirty-five feet each way is not too much. Of course, we were aware of the danger of ravages by vermin, such as mice, also rabbits, and if one values his trees he may well spend a little time and money to avoid serious damage during, say, the first six years. We sometimes wrapped the trunks with burlap; sometimes I rubbed on a little axle grease, or even going through your orchard now and then and tramping the snow around the trees will save them from serious damage.

While yet a young man, during a trip through the Pacific states and during my six months' stay there, I noted the importance which fruitmen attached to proper pruning. Their trees were evenly balanced, the inside limbs scrupulously kept out, and limbs and trunks were smooth. Rough, scaly bark harbors insects and their eggs, also fungous germs. These should be dislodged from the bark by scraping, thus giving the subsequent spray a chance to do its work thoroughly. By cutting out branches where they grow too thickly, and clipping back too rank growth, we not only get rid of undesirable fruit, which never would have had the chance to fully develop, but also save the tree from certain exhaustion. Having brought the trees to bearing age, we, of course, discontinued planting crops between rows. However, we plow every year, though as shallow as we can near the trees, and drag and cultivate the fore part of the season, after which we let the weeds grow, and mow them a couple of times as they head out their seed stocks. A better way to secure this cover crop might be in sowing oats or millet or other grain or annual grass.

I must not omit to state that we have spread a light coat of stable manure throughout the orchard every year. In spraying we have followed mostly the formulas given out by different experimental stations. In the dormant season we use lime sulphur mixture (commercial) at the rate of one to eight or ten, and have been quite successful in eradicating oyster shell bark louse, tent caterpillar, aphis, etc. Later sprays we apply just before blossoms open and again when petals fall, and we spray more or less until calyx closes. For these later sprays we use lime sulphur at the rate of 1 to 35, or of Bordeaux mixture we have used the 4-5-50 rate, but are inclined to favor a little weaker mixture and put it on more copiously. We use the same spray for plums with very good results.

We have now before us the task of securing and disposing of the fruit. Much has been written on this subject lately by more experienced fruitmen than I am, but to my mind we will never be recognized in the markets as a fruit state as long as we persist in dumping inferior and even

GOOD FRUIT AND COOD CATTLE.
Showing row of twelve heavily laden Wealthies and part of Gladmont herd, J. E. Baer farm.

What's In A Name?

TWO PACKETS of seed of the same variety—equal in size and attractiveness but of unequal value to the buyer. Which do you prefer? One is readily identified by the trade mark and firm name, which assure the purchaser that he may depend on the seed being of high quality—that it has been tested for purity, germination and adaptability to climatic conditions.

The other packet is an orphan, without known connection or responsibility. It may contain seed of doubtful character and not true to name. Neither you nor any other intelligent planter would risk a crop by sowing it.

The first has the greater value because of the firm name. It is certain that we, having established a good name by over thirty years of square dealing, will not send out, under our name, seeds which are not reliable.

In buying seeds you are dependent on the knowledge, experience and honesty of the firm whose name appears on the package. It is therefore good judgment to buy

Northrup, King & Co.'s Seeds

Sold By 15,000 Dealers

In nearly every community in the Northwest there is a dealer who sells our seeds. This wide distribution makes it easy for every planter to buy NORTHRUP, KING & CO.'S tested seeds. Your dealer will take your order for any variety of our seeds you want.

32nd Annual Catalogue

This is the best book we have ever issued. It has been enlarged by the addition of many new varieties, illustrations and cultural directions. Every seed user will find it valuable, as it contains practical ideas and suggestions for garden, farm and lawn. A copy will be mailed you free, upon request.

culled fruit on the market in such quantities as has been done the past season. I am aware that some of our fruit growers do not agree with me. Nevertheless, I would say, eliminate seconds and cull down to the smallest possible per cent, or if you must grow them, keep them at home, for they will never bring any remunerative return, and by doing so you will help make a paying market for the really good fruit. J. E. Baer.

Sauk Co., Wis.

APPETIZERS FOR THE WINTER MONTHS.

To the Editor:—Many of the people living on the farm and in the small village are content to go without "green stuff" on their tables from the middle of November or the first of December until March, when with a very little trouble plenty of fresh vegetables might be had. How often the housewife sighs for a little of some fresh vegetable to break the monotony of the meal of canned vegetable and cured meat? They think that fresh vegetables are only for the people near at hand to the great forcing houses and the large cities, when a veritable garden could be maintained within their houses supplying the table with many a dish usually considered utterly impossible at that season. The house cellar or any other cellar can, if properly handled, be made to supply plenty of the highest quality rhubarb, asparagus, chicory, seakale and other greens.

How welcome in the spring is the first rhubarb pie, especially if the apple crop the preceding year has been a failure and the store of fresh fruit long been depleted? The wise man of the house will see to it that he may be supplied with this delicacy from Christmas time on until the outdoor crop is over. Ask the lover of the tender asparagus shoots and he will tell you that the season of that vegetable is entirely too short. You say canned asparagus, but the canned material cannot compare with the fresh material in any way. Yet with a little judicious use of the cellar the asparagus season can be lengthened by several months and at a time when other fresh fruits are hard to get.

In the forcing of most of these materials light is not an essential, but, in fact, quite a detriment to the production of crisp, tender stalks. The essentials for forcing rhubarb are a dark place with little or no light, a temperature of 40 to 65 degrees, although the variation may be from 40 to 80 degrees, and moisture in not too large an amount. The cellar is almost an ideal place for the combination of all of the above. It is dark and generally moist, at least the atmosphere is humid and the temperature can be kept sufficiently high with a small gasoline stove or even just a kerosene lamp if the cellar is not too large.

Take for forcing roots of rhubarb that are at least two years old and allow them to freeze; then pack them tightly in a corner of the cellar in such a manner that the product can be conveniently picked. Cover them over with a little loose, mellow earth just so that the crowns of the plants are at the surface of the ground and water them down well. It is absolutely essential that the roots have been frozen before they are brought in to force as the nature of the plant seems to demand this or else a long period before it will grow rapidly again. From now on the control of light, temperature and moisture determine the time of maturity. If the product is desired in a short time keep it quite dark and run the temperature at about 60 to 65 degrees. This will hasten the crop about a week, but the stalks are apt to be small and spindly instead of the thick, stocky stalks produced at a temperature of 40 degrees. The temperature can easily be maintained either with kerosene lamps or a small gasoline stove. J. E. Morse says that some of the finest rhubarb he had ever seen was forced in a house cellar 36x54 feet in which the only heat was that of two large kerosene lamps. If lamps are used it is a good plan to smoke the globes, as otherwise the light is usually sufficient to cause a curving of the stalks and a slight toughening of those nearest to it. In the darkness the leaf develops little or none and the stalk is formed from food stored in the root, while in the light the leaf grows at the expense of the stalk and the crop takes a long time to mature. Several waterings may be necessary if the atmosphere is not very humid. The ventilation is of very little importance. That caused by the entering of the room is sufficient to bring the plants along all right. A single root will bear from eighteen to fifty stalks ranging over a period of from four to five or more weeks. If a succession of the produce is desired it is necessary to plant some roots at a later date. In this manner rhubarb may be had from Christmas on until the outdoor crop is ready.

The forcing is very hard on the roots and they cannot be used again until they have been left to recuperate several years in the open ground. Hence it is necessary to either plant seed to secure new plants or divide the plants already present. If seed is used almost a year may be gained by planting it in August and then transplanting it the next spring. The roots are then ready to force a year from the next fall.

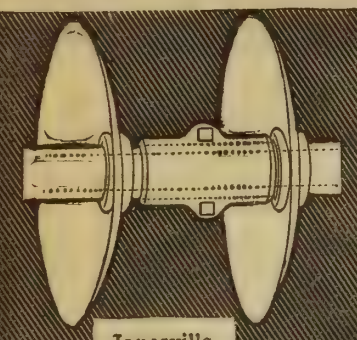
In forcing asparagus many of the same conditions are essential as for forcing except that the temperature cannot vary as much as in the case of rhubarb and still produce good, thick shoots. Pick out good three-year-old asparagus roots or older if they are available and store them, before the ground freezes, where they will not dry out. It is not essential that they be frozen, although it is conceded that freezing increases the size and the quality of the crop. In placing the roots in the cellar they are not placed like rhubarb directly on the floor, but upon a layer of four to six inches of a light soil. The roots are then packed in tightly and covered with about three inches of good mellow light soil. If the shoots are desired blanched this top covering of earth can be increased to six or eight inches. Many consider that asparagus growing is hard, but it is the easiest and most reliable plant to force that is known. In some cases it may be necessary to lay some tile drains in the bottom layer of the soil, as the crop requires plenty of water, but it should not stand in the soil. Never use cold water.

The temperature of the asparagus bed should run a trifle higher than that of the rhubarb bed, being about a constant 50 to 55 degrees. This can be accomplished by placing on tip of the bed a layer of decaying leaves that not only impart but also conserve heat. The heat for the asparagus should always be gentle and constant and never strong bottom heat, as the latter produces weak, spindly growths. The shoots usually start to grow about a week after they are set and soon the first crop is ready. The shoots of cutting size last for about two months or beginning in December last to February. Hence, with a second planting in January the season is prolonged until the outdoor season is reached. The biggest question is the keeping up of the asparagus plants for forcing. However, generally enough three-year-old plants can be set aside each year to supply all of the "grass" needed for the family.

Seakale and chicory are forced under much the same conditions as asparagus, blanching the leaves with either straw or leaves. The leaves to make a good, tender salad or green should be cut when six to eight inches high and when used at this time make a salad considered far superior to any lettuce salad. For the lover of beet greens this product can easily be produced by placing the beet bulbs gathered the previous fall in a layer of light earth and watering quite freely. Soon the leaves will grow and several cuttings of the greens can be obtained.

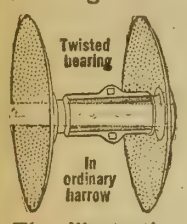
If the entire cellar is not available for forcing due to storage of fruits or vegetables, wall off a portion of it, as the pleasure of "green stuff" on the bill of fare will amply repay the work of fixing up the place. Besides the pleasure there may be some profit, as any extra material will bring a fancy price due to its being out of season.

Now, who will chide if the dinner is late due to the housewife stopping a while down cellar to gaze at the growing vegetables as the snow blows and the wind whistles outside, for the pie and asparagus on toast will only taste all the better. J. T. Raine.



"Straight-away Pull" Saves the Team

Here is a harrow that cannot bind in the disk boxes. The above shows a true position of the disk in the Janesville and Budlong harrow. As you will note, the bearings set flat against the disk boxings — the wear on the spool is equalized—oil gets to all parts—bearings last longer—the team has less of a load to pull.



The illustration above is, as accurately as we can make it, a reproduction of what takes place in the disk box on the ordinary harrow. Side strain and twisting grind down one end of the bearing. This means short life for the bearings—possibility for breakages and needless expense for you and hard work for the team.

JANESVILLE and Budlong Disk Harrow

Manufacturers of Farm Implements

Note how the disks are hung so that they enter the ground like plow points. They get a straightaway pull from the drawbar—the only resistance is the cutting of the soil.

That's why our bearings last longer. And it's easy to see that it reduces the pull on the team.

We give you your choice of steel or wood bearings. All of our bearings are interchangeable, and we will replace any of our chilled bearings proving defective within the life of the machine.

We can give you any size disk—concave—plow cut—spading or cut-out—one or two levers—with or without tongue trucks and transports.

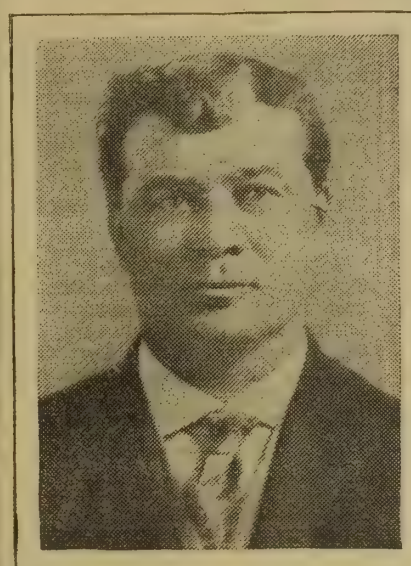
EXEMPTING PURE-BRED SIRES FROM TAXATION.

To the Editor:—I believe the state should do something more than is being done at present to encourage the use of pure-bred sires among the farmers in breeding better horses and cattle, and I am quite sure that if the registered bull and stallion could be exempt from taxation for a period of ten years it would be a great help to those who would like to own or use a pure-bred sire, and the difference in taxes to the state would be very little. It is not very encouraging to the farmer in some localities where the bull is assessed for about twice what he should be. Many farmers hesitate to buy a registered bull on that account. Many of them would buy if they could keep them without paying any taxes on them. Then I think if a man who was using a scrub bull and paying taxes on him knew that his neighbor across the way who had a pure-bred bull was paying no taxes at all, it would be some inducement for the man with the scrub to make a change and buy a pure bred. He could keep a good bull with less expense than he could a scrub. Some would say that such a law would not be right, for the man who is able to keep a pure-bred sire is more able to pay taxes on him than the man who has a scrub. Such an argument has no virtue in it for we all know that it is not the man who is the most able financially who buys the pure-bred animal, neither is it always the poor man who keeps the scrub sire, or uses the grade or scrub horse. We would not wish to do anyone any harm or injustice by having such a law passed,



R. H. POSTON, NEW RICHMOND, WIS.

but we do want to see the day of scrub sires pass away. When it does everybody will then say that the exemption law was a good one, just as they say now about the wide-tired wagon. The farmer who keeps a scrub bull ought not to oppose such a law, for it is taking nothing from him and is making it easier for him to keep a pure-bred bull. I think it is wrong for a man who is breeding high-grade cattle of any breed and keeps a pure-bred sire at the head of the herd to sell or offer for sale a grade bull, for every grade bull that goes into a herd takes the place where a pure bred ought to be. I don't consider that such work is any help to the pure-bred business.

I think that there should be a law passed soon to prohibit the use of crub stallions, not allow them to be used for public service, and that the grades should have at least five top crosses before they could stand for public service. The only thing that ought to prevent such a law from passing would be that it might cause a shortage in stallions for public service, as for grades, but the scrub stallion surely could go and not be missed.

Such laws may seem wrong to many of the stockmen, but if we expect to keep up our standing in the state and make the progress that we should they must come, and I think will come in a short time. Farmers seem to be very slow to purchase pure-bred bulls and some step should be taken to encourage the use of them. The state and government can spend a mint of money to keep men in the field talking to farmers about better stock, but the only way to make some people take notice is to touch their pocketbook, and I notice when you touch it in the way of taxes they act quickly and make a big noise. I think it would be interesting to know just how many farmers in the state are using pure-bred bulls and how many are using grades, also how many scrubs are in use.

I don't think there is any excuse for the use of a scrub sire of any kind now when you can buy a registered sire old enough for service for $100, and secure the service of a good, sound pure-bred stallion for $15 or $20. It is not because farmers can't afford better sires. It is simply because they don't know the value of good blood and better breeding. I would like to see a pure-bred campaign started for 1916. Let us get a check on the scrub bull and put him in the can, and the scrub stallion in the harness. There is where 1917 should find the last one of them.

St. Croix Co., Wis. R. H. Poston.

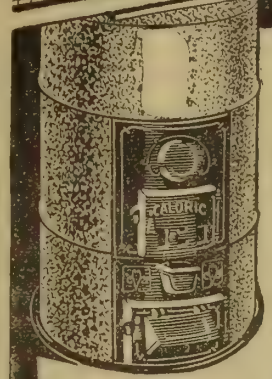
SAUK COUNTY CONFERENCE.

The fifth annual meeting of the Sauk County Country Life Association was held in the Al Ringling Theater in Baraboo January 7th and 8th. The beautiful new building was filled with interested farmers, townspeople and teachers. Topics of general interest to farm men and women were discussed. Community singing was led by Mr. Witts. Among the interesting speakers were Prof. C. J. Galpin, Prof. D. H. Otis, C. P. Norgord, commissioner of agriculture, and A. R. Hirst, state highway engineer. "Springs of Happiness," by Prof. Wm. H. Kiekhofer, was filled with humor and spirit. Miss Ethel Rodwell, a special teacher of music in rural schools, and her pupils, showed what might be accomplished in music.

A goodly number attended the banquet Friday evening. Music, toasts and goodfellowship were included in the evening's merriment. Later, community songs were sung at the theater, and a group of men dressed as farmers sang several selections pleasingly. An illustrated lecture, "Rural Life in Scotland," by Dr. A. S. Alexander, was a rare treat enjoyed by all.

Club pennants were displayed, and the talks on "What Others Are Doing," showed what each club in the country is doing.

One Register (Patented) Heats Your Entire House



(Copyright 1915 by the Monitor Stove & Range Co.)

Why pay for furnace pipes you don't need? The Caloric Pipeless Furnace makes pipes and flues unnecessary. It has just one register. Heat circulates through the entire house, giving upstairs, downstairs and halls the same degree of warmth. There is no danger of catching cold by going through rooms of varying temperature.

You save money on installation because all you have to do is put **Caloric Pipeless Furnace** in your cellar and cut a hole in the floor immediately above for the only register that is required. You do not have to cut a lot of holes in your house and spend time and money putting in pipes. Even if your house is already built you will find it easy to put in the

PIPELESS CALORIC FURNACE (TRADE MARK)

The Caloric Pipeless Furnace is guaranteed to save 35% of your fuel. This is because there are no pipes to absorb heat, and our special double ribbed firepot has 600 square inches greater heat radiation. Our single register furnace increases the heating capacity 64%. Our guarantee of 35% fuel saving is very conservative. You can pay for the Caloric Pipeless Furnace out of the money you save on fuel.

Burns Coal, Coke or Wood Economically

This is a hot air furnace and you do not have to bother keeping water in a boiler. Our firepot is guaranteed for five years. The Caloric Pipeless Furnace produces a healthful heat, because the warmed air is moist and every room and hall in the house is heated to equal temperature. It is the one furnace that will not spoil produce in your basement. It lessens fire danger, which is an important consideration, especially where there are children.

Our Strong Guarantee

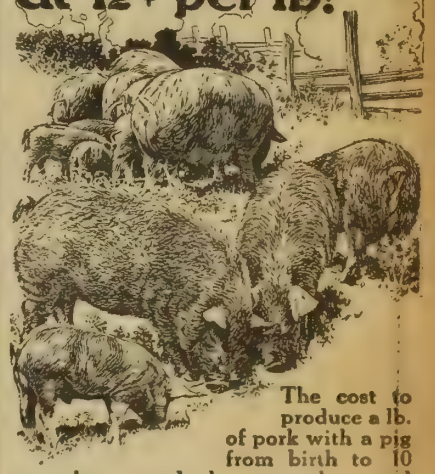
You get this furnace at our risk. We guarantee its results. We freely offer to let you put the Caloric Pipeless Furnace in your house and give it a fair test.

If quality and material are not up to our guarantee—if the Caloric Pipeless Furnace is not as represented, we will make it right at any time within a year.

FREE BOOK tells all about the Caloric Pipeless Furnace. Shows why you can heat your entire house comfortably with no pipes and only one register. The Caloric dealer in your town will gladly demonstrate this furnace. If there is no dealer, write for this free book and get details of our protective guarantee.

THE MONITOR STOVE & RANGE CO., 254 East St., CINCINNATI, OHIO

Hogs fattened at 1½¢ per lb!



The cost to produce a lb. of pork with a pig from birth to 10 months, on red clover, sorghum and peanuts and 6 3-5 bu. of corn is only 1½c per lb. along the

Cotton Belt Route in Arkansas & Texas

There isn't a section in America where you can fatten stock of any kind at less cost. This is due to the low cost of land, short mild winters, long pasture season and the great yield and variety of forage crops. Hogs run upon the mast until near Christmas and cattle require little feeding during winter months.

Walter S. Whetstone of Rector, Ark. who came from Ohio, says: "There isn't a finer place in the world for stock—plenty of feed, clover, alfalfa, etc. and very mild winters." And his stock proves it—I never saw finer hogs outside of a stock show.

Its the mild climate, and big crop yields on low priced land that makes farming of any sort so profitable in Arkansas and East Texas now? If you could talk to Mr. Burton or Mr. Barron of Blytheville, Ark. who make 60 bu. corn crops and 2 tons of clover per acre right along; or if you could visit Tilson's farm, near Texarkana, Tex. who gets $50 per acre yields of alfalfa; and then go and price the land and find it costing only half as much as equally good land up north—you'd realize what a rich opportunity there is in Arkansas and East Texas for you now. Look into this.

Two free books!

A farmer wrote them; and he knows what you want to know about a section new to you. They tell about the character and cost of lands, climate, crops raised, etc., and about schools, churches, towns, social conditions. Brimful of photograph pictures taken on the ground. Send me your name and address on a postal card today and get these free books now.

ADDING INTEREST TO SCHOOL WORK.

(Continued from page 6.)

called at her office and asked for the privilege of donating cash every year for the purpose of furthering the contest work in the rural schools. This man had no direct interest in the rural schools aside from his general interest in the welfare of the people of the county. He remarked that he had heard so much about the contest work and about the interest among the children and parents that he wished to help the thing along. He refused to permit the use of his name, but every year, about the same time, he brings in the check. Bankers and business men of the county have become interested in the contest work and have been glad to aid with the numerous harvest festivals which have been held.

There are many opportunities for good work in the rural school contests. In the first place, these contests prove to the young people that there is something to "better agriculture." The following from one of Miss McDonald's letters addressed to the members of the farm and home clubs of Oconto county will give a little insight into the interest which this notable woman takes in this work:

It is with real pleasure that we send you your club pin which you have earned this year.

The members of the club have done much good work this year. When we planned the club we wanted to have something that would bring the home and the school nearer, something that would help you to be a real helper in the home; and at the same time show you in what a good place you were living. Did your work do that? Did you enjoy helping with the seed corn at home, or keeping the milk sheet, or finding out if alfalfa would grow on your home farm? Did you enjoy making—all alone—something that you could wear, or helping with the housework? And did you enjoy the good times that you had at the club meetings, and learn that good times and work con go together?

I must tell you what the pin means, so you can explain it to others. It is the "Corn Lady's" design. The clover and the kernel of corn stand for the farm crops that will help bring prosperity; "Oconto" in the center and "Wis." on the stem stand for your county and your state, to which you must be true; the three "H.'s" mean "head," "hand" and "heart," we must educate the head, and we do that when we study our daily lessons; we must educate the hand, and we do that when we learn to sew, cook, write, test corn, tie knots, operate the tester and so on; and above all we must educate the heart, we do that when we learn to live together, at home and school, as good friends and citizens—and if we do these we shall have a happy home, which is best of all. Will your pin mean all this to you? I am sure it will. Very sincerely yours, Ellen R. McDonald.

Superintendent McDonald has, of course, had a great deal of detail work in connection with the arrangement of the contests, both for boys and girls, and the distribution of literature on various agricultural and live stock topics. She receives no additional compensation for this work which she has voluntarily placed on her own shoulders, but she enjoys it and the people of the county are very proud of her. One phase of the special school work is an effort to gather valuable information concerning farms and farming in Oconto county. This information covers a wide range of subjects. It has been tabulated as shown by the table on page 6.

BEST TEN EARS OF CORN.
Raymond Rabe, youthful corn grower of Oconto county. Ray Rabe raised 125 bushels of corn to the acre.

By the use of this table one may learn the number of farmers in every township in the county, the number of silos in every township, the number of farms where alfalfa is grown, the number of farms which have self-binders, the number of cheese factories in each township, the number of telephones on farms in each township, the number of gasoline engines, windmills, separators and oil stoves on each farm in each township. In addition, there has been devised a map of the county showing the number and location of farm and home clubs in each township.

About eighty acres of ginseng with an approximate valuation of $250,000 is under cultivation in Langlade county, which produces annually about $75,000 worth of dry roots. The major portion goes to the commission merchants of New York city and finds its market in China. Within five years the price for good roots has averaged $6 per pound.

A net gain of fifty-four bushels to the acre, which after subtracting the cost of materials, meant a probable saving of $20 for each acre, is one of the results of potato spraying trials in Langlade county. Bordeaux mixture was used by F. G. Swoboda, the county agricultural representative.

Pull Stumps 10 Days-FREE

WAUKESHA HOLSTEIN MEETING.

(Continued from page 11.)

"Specific Effects of Feed on Animal Nutrition," showing by the use of slides the effects of certain feeds in tests made at the college. His address, though technical, was intensely interesting to the man interested in getting the best results at the lowest cost in feeding and Mr. Hart pointed out the reasons for balancing rations, etc. Reproduction, he said, is the standard of the efficiency of the female, and he showed the effect of reproduction where only corn, wheat, oats, etc., were fed singly and where there was no mixture or balanced ration. Wheat fed without anything else fails, he explained, while fed with a legume or clover hay it provides a fair success with the offspring. In the investigations now under way he said that new fields are rapidly being opened up for compounding rations which results will be very interesting to the breeder and feeder.

Supt. A. J. Hutton, of the state industrial school, served as toastmaster and acquitted himself with honor. President Will, in his annual address, outlined the work of the association during the last year and predicted greater success the coming year but warned the Waukesha breeders that learned that the fundamental of the pure-bred swine game was pork, and now considers the fundamental of the dairy game to be milk. "You must not lose sight of the fact that the function of the cow is to give milk," he said, "and the cow that can give the best milk, the most milk and the cheapest milk is the best cow. That cow I consider to be the Holstein." Mr. Riordan said he found just two criticisms of the Holstein breeder. One is the breeder who thinks that his cow isn't any good if she isn't a thirty to a forty-five pounder. The other the breeder who has a fifteen pounder that is the best in his herd and because of this he considers her a world-beater.

Burt Williams, of the treasury department at Madison, spoke on the co-operation between business man, banker and farmer. He praised in glowing terms the value of the community organization, pointing out that there are now 122 of these in Wisconsin, of which fifty-one are Holstein; thirty-seven Guernsey; twenty-one Jersey; three Short-horn and the remainder general. Since 1910 he said in Waukesha the number of cows had increased almost 50 per cent and that the number of cows per farm had increased from nine to fourteen. Owing to the lateness of the hour Alfred Fuller, of North Lake, postponed his

ANOTHER VIEW OF THE WILL BARN, WAUKESHA COUNTY, WIS.

other Wisconsin counties were on the jump and that if Waukesha is to keep in the lead they must keep boosting and boosting as in the past.

J. P. Riordan, manager of Harvest farms at Maysville, a Holstein breeder, spoke very entertainingly on "The Holstein-Friesian Cow." Mr. Riordan took charge of 1,100 acres which had been run down and cropped out, and when he decided that the soil fertility must be improved he picked the Holstein to do it. He hailed her as the dairy queen, and his reason for choosing the Holstein after much investigation was that she was easily handled; gets along nicely in large groups and that, in his opinion, no other cow does better by her owner. Another big problem, especially for the large breeder, he explained, is the question of a market for the young stock, and he does not believe any cow has a broader, more reasonable market than the Holstein. The same is true with swine breeding and he related his experience when a young man as a Poland China leader. He bought the best boars available and soon found himself with a lot of pure-bred Polands in a country where there was no market. The result was he turned them to pork at the top of the market prices, and at that time he paper, "The Milwaukee Milk Market," until a future meeting.

Music was furnished during the afternoon by a quartet composed of Misses Marjorie Douglass and Marion Harter; Messrs. C. Callow and William Christoph, with Miss Nina Belle Smith as accompanist. The report of George A. Martin, of Dousman, treasurer, showed a balance in the treasury of $91.20.

Interesting Fence Facts.

CHICAGO steel fence posts are made of the same substantial material as old black wire. They are easy to install and last a lifetime without repair. They protect your crops against the insects that live and hatch in wooden posts and enable you to burn the grass clean through the fence, destroying instects completely without fence damage. Furthermore, as grounders of lightning they protect your cattle in a way wooden posts will not do. There are lots more interesting and valuable facts about fence construction which the makers of these posts would like to tell you if you will write them in reply to their advertisement on page 20. addressing Chicago Steel Post Co., Dept. J., Continental and Commercial Bank Bldg., Chicago, Ill., and mentioning this paper.—Adv.

Big Value in This Automobile.

THE KisselKar is regarded by students of the automobile and by owners who drive the car as an exceptional value, considering the price. This car is made by the Kissel Motor Company, 312 Kissel Avenue, Hartford, Wis. This company has made every effort to master the building of a perfect engine and spent considerable time on the study of engines before attempting to put out a finished automobile. All vital parts of the KisselKar are made at the Hartford, Wis., factories. The manufacturers lay special stress upon the Kissel-built axles, which have caused practically no trouble to KisselKar owners. The KisselKar is sold at $1,050. It is substantial throughout and a beautiful car in appearance. Furthermore, it provides that comfort in riding which is so much desired by motorists. The illustration of the 1916 KisselKar will be found on page 11. Catalogs describing this car in detail will be sent to any address upon request. Please mention this paper when you write.—Adv.

A Well-Tested Incubator.

QUEEN incubators have stood up under some of the most exacting tests that could be put on them and have always lived up to their reputation for big percentage returns. They are built to run with the least trouble and a maximum of hatching efficiency. In their advertisement on page 24 is a typical testimonial from one of their users. A free book about Queen incubators will be sent on request to Queen Incubator Co., 153 Bryan Ave., Lincoln, Neb. In writing please mention this paper.—Adv.

A Good Chicken Coop.

THE Lawn Park coop, which opens on the principle of a telescope and covers an area 18x48 inches and then closes for night or bad weather, is a unique protection not only for the little chicks, but for the hen as well. This is an economical, inexpensive way of handling the brood, which appeals to everyone as roomy, light, durable, sanitary. For further information, with illustrated literature, our readers should write Cyclone Manufacturing Co., Dept. 21, Urbana, Ind., and mention their advertisement on page 25.—Adv.

Heavy Mail at Hickory, N. C.

International Harvester Cream Separators Lily—Primrose

DO you realize the great interest there is in modern, profit-building dairy methods just now? At a big Farmers' Union Meeting, comprising 18 counties in North Carolina, 20 of our booklets, "Facts and Figures on Dairying," were passed through the crowd from man to man. Those desiring copies were asked to write to the Catawba Creamery, Hickory, North Carolina.

In 25 days, 462 requests for booklets were received.

Farmers are realizing that three cows with a good cream separator are as profitable as four without one. A good separator is one that gets all the cream down to one drop in each gallon of skim milk. That's efficiency—and that's the reason for the popularity of **International Harvester separators, Lily** and **Primrose.**

Lily and **Primrose separators** skim to this fine standard for years, because they are built on a sane design, strong, simple, reliable, sanitary. The few easy adjustments necessary, anyone can make. The single automatic oiling arrangement takes care of every bearing and sidesteps trouble.

"Facts and Figures on Dairying" will help you, too. Write for it and for a catalogue. See the **I H C** dealer who can furnish you with a **Lily** or a **Primrose separator.**

PLAN OF MILK PAYMENT.

[The following notes were taken from n address by J. L. Sammis before the ecent Wisconsin Cheesemakers' Con- ention at Milwaukee.]

The cheese factory should aim to ay each patron according to the yield f weight of cheese obtained from his nilk. It is well known that the yield f cheese depends to a great extent on he fat content of the milk.

It is important to understand that where the different patrons' fat tests liffer widely in the same months as rom 3 per cent to 5 per cent fat it s more difficult to figure the pay- nents correctly than when the fat ests differ less widely, as from 3.5 per ent to 4 per cent fat.

We have been collecting from many actories reports of patrons' fat tests or a number of years and from a tudy of those already received we ave found: First, no case where all he patrons at a factory had the same at test on any given month. Second, n a few cases, about 5 per cent of all, where the highest and the lowest atrons' fat test for the month dif- ered by .2 per cent fat or less. Third. n about 20 per cent of all cases the highest and lowest patrons' fat test or a single month differ by less than .5 per cent fat. Fourth, in the great majority of cases the highest and low- st patrons' fat tests differ by .5 per ent to 1.5 per cent. Fifth, in about 7 per cent of all cases the difference between the highest and lowest test s from 1.5 to 2.15 per cent.

We will now compare several dif- erent methods of figuring payments nd see which is best suited to the ive groups of factories listed above.

In order to have a standard with which to compare payments by the pooling system and other methods we will figure the true cheesemaking value of several patrons' milk based on the average yield of cheese con- taining 37 per cent moisture from milk of different fat content, as given by Van Slyke and Publow in "Science nd Practice of Cheesemaking," page 207, based on many factory reports ollected in New York state by the Geneva Experiment Station:

TABLE I. YIELD OF CHEESE FROM ILK OF DIFFERENT FAT CONTENT.

% fat n milk	Lbs. cheese per 100 lbs. milk	Lbs. cheese per lb. of fat
3.00	8.30	2.77
3.25	8.88	2.75
3.50	9.45	2.70
3.75	10.05	2.67
4.00	10.60	2.65
4.25	11.17	2.63
4.50	11.74	2.61
4.75	12.31	2.59
5.00	12.90	2.58

Using the cheese yields given above ve may calculate the payments based n yield and compare these with the ayments for the same milk by the ooling system at four factories where he range of the fat tests is .2 per ent, .5 per cent, 1.5 per cent and 2.0 per cent fat, as shown in the table No. 2, given below.

These figures indicate that the pool- ing system payments would be seri- ously in error at about 95 per cent of all factories, since only about 5 per cent of the factories are like factory No. 2 in the table and the rest are like factories Nos. 3. 4 and 5. It should also be noted that the range of tests at a given factory varies at dif- ferent times of the year and no fac- tory can be certain whether at any time it is like Nos. 2, 3 or 5 without testing the patron's milk for fat each month. These facts should be brought closely to the attention of makers and patrons at those factories, mainly for- eign cheese factories where the pool- ing system is yet being used.

Inquiries are frequently received as to the accuracy of the ordinary system of paying for milk by the Babcock test at factories where the milk tests differ widely, as in the case of fac- tories Nos. 4 and 5 in the table. It is asserted on good grounds that, for example, 6 per cent milk does not give twice the yield of cheese obtained from 3 per cent milk, but according to the usual system of figuring payments from the fat test, 6 per cent is paid for at twice the price per 100 pounds paid for 3 per cent milk.

In table 3 it will be shown that there is a slight difference between the payments figured by the usual method from the fat test and the pay- ments figured by the yield of cheese as shown in the tables above. At fac- tories where the highest and lowest patrons' milk tests for the month differ by .2 per cent or .5 per cent, or below 1.5 per cent the error in pay- ment figured as usual from the fat test is quite small and negligible in most cases. There are, however, about 7 per cent of all cases occuring at about 15 per cent of all factories where the highest and lowest patrons' milk tests differ by 1.5 to 2.15 per cent.

In these cases the difference be- tween the payments figured from the "yield" and those figured as usual from the fat test is large enough to be seriously considered and avoided if possible. Such cases are shown in the table No. 3.

From these figures it is seen that the payments figured as usual by the fat test are very close to the correct cheesemaking value of milk based on yield in all cases where, as at factories No. 2 and 3, the patrons' tests do not differ widely. But when the highest and lowest tests vary as widely as 2 per cent, as at factory No. 5, the error in payment amounts to 3 cents or more on the dollar, which is an amount large enough to be seriously considered and saved, if it can be done so, without too much trouble. This matter is of interest to about 15 per cent of all factories and a method of figuring payments from the fat test, so as to avoid this error, will be presented in table No. 4.

The price per 100 pounds given in the last line is the price to be paid for 100 pounds of such milk only as had the same test as the "average test" given in the fifth line of the table. That is, at factory No. 1 the price paid for all milk testing 3.1 per cent fat is 1.2995 per 100 pounds and similarly the "average price" is paid at each factory for milk of the "aver- age test." For milk testing higher than the "average test" the price may be increased 1, 2, 3, 3½ or 4 cents per .1 per cent fat above the "average test" and for those whose milk tests less than the "average test" the price per 100 pounds will be similarly re- duced. The question is, should the price be raised 1, 2, 3½ or 4 cents per .1 per cent fat in order to make all patrons' payments agree as nearly as possible with the payments figured in table No. 2, according to the "yield" based on the table of yields given in table No. 1. The payments figured by

TABLE 2. PAYMENTS BASED ON YIELD COMPARED WITH POOLING SYSTEM PAYMENTS.

	Factory No. 2	No. 3	No. 4	No. 5
A Highest patron's fat test	3.2%	3.5%	4.5%	5.0%
B Lowest patron's fat test	3.0%	3.0%	3.0%	3.0%
Yield from 100 lbs. A milk (in lbs.)	8.76	9.45	11.74	12.90
Yield from 100 lbs. B milk (in lbs.)	8.30	8.30	8.30	8.30
Total yield (lbs.)	17.06	17.75	20.04	21.20
Net amount due patrons at 15c	$2.559	$2.6625	$3.006	$3.18
A's payment at 15c per lb. yield	$1.314	$1.4175	$1.761	$1.935

Before Filling Your Silo Again

Learn why a small gas engine is all that is necessary to operate the "Papec" Cutter successfully; how you can fill your own silo and have more silage, of greater food value. Better silage and a **full** silo—because the corn was cut when ready and settled from day to day.

PAPEC PNEUMATIC **Ensilage Cutter**

The "Papec" system throws the silage 15 to 20 feet—then a powerful blast strikes it and carries it to the top of any silo. **Six** fans, instead of the usual **four,** increase the blowing power—at a low speed of the cutting and fan wheel. They move the ensilage in a steady even flow; therefore only a small pipe is necessary.

YOUR ENGINE WILL RUN IT—

Even if only 4 to 8 H. P. Thousands of "Papecs" everywhere are being successfully operated by gas engines of no more power. The low speed—600 R. P. M.—the Papec cutting and fan system—the small pipe—all mean a saving of power, more durability and perfect satisfaction.

The Papec is Simple and Built to Last

The solid one piece semi-steel frame removes the necessity of bothersome bolts, screws or warping wood. The few parts are all easy to get at. Cutting mechanism can't get out of adjustment. Blades adjusted in a minute, always stay set. No chains. Driven by heavy gears. The small, convenient pipe is all there is to set up or take down.

PAPEC MACHINE CO.,
Box 71 Shortsville, N. Y.

Send Postal for Free 1916 Papec Book

Tells what you should know about ensilage cutters; how, why and where the Papec is superior. Shows and describes new patented self-feeding device for hay and small growths. It also handles corn successfully.

Your Cows Yield as they Feel

Poor milkers are not accidents—they are usually backward because there is something wrong with their physical condition. You cannot expect such a cow to give a good milk yield until her sluggish organs have received proper medical treatment.

Kow-Kure has become the standard remedy in thousands of dairies because this famous cow medicine has great medicinal qualities that work upon and tone up the digestive and genital organs, making each perform its proper function.

You can prove for yourself the merit of Kow-Kure by trying a package on one of your poor milkers, and watch results carefully. Besides being a general tonic, Kow-Kure is especially recommended for the prevention or cure of such diseases as Abortion, Barrenness, Milk Fever, Scouring, Lost Appetite, Bunches, Retained Afterbirth, etc.

Raised Without Milk!

Her name is "Daisy" and her owner, W. A. Riddle, of Chapin, Iowa, raised her on Blatchford's Calf Meal, which costs less than half as much as milk.

Blatchford's Calf Meal

A useful preventive of scouring. Calves raised "The Blatchford's Way" are heavier, bigger-boned and healthier. Known as the complete milk substitute since the year 1875. Sold by your dealer or direct from the manufacturer.

Blatchford's Pig Meal insures rapid, sturdy growth of young pigs at weaning time. Prevents setback.

See Actual Figures —based on results—that show you how to increase your calf profits. Write today.

Blatchford Calf Meal Factory, Dept. 63 Waukegan Illinois

these different prices are shown in the table No. 5 for comparison.

Comparing the "yield" payments at the top of table No. 5 with the others below it can be seen that at factory No. 2 the payments are all reasonably close, whether we allow 1, 2, 3 or 4 cents per .1 per cent fat, which signifies that there is no need of using this method of figuring at factories like No. 2, where the highest and lowest patrons' fat test are so close together as .2 per cent.

At factory No. 3 the payments figured at 3 and 3½ cents per .1 per cent fat above the average are quite close to the "yield" payments. At factories Nos. 4 and 5, where there is some real need of using this method of figuring in order to get correct payments, the payments at 3½ cents per .1 per cent fat above the average are much nearer the "yield" payments than any others.

It may, therefore, be concluded that when this method of figuring payments is employed in the cheese factory the work is done as follows:

1. Figure from the fat tests and weights of milk, the total weight of fat delivered. Divide this weight of fat by the total weight of milk to get the average fat content of all the milk.

2. Divide the total money to be distributed by the total weight of milk which gives the "average price" which is to be paid to those patrons, whose milk tests the same as the "average test" obtained in (1).

3. To determine the price per 100 pounds milk for each patron whose test is higher than the "average test" substract the "average test" from his test and for each .1% fat left, add 3½ cents to the "average price" obtained in (2). Similarly deduct for patrons whose milk tests less than the average. for example, if the "average test" is 3.67% and a patron's test is 4.10%, the difference is .43% fat, and 4.3 times 3½ cents or 15.05 cents should be added to the "average price" to get the price to be paid this patron.

4. Finally mutiply each patron's weight of milk delivered by his price per 100 pounds figured as above, to get the amount of money due him.

As long as a factory's highest and lowest milk tests in one month do not differ by more than 1.5 per cent the usual fat test method should be used. If the tests differ by 1.5 to 2.25 per cent the method of figuring shown in tables Nos. 4 and 5 may be used, if desired, although this requires somewhat more work with the pencil than the usual fat test method.

TABLE 3. PAYMENTS BY YIELD, COMPARED WITH THE USUAL FAT TEST PAYMENTS.

Factory	No. 2	No. 3	No. 4	No. 5
A Highest patron's fat test	3.2%	3.5%	4.5%	5.0%
B Lowest patron's fat test	3.0%	3.0%	3.0%	3.0%
Yield from 100 lbs. A milk (in lbs.)	8.76	9.45	11.74	12.90
Yield from 100 lbs. B milk (in lbs.)	8.30	8.30	8.30	8.30
Total yield	17.06	17.75	20.04	21.20
Net amount due patrons at 15c	$2.559	$2.6625	$3.006	$3.18

More on Poultry Problems.

Continuing a Series of Letters From Prominent Poultry Breeders and Farmers of Wisconsin Giving Their Practical Experiences.

Make Hens Work for Their Food.

To the Editor:—I prepare all my hens and pullets for the winter laying. I give all my layers the first day some stale wheat bread soaked in hot milk or water, then mix enough bran to make it crumbly, then add one coffee cupful of molasses. Mix well, and let them eat as much as they want. This mixture is for three to four loaves of wheat bread. The second day, in the morning, give them scalded wheat, or barley, or corn. Let it stand in the hot water until it is cool enough to feed, then give one handful of feed for each chicken. For instance, if you have twenty chickens in the pen give them twenty handfuls of the scalded food in their trough. In the afternoon give half that amount of good, dry, whole grain for each hen. That same evening you soak in cold water the amount of feed you need for the next day. Let it stand until the next morning, then drain and feed. This third day should be oats and add a little salt, for it is an appetizer. In the afternoon give the same feed. Have plenty of good, sharp grit and oyster shell before them in their hoppers, for this feed will loosen them up and all half-round and smooth stones will leave them and they will fill up on the good, sharp grit and oyster shell. From now on give grain in deep litter every morning and make them work for their food. Every day between eleven and two let them eat a dry mash composed of one-half bran, one-quarter corn, one-quarter middlings, with one pound of beef scrap to eight pounds of the above mixture, let them eat for three hours, then take away or close up. In the evening give a little warm corn. Always warm their grain. It will help to keep them warm. Also give them warm water. If you have a lot of cabbage give them some every day. I also feed sprouted oats and barley, which is very good to keep them toned up. Try to pet your chickens as much as possible, for that helps to make them lay.

The open front is the thing for small-combed varieties where the winters are not too severe. Extreme open front is responsible for many frosted combs and wattles. Chickens do not need much warmth, but may be greatly injured by exposure to extreme cold. If you always keep your hens comfortable you will get the eggs. Here is the correct front for this climate and all the different breeds I have experimented with; Barred Plymouth Rocks, White Plymouth Rocks, Rhode Island Reds, and Single Comb White Leghorns, which is one of the best fine-combed varieties. I put in half of my windows with muslin front, which will keep out the moisture trouble, caused by condensing on the roof at night and dripping on the floor in the day, which is a great cause of disease. That there is a limit to this experiment no one will deny, but it has not yet been reached, and every step so far has been a benefit to the poultry and greater profit for the industry. Birds that have been kept in open front houses can stand a much lower temperature than those accustomed to warmer quarters. Combs and wattles are more liable to be frosted in the early morning than at any other time, and in extremely cold weather it may be worth while to darken the house and keep the fowls quiet until the sun is up.

I keep my yards and poultry houses free from lice and mites by the following method: Every fall and spring clean houses and whitewash. Spray with a good lice liquid and also fumigate your coop if possible, for it is a good prevention. Take some sulphur cake or powdered sulphur, put in a pan and set this pan in a dish of water, for the fumes and the water form an acid effect which is very strong. Remove fowls from coop while smoking. Keep coop closed five to six hours, then open windows and doors for a good ventilation. I always take out my roosts and scrub them with a good lice solution and soak the dropping boards. If the chickens are full of lice and you want to get rid of them quickly make a lice salve yourself by putting one pound of lard into a kettle and heating until thin, then add one tablespoonful of kerosene and one teaspoonful of lice liquid. Mix well, then let it cool until you can hold your finger in it. Grease your fowl on the head, under the wings and down the middle of the back, to prevent the lice and mites from traveling around the fowl, and grease the vent, for this is headquarters, or the reunion place, for lice and mites.

As to roup, I've had my troubles years ago and started to make my own roup cure. I made a study of this dreaded disease and found that prevention is the best. A chicken's head is all glands that lead all over, and it is always a gland that it caught cold in that will cause the swelling and form pus or a hard canker that can be worked out through the nostrils or into the roof of the mouth or the corners of the eyes by soaking the head in a warm solution of roup tonic. Always keep your water fountains clean by pouring scalding water into them. Keep your yards dug up and put lime on the ground, which will help to sweeten it up again. Also prevent crowding, which is very bad for your flock. Some poultrymen say the ax is the best remedy for roup. In severe cases it is, but not in mild cases while we have such good roup cures on the market now.

Concerning the sale of stale eggs; all the stores out here have the electric candling machine and candle all eggs brought in by the farmers. The storekeepers say that is one of the best investments they have, for it cured the farmers of bringing in bad eggs. The farmers ought to candle the eggs themselves by taking a candler, or take the eggs and hold their hands over them so as to half shadow them against a lamp light, and they can pick out all eggs that have started to hatch. A lot of farmers find hidden nests full of eggs and pack them in the crate, then take them to the store and let the storekeeper tell them the eggs are rotten and he doesn't want them. They could avoid this by candling the eggs before trying to sell

Birds taken to Milwaukee by F. H. Thiele. Mr. F. H. Thiele at the left, his son, Robert, at right. Little Francis C. Thiele is seen petting her first-prize pullet. A family all interested in better poultry.

them. The good, clean, uniform eggs always bring a penny or two more than the market price. Also be sure not to send any eggs that have stains on them to hotel men, for they can't serve them soft-boiled with the shell. Keep these and the cripples yourself.

Fred H. Thiele.

Milwaukee Co., Wis.

From a Buff Wyandotte Breeder.

To the Editor:—I can talk chickens a good deal better than I can write about them, but will give my experience during the last ten years as a breeder of Buff Wyandottes. With me the chickens are a side issue—something to fool with when I get through work, and, as it does not cost any more to raise good ones, and they look better than scrubs, I try to keep mine up to the standard and I think I have succeeded.

To my way of thinking three things are necessary for egg production during the winter months, namely: good stock, proper feeding and comfortable houses.

In regard to stock I find that early hatched pullets or year-old hens that have got through the molting period in good season make the best winter layers.

I feed all grain in litter about one foot deep. The litter consists of oak leaves and straw. Grain consists of wheat, oats, barley and cracked corn, brought in the house the night before so that the chill will be off it when fed in the morning. At night, and sometimes at noon, feed a mash consisting of boiled oats mixed with bran-feed (corn and oats) ground, and middlings, moistened just enough to make it crumbly. I feed sprouted oats also and find it one of the best kinds of green feed. At night give them a good feed of whole corn that has been warmed. Keep plenty of warm water before them, also grit and oyster shell and dry bran in hoppers. Hang cabbages up about two feet from the floor so that they will have to jump for them. When I can get fresh green bone I feed about one ounce to each hen about twice a week, sometimes in the mash and again just throw it in the litter.

We have very good success with our style of house. It is eight by twelve, six feet high in front, five feet in rear, divided into two compartments, one used for roosting and the other for laying. It has good, large windows facing the south, and a scratching shed at each end eight feet wide by sixteen feet long, partly enclosed with windows and partly open, with burlap over the openings. Scratching material is always dry. We do not close the door of the roosting house except on stormy or very cold weather, and it is always dry.

I have not been bothered with mites since I started keeping poultry. Have kept the house and roosts clean and have used kerosene on the roosts. Have had trouble with lice up to last spring when I saw an advertisement of an ointment that should be used on the chickens in the spring and again in the fall. I got a tube of it and used it on my stock and there is no more dusting for me. I used it last spring and have looked a number of times for lice and did not find them until a week ago, when I got busy again and greased all of them.

Have had only one case of roup and used a well-known roup cure. As the case was not a very bad one, I was soon out of trouble on that line. I keep the yards clean and spade them up several times during the summer and always plant something in part of them, and I always keep the houses clean and dry.

We have been pretty lucky in regard to the sale of decayed eggs in this locality and have not heard of any action along this line. The only time people are bothered is when they get cold storage eggs at the store.

Frank J. Blood.

Portage Co., Wis.

Clean Up Poultry House.

To the Editor:—Clean up your poultry house. Get an old broom and clean off the walls, get the cobwebs down, particularly between the rafters, where there are usually many of them. Clean up the floors, remove the curtains and the roosts and give it a new coat of whitewash. The poultry house should be whitewashed twice a year, spring and fall.

I have an open-front house and the birds do better in the winter, for I have had the experience of a closed house with the frost on the ceiling. I have put in a ventilator from the bottom and a muslin front and a curtain in front of the roosts, and the air is more pure and clean.

I have my poultry on a city lot fenced in, raise a little corn to give them plenty of shade during the hot summer months, and the runways are always plowed up and turned over about six inches deep, which keeps off the germs and parasites. Look over both outside and inside and see that there are no cracks. Cover them up so that there is no draft on the birds at night.

For the feeding I put in about six inches of litter, throw in the feed and let them go after it. I feed cracked corn, wheat and oats, mostly, and dry mash in a hopper all the time. Give them fresh water daily.

When you get stock and eggs get the best, and you will not make a mistake by doing so. Last year I bought some Langshan eggs, paid $10 for twenty eggs, got eighteen chicks and they all did fine. Sent a cockerel to the big Coliseum Show at Chicago and took first and champion ribbons. A. R. C. Black Minorca cockerel also took first, winning over breeders that have bred birds for thirty years. That's going some. Now keep your poultry house clean and watch the results.

O. C. Steingraeber.

Jefferson Co., Wis

FEEDING POULTRY FOR BREEDING PURPOSES.

Observations made in connection with the work of the Maine station, as well as a study of the literature which exists upon the subject, have led to the opinion that in order to get the best results in respect to the fertility and hatching quality of eggs it is not desirable to feed birds which are to be used as breeders the heavy laying ration which is used to force egg production during the winter months in pullets. The feeding of such rich food has a tendency, it is believed, to reduce or impair the fertility and hatching quality of the eggs. Therefore, a plan of feeding birds kept to be used as breeders has been devised with the idea of getting over this difficulty so far as possible. This method of feeding is used for old hens, cockerels and cock birds which are kept from one season to another for breeding. The aim is to keep these birds on as light a ration as is consistent with the maintenance of good condition until just before the beginning of the breeding season when they are to be used and then to put them on a more stimulating and richer ration. The scratch food given to this breeding stock is the same as that given to the pullets, namely, corn for the first morning feed and a mixture of wheat and oats for the second feed of the day, both scattered in the litter. If, however, there is any tendency for the yearling hens kept as breeders to get unduly fat during the winter, corn is not fed as a litter grain. The hens, under such circumstances, are simply given the mixture of wheat and oats at both feedings.

The dry mash used for these birds kept as breeders has the following composition: Bran, 400 pounds; corn meal, fifty pounds; daisy flour or other low-grade flour, fifty pounds; meat scrap, 100 pounds.

Birds kept over from one season to another are managed in the following way: The birds completing their pullet year which are to be kept as breeders are continued on the usual pullet ration until after they have finished their molt in the early fall, usually in September or early October with the birds here. Immediately after the molt is over and the hens are well feathered out they are put on the dry mash ration given above. They are fed in the way described until the beginning of their second breeding season. The breeding pens are usually mated up about the first of February. During the breeding season all birds, both hens and pullets, are fed the following mash: Wheat bran, 200 pounds; corn meal, 100 pounds; daisy flour, 100 pounds; gluten feed, 100 pounds.

It will be noted that this contains no meat scrap or other animal food. The experience of the Maine station indicates that by reducing animal food to a minimum or dropping it altogether it is possible to improve markedly the hatching qualities of the eggs. Besides the dry mash the breeders are fed wheat, corn and oats in the same way as the laying pullets. Further, they are given an abundance of green food, always including green sprouted oats.

RENTERS HAVE POOR POULTRY QUARTERS.

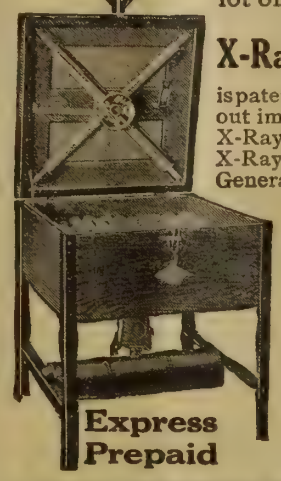
To the Editor:—Last spring I wrote you my experience with common fowls. This year, 1916, is our third year on a rented farm and in this part of the country there are no accommodations for poultry keeping at all. I suppose other renters find the same trouble, but it makes it hard for the woman of the house. By the time the little chicks begin to hatch there are so many other things to do.

I have sold enough of my culls and

One Gallon Oil—One Filling

THE X-RAY INCUBATOR CO. DES MOINES IOWA U.S.A.

X-Ray Does the Work



IF you are using any incubator with a lamp on the end or side you are paying big oil bills. If you are using any incubator whose tank has to be filled more than once to the hatch you are doing a lot of extra work and taking a big chance on the eggs becoming chilled. If you are using an X-Ray Incubator you're saving four to five gallons of oil and—what may be more important—you're saving a lot of work and worry—most important of all, you're getting the *biggest hatches*.

X-Ray Central Heating Plant

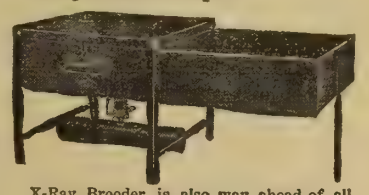
is patented but its huge success has brought out imitations. Don't be deceived. The X-Ray know-how cannot be imitated. The X-Ray Duplex Heating Plant and the X-Ray Generator are exclusive X-Ray features which account for X-Ray supremacy. You ought to have an X-Ray. It's built on the right principles throughout. Insures biggest hatches, sturdiest chicks and least trouble.

Express Prepaid

Ask for X-Ray 1916 Book

It tells all about X-Ray Fifteen Big Special Features. Learn all about X-Ray egg tray, perfectly level, no sag, makes turning the eggs the pleasure of a minute; X-Ray automatic trip, saves fuel, keeps the temperature in the egg chamber exactly right, automatically regulates the heat. Works itself—cuts down flame if heat exceeds the need—lets on more flame if temperature drops.

Learn all about the X-Ray hinged glass top and all the other X-Ray Special Features.



X-Ray Brooder is also way ahead of all others. Lamp beneath, same as in X-Ray Incubator, saves the chicks—that means profit.

old hens to more than pay my summer feed bill, and the eggs have kept up the table, so that sales from stock and grain could be applied to other things. I kept account of the fried chickens until they numbered up in twenty, then I lost count. It is surprising how many young chickens a small family will eat and they are a healthful meat. My little boy was delicate and ate very little until after fried chicken time came, then he ate all he wanted and began to mend. Now he is as fat as a butter ball. I do not believe there is any meat as healthy for children as chicken, either fried, boiled or baked. We seldom give the poultry department credit for the saving in the meat bill.

Poultry keeping is a painstaking labor no matter what one feeds and when one has not the means to carry on the work properly it is surprising what one can do with poultry with old, rattle-trap roosting houses, no mating lots, no coops nor old scraps to make them of. These are some of the conditions under which I have made a success with poultry. I feed whole corn, dry bran, Irish potatoes and beets driven to the wall by a nail, cabbage fed in a hanging basket made of a scrap of poultry wire. The potato, beet and cabbage I feed raw when snow is on or bad, windy days when the weather is severe. I also give them sweet or sour milk. I keep grit, oyster shell and charcoal before them all the time, and I have this winter discovered that a pan of cracked nuts, either walnuts, butter nuts or hickory nuts, whatever one has on hand, will take the place of insects they find in summer.

We really belong in the Hoosier state. I have bought a place of sixty acres and we hope to go home this coming fall. I expect to sell all my dear old biddies, together with what I raise this summer, and invest the money in new stock. I have had good success with the common barnyard variety. Now, will someone help me decide what breed to get? I have thought of the White Leghorn, but they have two faults. The hawks see a white chicken at a greater distance than any other color. Then, too, the buttons, as the merchants call them, appear on the leg so young that if for any reason you cannot market them at the right time you do not get any price for young roosters. Yet I like them for eggs. I have had a few Brown Leghorns in my mixed flock and they seem to be easier to take disease than any of the other chickens. Will someone else give their experience along this line? I am not afraid to start with any breed, but I would like to start right with the right breed with my limited means, as what I make from my chickens will have to help build their new home, and beginning wrong will put me back a great deal, so will someone help me to decide what breed to choose and just how to begin?

I will be eight miles from a fairly good market about thirty-nine miles from the capital. The interurban runs every hour from the town of about 10,000. Although I will be a Hoosier, I will still be one of your big family of readers, so you see a new start means a great deal to me.

Poultry Lover.

POULTRY MONEY ENOUGH FOR FOOD AND CLOTHES.

To the Editor:—In my estimation, poultry raising is an occupation suited to both old and young. It has done much for me. It has, to a great extent, been the means of supporting my home in that it has supplied the table with meat and eggs, besides buying the groceries and much of the clothing for a family of six. Last year I raised 150 chicks and did not use an incubator. I had the best luck with the chicks, as I lost but a few, and these were killed by the mother hen. I seldom lose a chick after it is hatched.

The pullets from last year's hatch I kept and many of those that were hatched in the months of February and March have been laying since the middle of September. The cockerels that were hatched in these months were sold when weighing two pounds,

RHODE ISLAND REDS bred by Mrs. F. H. Burke, Brodhead, Wis., whose advertisment appears on this page.

for which I received 23 cents per pound. Those hatched later in the season were kept to supply the table.

I raise the Barred Rocks and I think they are the best breed that I can get for an all-purpose farm fowl. They have proved to be good layers and grow to a size that makes them a desirable table fowl as well as for selling on the market.

My henhouse is not an expensive one, being built of rough lumber. The front faces the east in order to let in all the sunshine possible. My brood coops are made portable so that they can be removed from platforms beneath and frequently cleaned. I think I owe much of my success in raising poultry to keeping everything in connection with the poultry house and brood coops dry and sanitary. My poultry have free range, which I think is another advantage in chicken raising. When selecting eggs for hatching I select those obtained from the best layers of my flock and make the nests of the sitters warm and comfortable, the latter being especially important when setting hens early in the season. I gather the eggs from the nests soon after they are laid in order to prevent them from chilling when the weather is cold. I never put more than fifteen eggs under each hen early in the season and I never have any trouble in securing a good hatch. The chicks are kept growing from the very start by good feeding and housing.

I never feed young chicks for a day and night after hatching, and their first feed is scant—just a few dry bread crumbs—increasing the amount after the first few days. I give them plenty of clean water from the beginning. When the chicks are two weeks old I begin feeding chopped corn and wheat three or four times daily and push them on as fast as possible to maturity.

I consider the main reason of my "good luck" in chicken raising is owing to the fact that I was raised on a farm and love to work among chickens. I would advise every woman or girl going into the chicken business to get the best breed possible to begin with. My beginning with the Barred Rocks was with only one setting of eggs, which cost me $1.50, and at the present time my flock numbers 100 pullets and hens, besides eight cockerels. This spring my intention is to purchase an incubator, my idea being to set several hens at the same time and divide the chicks among the hens and allow them to do the brooding, as I think this would be less trouble than operating a brooder.

Mrs. Rosie Lowery.

Johnson Co., Illinois.

Recently more than seventy teachers of rural schools in Dane county and about 100 teachers in Wood county asked to have their names placed on the regular mailing list to receive bulletins from the agricultural experiment station. These bulletins will be used in teaching agriculture as carried on under Wisconsin conditions.

A report from the Wisconsin Department of Agriculture shows about 50 per cent of seed corn for 1916 in sight Seed corn will be high in price in the spring and the man who has good matured seed of Wisconsin varieties will be well off indeed.

Wisconsin Wins In Big Hatching Contests Every Year

Why Pay More

For only $10 you can get these two prize winning machines, delivered, freight paid east of the Rockies. You take no risk—money back if not satisfied. You can order direct from this ad. Ask the publisher about us.

Both Machines Freight Paid For Only $10

We also furnish 180 Egg Incubator and 180 Chick Brooder both for only..$12

Wisconsin Incubators have long proved their wonderful hatching qualities. Competing with every make known, they won in the five big annual National Hatching Contests. Think of it. Five consecutive victories. That certainly proves you can't make a mistake. Shipped on **30 Days' FREE Trial**

MONEY BACK IF NOT SATISFIED

10-YEAR GUARANTEE

Wisconsins have hot water heat, double walls, double glass doors, copper tanks and boilers, self-regulating. Nursery under egg tray. Made of finest, select, clear CALIFORNIA REDWOOD, not pine, paper or other flimsy material. Incubator finished in natural color—not painted to cover up cheap, shoddy material. Incubator and Brooder shipped complete with thermometers, egg tester, lamps, everything but the oil. This is the best outfit you can buy. If you don't find it satisfactory after 30 days' trial, send it back. Don't buy until you get our new 1916 catalog, fully describing this prize winning outfit. WRITE FOR IT TODAY. You can't make a mistake in buying a Wisconsin. On the market 15 years.

WISCONSIN INCUBATOR COMPANY, Box 102 Racine, Wis.

Live Well On Chicken Profits

You can do it when you go about it the Johnson way. Let me send you this poultry book and show you how we started 650,000 others. It's no trick to live off the chickens and save the profits you make in other lines. You can let the chicken profits pay the bills—live on the fat of the land and still have money to put in the bank or put into improvements around your home. Get in touch with us and we will show you the way.

Old Trusty

Makes big hatches winter or summer for the beginner as well as the oldtimer. Now used by 650,000 poultry raisers, which is three or four times more than the next best can show. That's because Old Trusty owners go in for profits and get them. You take no risks the Johnson way. Old Trusty comes on forty to ninety days' trial and ten-year guarantee. Also we pay freight. Write today for Old Trusty book and low price based on 100,000 sales this year.

Still Less Than $10.00

Freight Paid to any point East of Rockies—a trifle more to points beyond.

CHOICE BOURBON RED TURKEY TOMS, $4.00; hens, $3.00. Address Herman Ihde, Neenah, Wisconsin.

FARM MECHANICS

Auto, Farm Engine and Farm Machinery Ailments diagnosed and remedies suggested in this department

QUESTIONS AND ANSWERS.

Medical Battery for Light.

I have a small shocking machine. Could I arrange it so as to run an electric light?

Answer.—It would not be practical to run an electric light with your machine.

Lining Worn.

I have a 1915 Model T Ford car. When starting in low it grabs with a jerk, killing the engine at times. I have tightened the slow speed band, and given the set screws in the clutch fingers one turn each, but without improving it. Can you suggest a remedy?

Answer.—The lining of the low-speed band is worn. Remove the old lining and put in a new one.

Firing Order.

I would like to have you explain the firing order of six and eight cylinder motors. Is there an explosion every one-third or every one-sixth of a revolution in a six-cylinder motor? Is the explosion every one-fourth or one-eighth of a revolution in an eight-cylinder motor?

Answer.—The firing order depends upon the design of the crankshaft, not all motors having the same firing order. The firing order of any motor is easily found by turning the motor slowly and noting the order in which the intake valves open, the order of valve opening being the same as the firing order. The firing order is usually stamped on the crank case of the motor. Six cylinder motors have an explosion every one-third revolution, eight-cylinder motors every one-fourth revolution.

A Motor Sled.

I am intending to make a motor sled. At what speed should a four or six-foot propellor be run to move sled weighing 400 pounds at a moderate rate of speed? What horse power would be required? What wood is best for the propeller?

Answer.—Make the propeller out of maple. It is best to use boards one-fourth of an inch thick glued together so that the grain does not match. This prevents splitting. Make the hub strong and heavy and the tips of the blades very light. The speed of the tips of the blades should not exceed a mile a minute. For a five-foot propeller this speed requires about 350 revolutions per minute for the propeller shaft. Five horse power would be required. A sled of this kind would not be a success excepting on ice or on a level road.

Fan for Vacuum Cleaner.

What is the difference between a suction fan and a blower fan? Could I make a vacuum cleaner from a fan without putting a cover around the fan by fastening fan blades to the side of a solid wheel and mounting the wheel near a board having a three-inch hole in it; running three-inch spouting up the side of the house to the various rooms? How fast should the fan run and how much power would it take? Would it sweep flies off the screen door?

Answer.—You would not have any success unless you enclose the fan. Fans for blowing and suction are made the same, the difference being in the housing. The suction pipe is connected at the center of the fan housing, the blower pipe at the rim. You might cut an opening in a small box, the fan fitting the opening, and the suction spout running from the box. For a three-inch pipe we would suggest a fan about twenty inches in diameter running at a speed of 1,000 R. P. M. The fan must be well made and well balanced. About three horse power might be required. It would probably be better for you to purchase a fan from your hardware dealer.

The use of a vacuum cleaner to remove flies from screen doors is a novel idea and might work out well, especially after dark, when the flies are not easily disturbed. The vacuum cleaner is coming into general use and it may help solve the fly problem.

Registering a Car.

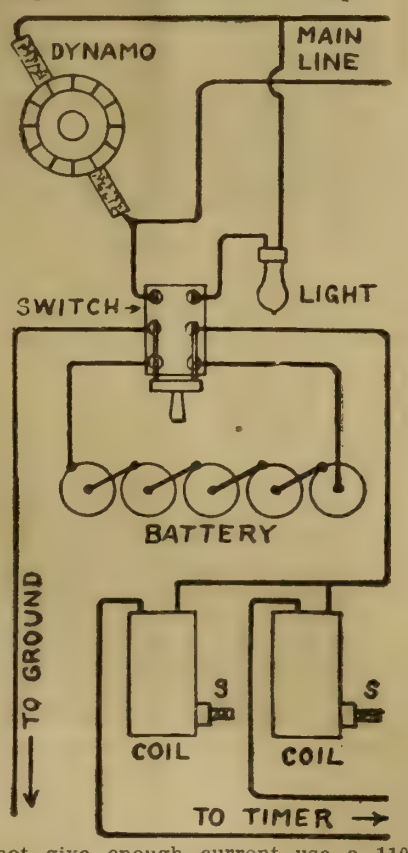
What are the registration laws of Minnesota, and what is the usual fee? When an Iowa man moves to Minnesota, taking his car along, is it necessary to notify the secretary of state of Iowa?

Answer.—When a man having an automobile moves from one state to another he does not have to notify the secretary of state of the state from which he moves. He should, however, write at once to the secretary of state of the state into which he has moved for information as to the license laws of that state and he should proceed to comply with those laws as soon as possible. The fee usually depends upon the S. A. E. horse power rating of the motor.

Ignition From Generator.

I have a 110 volt, five-ampere generator that I use for lighting. I would like to know how it can be connected to my gas engine to furnish ignition current. Can it be connected to the same vibrators, or is the current too strong?

Answer.—The current is too strong to connect direct, but it may be connected as shown in the figure, using a lamp for resistance. If a sixteen-candle-power 110-volt carbon lamp does not give enough current use a 110-volt lamp of greater candle power. When the switch is in the position shown the engine may be started on battery. Closing the switch in the upper position cuts out the battery and closes the circuit from the generator to the engine.



Some Power Saw Questions.

I have some questions to ask about my twenty-six-inch wood saw. I have a five-horse-power gas engine the speed of which is 425 R. P. M. The engine has a friction clutch pulley twelve inches in diameter. The pulley on the saw shaft is six inches in diameter, six inches wide. I also have a 200-pound balance wheel which is thirty-four inches in diameter. I wish to mount this wheel under the saw shaft, driving the balance wheel shaft pulley by a short belt from a pulley on the saw shaft. What size pulleys shall I use? Will a canvas belt three and one-half inches wide do the work? What is the speed of a twenty-six-inch saw when running as above stated? If a twenty-eight-inch pulley were used on the engine and a twelve-inch pulley on the saw shaft, would the engine's power on the saw be increased or decreased? The saw maker does not advise a speed of over 1,000 R. P. M. for a twenty-six-inch saw.

Answer.—With your twelve-inch to six-inch pulleys, your saw makes about 800 R. P. M. The saw would make a little over 1,000 R. P. M. with the twenty-eight to twelve combination. The actual power remains the same, but the higher the speed the less the pulling power of the saw at the rim. In the first case use an eight-inch pulley on the balance wheel shaft, and a six-inch pulley on the saw shaft. In the second case use a ten-inch pulley on the balance wheel shaft and a six-inch pulley on the saw shaft. The wheel and shaft must be well balanced to prevent vibration. The three and one-half-inch belt is rather light. A five-inch belt would be better.

Timing a Motorcycle Engine.

I would like to know how to time a twin-cylinder Indian motorcycle engine, Model 1913, equipped with Bosch magneto.

Answer.—Time the rear cylinder only, the front cylinder will be correct if the rear cylinder is correct. Set the exhaust valve so that it closes on top dead center or slightly afterward. The intake valve should open at the instant the exhaust valve closes. Having set the valves, turn the engine until the piston in the rear cylinder is at the top center of the compression stroke. Then turn the motor backward until the piston has moved down one-fourth of an inch. Set the timing lever at maximum advance. Turn the armature so that the points of the circuit breaker are just about to open and tighten the magneto coupling in this position. If after connecting the magneto with the spark plugs only one cylinder fires give the armature one-half a turn without moving the other parts.

Ask your neighbor to subscribe for The Wisconsin Farmer.

ENGINE POWER COSTS LESS NOW

LET me send you an engine to earn its own cost while you pay for it. **Easy to start; no cranking;** easy to understand and manage; and easy to pay for on any suitable, reasonable terms of payment, during a year. I have helped many thousands to own engines in this way, during my 29 years of engine building.

FARMING IN VILAS COUNTY.

One of the Last of the Wisconsin Counties to Receive Attention, Vilas Is Coming Rapidly to the Front—County Agent System Is Bringing Excellent Results.

GREAT things will some day be heard, in an agricultural and dairying way, from Vilas county, Wisconsin. There were days when men looked upon this section as beautifully wooded and dotted with lakes and thought what an ideal hunting preserve it would make. But the agricultural and dairy lands of Wisconsin became scarcer and higher in price and the farmers marched northward step by step as the lumbermen finished their work. Those who have used good common horse sense in farming, and who have been willing to work hard for a few years and put up with some privations and lack of conveniences, are just at the point when they are coming into success. Like other Upper Wisconsin counties, Vilas has been tried and proved O. K. for farming. Its grass and grain crops are large, though the acreage is yet small. But the opportunity has been proved and it is now only a question of getting good, honest hard-working settlers to stick by the job through thick and thin until they have a fine farm cleared, the land in grasses or crops, farm improvements and money in the bank. It isn't a picnic to make good in Vilas county. But it is just as sure as death and taxes to those who will go at the work with the right spirit and determination. The views shown on this page indicate something of the progress which has been made "up north." County Agricultural Representative Oscar Gunderson has been on the job, helping the settlers to make good. Wisconsin people who not many years ago did not think seriously of Vilas county as a farming proposition must now admit that she is on the map; and the county representative system has had a big part in putting her there.

Mr. F. I. Carpenter, of Chicago, who is the owner of considerable land in Vilas county, Wisconsin, has made a special study of soils and crop conditions in that section. He is considering the matter of starting a model dairy farm in Vilas county. In a recent letter he recalls some of the incidents of his numerous inspection trips across the county and his conferences with farmers. Mr. Carpenter says the time has now come when Vilas county must look to agricultural development as the solution of its future greatness. This same opinion was recently expressed by Mr. C. I. Cook, of Menominee, Mich., who was for years an Iowa farmer. Mr. Cook is now managing several farms near Menominee in connection with his canning and wholesale grocery business. Like Mr. Carpenter, he is quite familiar with the land situation in Vilas county.

Both of these gentlemen write that they expect Vilas county to be a dairy and cattle-raising section. They look for continued increases in clover and hay throughout the county as the land is cleared up, and they agree that the silo is bound to be an important farm adjunct. Root crops, clover and alfalfa, however, will be the mainstay of Vilas county, and these will be the big aids to profitable dairying.

Mr. Carpenter writes that in Herefordshire, England, ten tons of root crops per acre are raised for cattle feed, and he says such a record is not unreasonable to expect in Vilas county, Wisconsin. He also believes that one of the best crops for feeding purposes is sugar beets. He says the beets are worth $10 a ton for feeding, and this is $4 a ton more than they are worth for sugar. A rotation of root crops, clover and some good silage crop is suggested by Mr. Carpenter, and he says when this rotation is put into effect one may expect as good profits in Vilas county as on fertile lands anywhere. One thing which will increase the profits in Vilas county is the fact that the original investment is small. Mr. Carpenter expressed the opinion that alfalfa will soon be quite as prominent as clover throughout Vilas county, and, in fact, in the sections of Upper Wisconsin which are commonly spoken of as the "clover belt."

In the matter of dairy farming under Vilas county conditions, writes Mr. Carpenter, the smaller or moderate units often have a better chance of profit-making than larger enterprises. We have had many notable examples of large and expensive herds which have suffered from the costs of inbreeding and tuberculosis and which have, for some reason or other, seemed to be the worst victims of foot-and-mouth disease and other cattle troubles. Many of these instances lead to the belief that close confinement under feed-saving methods often results in waste of health. Fresh air, sunshine and cleanliness are great and effective preventives.

Blooded bulls are necessary to the

THE CHILDREN'S PRAYER.

The suggestion that our readers send us the prayers they have taught their children has met with a generous response and we have received quite a number of very pretty ones, indeed, from among which we think the friend who appealed to us will be able to make a selection.

One reader of our columns, B. F. Chamberlin, says:

I know of no better prayer for little children than the old one our mothers taught us. It is so simple and short that most children can grasp its meaning.

The first recollection I have of my mother is when, after preparing me for bed, she read a chapter from the Bible and then had me kneel down and, with her hand on my head, taught me to say:

Now I lay me down to sleep,
I pray the Lord my soul to keep.
If I should die before I wake,
I pray the Lord my soul to take.

That is one of the sweetest memories of my life. I am now quite an old man and it is now and has always been very fresh in my mind.

Some have objected to this little praper on the grounds that the little child should know nothing of death and should be taught nothing of death. But what could be sweeter than the memories that it brings to Mr. Chamberlin? Surely the repeating of those four lines at his mother's knee meant much to him and the reference to death only inspired a faith in his Maker and a feeling of security in His love, rather than a dread of the Grim Reaper.

Mrs. M. H. McComb sends us both morning and evening prayers and also two forms of Thanks for the child. Any one of them, we think, would appeal to the child through both rhythm and thought. Mrs. McComb says she has taught all three of her little daughters the following:

EVENING PRAYER.

Now I lay me down to rest,
Angels guard my little nest.
Like the wee bird in the tree,
Loving Father, care for me,
Glad and well may I awake,
This I ask for Jesus' sake.

MORNING PRAYER OR SONG.

Father, we thank Thee for the night
And for the pleasant morning light,
For health and food and loving care
And all that makes the day so fair.
Help us to do the things we should,
To be to others kind and good
In all we think or do or say,
To love Thee better every day.

CHILD'S THANKS.

Father, we thank Thee for our food,
'Tis by Thy hand we all are fed.
As each new day our wants return,
Give us, O Lord, our daily bread.

ANOTHER FORM OF THANKS.

Lord, we thank Thee for this food,
Bless it to our every good.
True love for all may each one feel
As we eat this {morning / noonday / evening} meal.

Mrs. McComb says that her little girls also enjoy repeating the Lord's Prayer and the Twenty-third Psalm. The writer remembers that as a very little child the Twenty-third Psalm had more appeal for her than any prayer or any other quotation.

Still another friend, Mrs. C. C. Taylor, says:

Seeing your request for prayers for children in The Home, I want to suggest that as a mother I taught my children very simply to divide their prayers into four parts, which can be done thus. First, confession—just name some wrong that may have been done and ask forgiveness; thanksgiving—something for themselves to remember either for home, parents or friends; intercession—always to pray for some companion or sick one; lastly, supplication—in their own words to ask for something both for their soul, as to overcome some habit, and for temporal wants. Or they repeat the Lord's Prayer, we down on our knees with them.

The following, which we quote from John Martin's Book, seems to us very nearly ideal for the little child. It is sweet and simple and full of loving thought and confident faith:

Dear God, another day is past,
Another night has come at last.
Your watchful, tender love will keep
Me safely guarded while I sleep.
The quiet night is soft and kind.
The world below, the sky above
Hold only restful, healing love.
I have not thoughts nor things to fear,
When God and so much love are near,
The dreams that come are sure to be
God's nighttime messages to me.
I'll sleep and rest the whole night long
So I may grow both big and strong.
God bless and keep my dear ones; then
Bless everybody else. Amen.

A HOBBY THE HOUSEWIFE'S SAFETY VALVE.

There are none to dispute the fact that housework is "powerfully constant," but, according to Miss Nellie E. Maxwell, of the department of farmers' institutes of the University of Wisconsin, there is no need of becoming a slave to it.

Do not imagine yourself under life sentence to the broom and dish cloth, for often the most exacting and perfect housekeeper is the poorest homemaker, and homemaking is, or should be, every woman's business. All work and no play will have its dulling effect on Jill just as it does on Jack and happy is the housemother who can leave things undone to run and play for a few hours, bringing her needed rest and change.

There are many women like the farmer's wife in a late story who had wanted for years to see the sun rise from a hill back of her home, but there was always breakfast to get at that time.

The pleasant thing about having a hobby or fad is that it need not be expensive and we don't all like the same things nor want to do the same kind of things. There are any number of hobbies to fit any taste and many a woman has saved her mind as well as good looks by having a hobby.

The person who is well informed on some one certain thing is always interesting and we are always glad to meet him if he doesn't ride the hobby too long or too often. Someone has said that "an educated person is one who knows something about everything and everything about something."

What more charming hobby could there be than a rose garden or a wild flower garden like that of a dear old friend who loved the wild flowers and transplanted every kind she could find in the woods in a small corner of her garden. Every spring she had the delight of watching day by day the delicate early blossoms which she had loved in the woods.

Bird study is a perfectly fascinating hobby and a good one in which to include and interest the children. They love nature and will learn to listen for, and return, the bird calls. One woman gained a new lease on life by keeping bees and studying the habits of the entertaining little workers. Another hunts the woods and meadows for mushrooms and is an authority on the edible varieties. Nowadays nobody is a really good companion who is not informed on the common plants, birds and flowers, their names and habits.

A diffident person may, by being full of her subject, become a charming conversationalist, when she can forget herself in the thing she loves.

Even the collecting of old teapots and cream pitchers may keep one young and interesting, as was proven by a charming old lady who had several cabinets full of pots of which she knew the history and which she loved like children.

The study of moths, butterflies and beetles afford interest to those whose tastes are so inclined. The making of rose beads, the study of basketry bead work, crochet patterns and kindred handiwork may afford keen delight to the work-weary wife.

Having a hobby need not make one narrow and selfish. It should, on the contrary, have a broadening effect and even the male members of the family enjoy the riding of a hobby.

TO KEEP SAUSAGE.

To the Editor:—Here is a suggestion that has proven helpful to me and I would like to pass it on to others.

Instead of frying sausage and packing for summer use I learned of an easier way. Make your fresh sausage (which has been ground and seasoned with salt, pepper and sage) into small cakes, as for frying, and place in layers in a new stone jar. Set this in a moderately hot oven and bake about thirty minutes, or until the top sausage seems well cooked. If the lard does not rise sufficiently to cover add enough fresh, hot lard so the top layer will be one-half inch below the surface.

After well cooled tie a flour sack and paper over the top and keep in a cool place for summer use.

Never use an old or cracked jar, for fear of poisons forming. One-gallon jars are best. Mrs. H. A. M.

SCOTCH LIVER PUDDING.

To the Editor:—I am sending you a recipe for making Scotch liver pudding, which I think is very nice.

First, boil beef or hog liver until tender. Then take three cups of liver, one cup of onion, one cup of corn meal, one cup of lard. Cut onion fine, mix all together, season with salt and pepper. Put it in a sack (a small salt sack will do) and cook in a kettle of water until done. Then take it out, let it get cold and peel out of the cloth.

Anna Hastie.

NEVER FAILED WITH SOAP.

To the Editor:—In answer to Mrs. H. L. in regard to making good hard soap out of hog skins, cracklings, etc., so there will be no settlings at the bottom of the kettle I will send you my recipe.

For the scraps, skins, cracklings, etc., of one hog take one can of lye and dissolve it in enough water to about cover the scraps. Boil from one to three hours, stirring occasionally. Then pour in enough water to cover any bones or pieces that the lye has not eaten up and set kettle in a cool place so the grease will rise to the top and harden. Then carefully take the grease all off with a spoon, leaving the settlings undisturbed.

Now weigh your grease and for every five and a half pounds of grease take one can of lye. Empty the contents of the can of lye into a stone jar or iron vessel, with two and a half pints of cold water. Stir until lye dissolves, set aside until temperature by your thermometer is not over 80 degrees. Melt the five and a half pounds of grease until it dissolves. When melted set aside until temperature is 120 degrees. Now slowly pour dissolved lye into the grease, stir until lye and grease are thoroughly combined and drops from stirrer like honey. Stir slowly, but not too long or you may separate the lye. From five to fifteen minutes is enough, according to grease and weather.

Pour into mold (a wooden box will do), cover with blanket or carpet, set in a warm place for a day or two, empty out and cut as desired.

If you have no thermometer you ought to be able to tell by putting your hand into the grease, as it should be considerably warmer than the temperature of the body and the lye not quite so warm. I have never used a thermometer and never had a failure.

Mrs. J. M. G.

SOAP RECIPE FROM A NEW FRIEND.

To the Editor:—I am just a brand new subscriber, but I saw Mrs. H. L.'s letter asking for a good recipe for soap making. Now I have one that has never failed and if the rules are followed closely it will be exactly what Mrs. H. L. and the others want.

Take sixteen pounds of meat scraps, three cans of lye, three gallons of cold water. Dissolve one can of lye in each gallon of water. Put the meat scraps in and put all into a large iron kettle on the stove. Let boil steadily for two

You Cannot Beat Kalamazoo Quality

300,000 satisfied customers say there are no better heating stoves and ranges made than Kalamazoos—yet you save $5, $10, $15 to $40. Why not take a Kalamazoo on trial? Now is the time—get a quality range at a money saving price. Send today for catalog.

hours, stirring so not to boil over. Take off and let stand until the next day. Cut out the top and throw away the bottom. Dissolve one more can of lye in one gallon of water and add to the top you cut out and let boil one hour after striking the boiling point. Pour into convenient vessels for cutting out into cakes.

I hope this will be of benefit to someone. I am just a newcomer to your paper, but hope to be of help anyway as we all need help once in a while. Mrs. C. E. P.

LIKES TO READ LETTERS FROM OTHERS.

To the Editor:—I have never written a letter to your department, but I always turn to your page as soon as I receive the paper.

I am a farmer's wife and have received many good suggestions from the letters of different people. We have no living children, but I like to read the letters from different mothers who have fresh-air babies and I enjoy seeing their pictures.

I see that some of the ladies are having grief with their soap. I made my soap this fall from grease which I rendered from hog's hide. To about one gallon and a half of grease I added two quarts of water and one can of lye. I stirred this mixture thoroughly, then placed it over a medium fire and allowed it to boil till it threaded from the spoon with which I stirred it every few minutes.

It can be poured into a square mold, if desired, or left in the cooking vessel till hard, when it will turn out readily.

I hope this will aid some of the soap makers. An Interested Reader.

CANDY AND PICKLES NOT GOOD FOR CHILDREN.

To the Editor:—I have been reading the letters in the Home Department concerning the care of babies.

I have a real healthy baby girl aged one year and six months. She has never had a sick spell in her life except a slight cold. I will send you her picture. Hazel June is her name.

I believe in having plenty of fresh air in the sleeping room and I also believe one should be careful in what they feed their babies. I do not believe in letting small children have candies or pickles or anything that is hard to digest.

I am interested very much in the letters concerning the care of babies and hope to hear from some more mothers who have healthy babies.

Mrs. D. Sedrel.

HELPFUL HINTS.

Cut clean newspapers into pieces of convenient size—about seven by ten inches—and hang on a hook handy to the kitchen sink. Use them to wipe grease from dishes and pans before washing. The greasy papers are easily dropped into the stove and burned and the dish water is kept much cleaner and free from grease.

If a cake will not come out of a tin easily place the tin on a cloth wrung out of hot water for a few minutes and it will come out readily without sticking. If the tin is greased with lard instead of butter and sprinkled with flour before putting the cake in there will be little chance of sticking.

To make a loaf cake bake evenly on top spread the batter a little higher on the sides than in the center of the pan. When done the cake will be even and smooth instead of being higher in the center, as is the case when the batter is spread evenly when put into the oven.

An emergency bag is a very convenient addition to the medicine closet; it should be made of two strips of heavy linen or denim, about six or seven inches deep, the back piece to be made about eighteen inches long and the front twenty-seven inches; the two strips should be bound together at the ends and across the bottom, then stitched to form several pockets (eight or nine), a flap should be buttoned over the top and each pocket labeled with indelible ink. One pocket should contain rolls of bandages, another bits of old, soft linen, another lint from worn-out napkins; other pockets should be made to hold bottles of arnica, witch hazel, carbolic acid, Jamaica ginger, absorbent cotton, a box of healing salve, a piece of castile soap and one-half dozen fingers cut from old, large kid gloves.

Layer cake requires a hotter oven than loaf cake.

A tiny funnel hung up by the ring and painted to match the kitchen woodwork is a convenient twine holder. The ball of twine just fits in the bowl and the end of string hangs down through the spout. The edge of the spout may be filed sharp and used as a twine cutter.

The measuring cup should hold one-half pint.

To make a shirtwaist box get a strong store box four feet long, three feet wide and three feet high. Pad with cotton wadding, on the inside, line with muslin or whatever material is desired and cover outside with either denim or matting. Use upholstery tacks along the edges. Put casters on and fasten the lid on with nice, strong hinges after the upholstering has been done.

Eggs thoroughly cooled are much more easily beaten.

Cleanse your combs and brushes often in very hot water and a little ammonia. Plunge into cold water immediately, shake well and dry in the sun. Keep ivory or polished wooden handles out of the mixture. Do not use this on air-cushioned brushes, as the ammonia rots the rubber.

RECIPES.

Apple Loaf.—Reserve enough bread dough to make a small loaf. Work thoroughly into it one tablespoonful of butter, one-third cup of sugar, one-fourth teaspoonful of cinnamon and two well-beaten eggs. Add flour to make a soft dough, knead lightly and let rise. Divide into three equal parts and roll each part to fit the pan. Lay one piece in a buttered pan, spread over it an inch layer of sour apples chopped fine. Pour over the apples a tablespoonful of melted butter, cover with the second piece of dough, and continue as before. Brush the top with milk, and let rise until very light. Steam for one hour, then place in a hot oven to brown lightly. Serve in slices with sugar and cream.

Apple and Cabbage Salad.—Shave cabbage fine and soak for one hour in celery water, made by adding one teaspoonful of celery salt to each quart of water. Drain and dry on a soft cloth. Add an equal amount of apple cut in small pieces. Mix with boiled dressing.

Cheese Puffs.—Four tablespoonfuls flour, two tablespoonfuls butter, two tablespoonfuls grated cheese, one cup water, two eggs, one-fourth teaspoonful salt, a little cayenne pepper. Put water and butter over the fire. Mix all dry ingredients thoroughly and turn these all at once into the boiling liquid. Stir quickly and cook, stirring all the time, until a smooth, stiff paste is formed and slips from the saucepan while stirring. When cold, add the unbeaten eggs one at a time and mix very smooth and velvety. Drop on a greased pan a little distance apart, using a generous teaspoonful for each puff. Bake in a moderate oven until they are light and puff up.

Virginia Waffles.—Boil half a cup of Indian meal in a cup and a half of boiling water thirty minutes. Add a cup and a half of milk, two teaspoons each of sugar and melted butter, two cups of flour, two heaping teaspoons of

SNIPPY GETS A GOOD HOME.

Dear Young Folks:—One evening when my sister and I were coming home from school we stopped at a house to get a drink and the lady who lived there had five little puppies and she gave us one.

We were a mile and a half from home and we carried him in our book sack. Mamma came to meet us and we showed her our puppy. She told us we had to take it back, but the next morning we acted like we forgot it—but we didn't.

That afternoon when we got home we took some sacks and made him a bed outside, for mamma would not let us put him in the house. When papa came home from work that evening we got our puppy and showed it to him. He said it was a fine dog and we were pleased. We fed him some sour milk and put him to bed.

The next day was the day we named our puppy and mamma helped us find a name. We thought once we would name him Rover, but finally called him Snippy. He learned his name in a week and when we called him he would come running to us.

When we moved Snippy came along. He seemed proud of his new home. We left our cats up at the other place. Snippy grew every day and his hair became curly. One day mamma went up to the place that we moved from and she brought back one of the kittens, the one we called Snowball. She is white and that is why we called her Snowball.

We were glad to have mamma bring Snowball, but Snowball was lonesome and had no other cats to be with so she took up with Snippy. At night Snowball would sleep with Snippy. One morning I found Snippy and Snowball on the porch fighting. I watched them a minute and then I made them quit. In a little while I saw Snowball loving Snippy and when Snippy would bite her she would slap him. We never got the other cats so Snippy and Snowball stayed friends.

Snippy has black eyes, yellow ears, white feet and yellow legs. He looks like he has leggings on. His hair is long and curly and his nose is long. He is a pretty puppy.

Snowball has three brown feet, a gray tail, a gray nose and ears and the rest is white. She looks as though she would melt if you were to touch her, her fur is so fluffy, and she keeps very clean and white.

Snippy will jump up and he looks so cute. We have another old dog and when he snaps and growls Snippy will run away and whine, for he is afraid of the other dog. He meets us when we come home from school and jumps and plays, for he is glad to see us. —Lucile.

A TRIP TO CALIFORNIA.

Dear Young Folks:—I have been reading your letters so long, but this is the first time I have ever written.

When I was five years old I went to California with my grandmother and grandfather. I had a fine trip. We went the northern route and saw some beautiful sights. They took me to Long Beach and I picked up little shells. When we were going through the Needles we saw about fifty Indians. They were selling beads and other things they had made. I bought one string of beads and still have them. We saw prairie dogs and coyotes and many other things.

—Mildred.

A FAITHFUL DOG.

Dear Young Folks:—One day my little cousin, Nellie, was playing in the garden when she saw a big yellow butterfly and she tried to catch it. It flew from bush to bush, she always following it. The butterfly flew into the woods and Nellie followed it.

There were many beautiful flowers in the woods and Nellie forgot about the butterfly and began picking flowers. She picked as many as she could carry and then wanted to go home. But she did not know which way to go. Everywhere were large trees and beautiful flowers. Nellie walked until she was tired, so she sat down under a tree and soon fell asleep.

Bellow, Nellie's dog, followed her and soon found her. He ran home and scratched at the door. Nellie's mother opened the door and let him in. He pulled at her dress and would not let it go. She thought there must be something the matter with Nellie, so she went with him and they soon reached the place where Nellie was sleeping. Her mother woke her and Nellie was very glad and told her mother about the butterfly. They went home and told Nellie's father about it. They thought Bellow was a very good dog. —Erna.

LITTLE TIMBER SQUIRRELS.

Dear Young Folks:—I am nine years old. I live on a farm and am going to tell you about our squirrels. There are a great many trees where I live and the squirrels think they are in the woods. They get in our corncrib every day, too, and when we are not looking they steal corn. There is an ear of corn in almost every tree.

We never shoot the squirrels. We put up a box for them and put corn in it. They will come and eat out of the box and when they get all they want they stand up on their hind legs and chatter as though they were thanking us for it. —Mamie.

HAS SIX HEALTHY, HAPPY BABIES.

To the Editor:—As I have a very healthy family I will send my baby's picture. Harold Duane, aged six months, has light hair and blue eyes and weighs twenty-five pounds.

He has had plenty of fresh air and sunshine and has never been fed anything but mother's milk and a drink of water every day.

I hope to hear from some more mothers who have fresh-air babies. I am the mother of six children, all well and happy. Mrs. John Manely.

HAROLD DUANE MANELY.

International Sunday School Lesson

Lesson for January 23, 1916
(By E. O. SELLERS, Acting Director of Sunday School Course.)

THE SPIRIT OF LIFE.

LESSON TEXT—Romans 8:12-30.

GOLDEN TEXT—As many as are led by the spirit of God, these are the sons of God.—Rom. 8:14.

The connection of this lesson with the others of the series is in the fact that this chapter is a panegyric regarding the spirit-filled life, the coming of which we have so recently studied. Read prayerfully in this connection Gal. 5:22, 26. We somehow feel that we ought to study this entire chapter rather than that portion assigned. The key to the whole is found in verse thirty-seven, "We are more than conquerors." If conquerors, how be more than conquerors? Very simple. Some victories leave the victor so exhausted that he cannot possess nor enjoy his victory; not so the spirit-filled Christian, for he is "more than conqueror."

Previously in this epistle the spirit is mentioned but once (5:5); in this chapter he is mentioned nineteen times. Over what is the spirit-filled man conqueror?

I. Over the Condemnation of Sin, v. 1. The spirit-filled Christian lives in another realm than that of the flesh (v. 9). The spirit removes us from the realm to that of the spirit, quickening us (i. e., making us alive who were dead in sins) to condemn sin in the flesh and enabling us to "walk not after the flesh, but after the spirit."

II. Conquerors Over the Power and Dominion of Sin, vv. 2-4. While we still have the body, yet it is our privilege, through the spirit's power at work within us, to put to death its deeds every day and each minute (Gal. 5:16, 22, 23). To live otherwise is to displease God (v. 8). Those who surrender their lives to the control of the indwelling spirit are "sons of God and, therefore, "free from the law of sin and death (v. 2), for the same spirit that "raised from the dead" (v. 11) not alone makes us sons but gives us the same power.

III. Conquerors Over Fear, v. 15. The righteousness of the law is fulfilled in us "who walk not after the flesh but after the spirit" (v. 4) and having received the "spirit of adoption" (i. e., being placed as sons) we cringe not before God in terror, nor call him a tyrant, or even ruler, but exclaim "Abba, my father." As "sons" we are spiritually minded and have "life and peace" (v. 6, Gal. 4:6).

IV. Conquerors Over Suffering, v. 18. We are joint heirs with Jesus "if so be we suffer with him." Our position and heirship in Christ involves our participation in his sufferings (Gal. 6:17, II Tim. 2:11, 12, Acts 14:22). What we often call afflictions are only discomforts and frequently the results of our own foolish carelessness. But as contrasted with his glory there is no comparison. Only eternity will enable us to comprehend what it means to be made perfect through suffering (Phil. 3:10, II Tim. 2:12, Heb. 5:8). If we are heirs of all God has and all that God is we are likewise an heir just as Christ is, and

to the extent that Christ is an heir and hence to his sufferings (we suffer with him) though we are even there more than conquerors, for like him we, too, shall rise triumphant "over all things."

V. Conquerors Over Vanity, v. 20. This glory is contrasted with the creation now subject to vanity, but which is in degradation by comparison. The creature (v. 21) (i. e. creation) was made subject not willingly, but by reason of him who subjected it in hope that the creation should yet be delivered from the bondage to the principles of death and decay into the glorious liberty, or the liberty of the glory, of the children of God.

VI. Conquerors Over Infirmities, v. 26. The believer's all-sufficiency and perfect security in the Lord Jesus. We may not have all we want, yet we have all we need (Phil. 4:19). This sufficiency is the privilege we possess in praying "according to the will of God"—we know not how to pray as we ought, but the spirit maketh intercession for us (v. 26); so also Christ, "who is at the right hand of God," intercedes for us (v. 34). The spirit knows the mind of God the father, teaches us how to pray and at times places a yearning in our hearts too deep for our own comprehension.

Even God must search the heart to know the mind of the spirit (v. 27) and in this God does "exceeding abundantly above all that we ask or think" (Eph. 3:20).

VII. Conquerors Over All Things, v. 28. The crowning privilege the spirit-filled life has is in knowing that all things work together for good and hence we are free from all possible anxiety of heart under any and all circumstances. Whatever comes to me is a part of his "all things" and, therefore, I should be grateful because the outcome will be good. We are not fore-ordained to salvation irrespective of what we may be or do, but we are fore-ordained as believers "to be conformed to the image of his Son" (v. 29). Thus those who become candidates are those elected.

HEPSEY BURKE.

(Continued from page 16.)

chuckled. Keeping her eyes on the horses as they trotted along at a smart pace over a road none too smooth for comfortable riding, she remarked casually:

"I suppose the Bishop told you what we wanted in the shape of a parson, didn't he?"

"Well, he hinted a few things."

"Yes; we're awful modest, like most country parishes that don't pay their rector more than enough to get his collars laundered. We want a man who can preach like the Archbishop of Canterbury, and call on everybody twice a week and know just when anyone is sick without bein' told a word about it. He's got to be an awful good mixer, to draw the young people like a porous plaster, and fill the pews. He must have lots of sociables and fairs and things to take the place of religion; and he must dress well and live like a gentleman on the salary of a book agent. But if he brings city ways along with him and makes us feel like hayseeds he won't be popular."

"That's a rather large contract!" Maxwell replied with a smile.

"Yes, but think what we're goin' to pay you, six hundred dollars a year, and you'll have to raise most of it yourself, just for the fun of it."

At this point the Junior Warden interrupted:

"Now, Hepsey, what's the use of upsettin' the young man at the start. He's——'

"Never mind, Jonathan. I'm tellin' the truth, anyway. You see," she continued, "most people think piety's at a low ebb unless we're gettin' up some kind of a holy show all the time, to bring the people together that wouldn't meet anywhere else if they saw each other first. Then when they've bought a chance on a pieced bed-quilt, or paid for chicken pie at a church supper, they go home feelin' real religious, believin' that if there's any obligation between them and heaven, it isn't on their side, anyway. Do you think you're goin' to fill the bill, Mr. Maxwell?"

"Well, I don't know," said Maxwell. "Of course, I might find myself possessed of talent for inventing new and original entertainments each week, but I'm afraid that you're a bit pessimistic, Mrs. Burke, aren't you?"

"No, I'm not. There's a mighty fine side to life in a country parish sometimes, where the right sort of a man is in charge. The people take him as one of their family, you know, and borrow eggs of his wife as easy as of their next door neighbor. But the young reverends expect too much of a country parish and break their hearts sometimes because they can't make us tough old critters all over while you wait. Poor things! I'm sorry for the average country parson, and a lot sorrier for his wife."

"Well, don't you worry about me; I'm well and strong and equal to anything, I imagine. I don't believe in taking life too seriously; it's bad for the nerves and digestion. It will be an entirely new experience for me, and I'm sure I shall find the people interesting."

"Yes, but what if they aren't your kind? I suppose you might find hippopotamuses interestin' for a while, but that's no reason you should like to live with 'em. Anyway, don't mind what people say. They ain't got nothin' to think, so they make up by talkin' about it, especially when it happens to be a new parson. We've been havin' odds and ends of parsons from the remnant counter now for six months or more; and that's enough to kill any parish. I believe that if the angel Gabriel should preach for us half the congregation would object to the cut of his wings, and the other half to the fit of his halo. We call for all virtues of heaven and expect to get 'em for seven-forty-nine."

"Well—I shall have to look to you and the Wardens to help me out," he said. "You must help me run things, until I know the ropes."

"Oh! Bascom will run things for you if you let him do the runnin'," she replied, cracking her whip. "You'll need to get popular first with him and his—then you'll have it easy."

Maxwell pondered these local words of wisdom and recalled the Bishop's warning that Bascom, the Senior Warden, had not made life easy for his predecessors, and his superior's exhortation to firmness and tact, to the end that he, Maxwell, should hold his own, while taking his Senior Warden along with him. The Senior Warden was evidently a power in the land.

They had driven about a mile and a half when the wagon turned off the road, and drew up by a house standing some distance back from it. Getting down, Mrs. Burke exclaimed:

"Welcome to Thunder Cliff, Mr. Maxwell. Thunder Cliff's the name of the place, you know. All the summer visitors in Durford have names for their houses, so I thought I'd call my place Thunder Cliff, just to be in style."

Jonathan Jackson, who had kept a discreet silence during Hepsey's pointers concerning his colleague, the Senior Warden, interjected:

"There ain't no cliff, Hepsey, and you know it. I always tell her, Mr. Maxwell, 'taint appropriate a bit."

"Jonathan, you ain't no Englishman, and there's no use pretendin' that you are. Some day when I have a couple of hours to myself I'll explain the whole matter to you. There isn't any cliff, and the house wants paintin' and looks like thunder. Isn't that reason enough to go on with? Now, Mr. Maxwell, you come in and make yourself perfectly at home."

(To be continued.)

Don't Wear a Truss

BROOKS' APPLIANCE, the modern scientific invention, the wonderful new discovery that relieves rupture will be sent on trial. No obnoxious springs or pads. Has automatic Air Cushions. Binds and draws the broken parts together as you would a broken limb. No salves. No lies. Durable, cheap. **Sent on trial to prove it.** Protected by U. S. patents. OUR FASHION DEPARTMENT

ALL PATTERNS, 10 Cents Each.

THIS department is prepared especially for The Wisconsin Farmer. We can supply our readers with high-grade, perfect-fitting, seam-allowing patterns at 10 cents each, postage prepaid. Full directions for making, as well as the amount of material required, accompany each pattern. When ordering, all you have to do is to write your name and address plainly, tell us the correct number and size of each pattern you want and inclose 10 cents for each number. We agree to fill all orders promptly and guarantee safe delivery. Address all orders to The Wisconsin Farmer, Madison, Wis.

7560 Ladies' Shirt Waist.—Cut in sizes 34 to 44 inches bust measure. This pretty waist has a square collar and three tucks at each side of the front. Long or short sleeves may be used. The girdle may be used or omitted. Collar, cuffs and girdle are of contrasting material.

7542 Ladies' Skirt.—Cut in sizes 22 to 30 inches waist measure. Serge, broadcloth or gabardine can be used to make this skirt. The skirt is cut in two gores and is perfectly plain. There is a small belt at the waistline in the back.

7280 Ladies' Shirt Waist.—Cut in sizes 34 to 48 inches bust measure. This waist has tucks running the full length of the center of both front and back. The fronts are also tucked at the shoulders and the outer side of the sleeve is also tucked, the upper end extending to the neck in raglan fashion.

7294 Girls' Dress.—Cut in sizes 6, 8, 10 and 12 years. In this pretty frock the closing runs diagonally from the center front of the neck down to the right side at the waistline, continuing straight down the skirt. The skirt has three gores and is plain at the belt.

7241 Children's Dress.—Cut in sizes 4, 6, 8 and 10 years. This pretty frock is made with a yoke which trims the back of the blouse at the top while the lower portion is gathered in both front and back. The neck is a little open with flat collar, which may be omitted.

7534 Ladies' Dress.—Cut in sizes 34 to 42 inches bust measure. This simple frock is suitable for home or street wear. The closing is at the front and the three-gore skirt may have high or regulation waistline. Such materials as serge, cheviot and gabardine are liked for these dresses.

7284 Boys' Suit.—Cut in sizes 2, 4 and 6 years. In this suit the plain jacket has a straight vest in front and this may be cut off at the waistline. The neck is high and the sleeves long, finished with collar and cuffs. The trousers have a straight edge at the knee.

6833 Ladies' Apron.—Cut in one size. Linen, gingham, calico or percale can be used to make this practical apron. The apron has a bib in the front only and fastens with string ties in the back at the waistline.

7581 Girls' Middy Dress.—Cut in sizes 6, 8, 10, 12 and 14 years. White linen is used to make the blouse of this dress and dark blue serge is used for the skirt. The blouse is separate and the plaited skirt is attached to an underwaist. The sleeves may be long or short.

7565 Ladies' Apron—Cut in one size. Any of the pretty flowered wash materials can be used for this apron. The apron can be worn with or without a dress and slips on over the head. The short sleeves end just above the elbow.

Price of any of these patterns 10 cents each.

A Marvelous Picture of

Abraham Lincoln

Attention Amercians

The Housewife

The American Woman

Wonder-Picture of Abraham Lincoln

All for 55 Cents Until

February 12, 1916

(Lincoln's Birthday)

What the 55c brings you:

THE HOUSEWIFE for a year. Published monthly since 1883, with the idea always in mind that "The Housewife Makes the Home and the Home Makes the Nation."

THE AMERICAN WOMAN—favorite story and household paper, also a monthly and also a long-established and widely-known publication for the American woman.

THE LINCOLN PICTURE is a wonderful drawing by a genius. It is a perfect likeness of the Emancipator made with a single continuous line exquisitely done. It is decidedly a work of art and worthy of a place in any home. Below the picture itself is a fac-simile of the immortal Gettysburg speech as it was written. The drawing and fac-simile have been made with one single continuous line from center to circumference. Every home, every schoolroom, every club room, every place or point where people meet or gather, should have at least one of these wonderful drawings on its walls.

Picture mailed postpaid.

The above offer will be withdrawn Feb. 12th. Send in your order now so you will have the picture before that date. You will be delighted with it.

WITH OUR ADVERTISERS.

1914 Seed Corn for Sale.

THE Dakota Improved Seed Corn Co., 27 Main St., Mitchell, S. D., has a limited supply of 1914 seed corn at special prices. See their advertisement on page 18 of this issue. Please mention this paper when you write.—Adv.

Northern-Grown Alfalfa Seed.

EVERY year there is more interest in alfalfa, clover and other grasses, which have proved so profitable on grain-belt farms. It is very important to get good seed and many experts agree that northern-grown seed is profitable. The Farmers' Seed & Nursery Company, 104 Third Avenue, Faribault, Minn., advertises fine northern-grown seed on page 17 of this issue. Write them for catalog and prices. Please mention this paper when you write.—Adv.

The "Hickory" Line.

THE Kelley-How-Thomson Company, Duluth, Minn., will be glad to send their free book on collars and harness to any reader of this paper who will write and ask for it, mentioning The Wisconsin Farmer in their letter. These people are makers of the famous Hickory brand, and most of our readers know the value of Hickory horse collars. There is probably a Hickory dealer in your neighborhood and you will see in his store a sign such as will be found in the Hickory advertisement on page 19. This dealer will be glad to show you the Hickory brand products. —Adv.

Upholstering for Automobiles.

A DEPANDABLE and serviceable upholstering for automobiles is Fabrikoid, made by the Du Pont Fabrikoid Company, Wilmington, Del. More than half of the 1916 model of automobiles are finished in Du Pont Fabrikoid. Fabrikoid is a standardized product which has met the severe tests of automobile use. Any reader of this paper may secure a sample by writing to the Du Pont Fabrikoid Company, Wilmington, Delaware, and asking for the same. Also ask for booklet No. 278, which tells more about Fabrikoid and its uses. See advertisement on page 15. Please mention this paper when you write.—Adv.

A Special Nursery Stock Offer.

KELLOGG'S NURSERY, Janesville, Wis., are making a special offer to introduce their well-known nursery stock. In this issue on page 18 they offer six apple trees for fifty cents, which is certainly an unusual offer on these hardy Wisconsin trees and one we believe our readers will appreciate. This nursery has been in Wisconsin for sixty-two years and are well known for their hardy trees and small-fruit plants. They have published a pamphlet containing a great deal of valuable information on the care of orchards and small fruits. In writing for it be sure to mention Wisconsin Farmer and address Kellogg's Nursery, Box 224, Janesville, Wis.—Adv.

Five Good Implements Discussed.

FIVE important products of the John Deere Company, Moline, Ill., are discussed this week in their advertisement on page 9. They are the John Deere corn planter, Van Brunt drill and seeder, John Deere spreader, John Deere disk harrow and the Dain system side rake. Each of these implements and the topic which each one naturally suggests are discussed in an educational way in booklets which are furnished free to any of our readers who will write to John Deere, Moline, Ill., and request them. There is a special booklet on "More and Better Corn," and another on "Bigger Crops from Better Seeds." In addition, there is the special John Deere spreader booklet and the free booklets describing the Van Brunt drills and seeders and the Dane system of air-curing hay. As before stated, any or all of these books may be secured without expense by writing and asking for them. We request that our readers who write mention this paper in their letter.—Adv.

Stubbs & Hyzer's Duroc Gilt Sale.

THE first Wisconsin sale of Duroc bred gilts of 1916 will be held January 31st by Stubbs & Hyzer, West Salem, Wis. This sale is one which our readers should not fail to attend. The outlook for breeders of pure-bred swine has never before been so good. The prospects for high pork prices for the coming year are very bright. There has also been a heavy slaughter of breeding stock this year, owing to the short corn crop. For these reasons there will be an unprecedented demand for breeding stock next fall and the breeders who are in a position to supply the demand will reap the benefits. The offering of Stubbs & Hyzer is largely of Knight the Col. breeding. This boar has probably sired more noted show boars than any other sire of the breed. There are also a number of gilts sired by Lee's Defender, grand champion at the 1914 Wisconsin State Fair. These sows and gilts are bred for spring litters to the boar, Lincoln Model, which won second at the 1915 Wisconsin State Fair and was declared by competent judges to be the equal of the senior champion boar. He is an excellent individual of Ohio Chief breeding. The sale will be held in the city of West Salem, so no driving will be necessary, which is a factor to consider in extremely cold weather. The sale pavilion is thoroughly comfortable, regardless of weather conditions. Catalogs, giving description and breeding of animals, is now ready and will be sent on application. Plan to attend this sale on Monday, January 31st, and be in a position to supply the demand for breeding stock next fall. See page 35. —Adv.

HEALTH COMFORT

Do away with the dangerous, unsightly, unsanitary outhouse. Enjoy the city comfort and convenience of a warm, odorless, sanitary indoor toilet. Protect your health. The

WOLVERINE Sanitary Closet

is a comfortable, permanent scientific substitute for the disease-breeding, water-polluting, foul outdoor privy. No water, sewer or plumbing. Endorsed by health officials. A cent a day operates it. Send for literature today.

THE J. L. BLODGETT CO., Hickory, N. C.

One of "Old Trusty's" Records.

WHEN an incubator will average 90 per cent hatches through twelve years of constant service it is what might be called "going some." That is the record reported by Bessie Warren, of Tyron, Neb., with an "Old Trusty" incubator, in the advertisement on page 28. The interesting 136-page "Old Trusty" book, telling of twenty years' experience in the building of incubators for 650,000 users, will be mailed you free if you will write today to H. M. Johnson Co., Clay Center, Neb., and mention their advertisement in this paper.—Adv.

Atwater's Duroc Sale.

L. F. ATWATER, Bangor, Wis., holds his annual sale of Duroc bred sows and gilts Tuesday, February 1st. The offering this year is in keeping with the usual high quality of Mr. Atwater's animals. They are of excellent breed type and well grown. They are of the same type that has won so consistenly in the big fairs the past several years and won the silver cup for this herd. Mr. Atwater is a discriminating judge of Durocs and by careful selection and mating of good animals of proven blood lines he has established and maintained a herd far above the average. The offering in this sale is practically of grand champion breeding. Of the forty-five spring gilts, two-thirds are either sired by or are out of daughters of Lee's Defender. He won grand champion honors at the 1914 Wisconsin State Fair. The balance of these gilts are sired by Corrector, Duchy Col. and Select Advancer and bred to Lee's Defender. The daughters and granddaughters of Lee's Defender are bred to Prince Illustrator, grand champion at the 1915 Wisconsin State Fair, and to Model King by High Model by Golden Model 2d. These blood lines will be recognized as second to none in the breed and by the many honors they have won in the show ring are proven to produce the most desirable type. The sale will be held in a comfortably heated, lighted, ventilated sale pavilion, which is comfortable under all weather conditions. Catalogs are now ready, giving pictures, descriptions and pedigrees. Plan to attend this sale in person, if possible, but if impossible make your selection from the catalog and send a mail bid to either the auctioneer, Col. T. E. Stickelman, Clarinda, Iowa, or H. S. Hoard, representative of The Wisconsin Farmer. See page 35.—Adv.

Farm surveys in the Lake Geneva district of Walworth county were started last fall by the United States Department of Agriculture and the Wisconsin College of Agriculture. This area is one of the best equipped farming sections in the state, as nearly every farm has a silo or two and is engaged in some form of animal husbandry under the most up-to-date methods.

Two prominent Wisconsin sheepmen, Arthur Broughton, Albany, and W. F. Renk, Sun Prairie, were recently re-elected members of the board of directors of the American Shropshire Registry Association and the American Hampshire Sheep Association, respectively.

LAMP WITHOUT A WICK

The Sunshine Safety Lamp Co., 827 Factory Bldg., Kansas City, Mo., has a new portable gasoline lamp which gives the most powerful home light in the world—a blessing to every home not equipped with gas or electricity. 300 Candle Power at one cent per night. This remarkable lamp has no wick and no chimney, is absolutely safe and gives such universal satisfaction they are sending it on Free Trial. They want one person in each locality to whom they can refer new customers. Take advantage of their free trial offer. Agents wanted. Write them today.—Adv.

VETERINARY

PROFESSIONAL Veterinary advice through this department to regular subscribers only. We do not answer veterinary inquiries for the benefit of "neighbors." Parties desiring information will be required to send their names in full with their address. No question will be answered by mail unless accompanied by a fee of one dollar. In order that correct information may be given, the symptoms should be accurately described, stating of how long standing, together with color and age of animal, and what treatment, if any, has been resorted to. Thoroughly good and reliable veterinary remedies are advertised from time to time on these pages. If they were not good and reliable they could not appear in our paper. Our readers are requested to look them over. You may find here some remedy which will exactly fit your case. All veterinary inquiries should be addressed to this office.

AILING ANIMALS.

Foot-and-Mouth Disease.

What animals are subject to foot-and-mouth disease?

Cattle and hogs are most susceptible to foot-and-mouth infection. Next in order of liability are sheep and goats, buffalo, American bison, camel, deer, chamois, llama, giraffe and antelope. Horses, dogs, cats and poultry have been victims of the disease. Man is also a rare victim.

Forage Poisoning.

What are the symptoms of forage poisoning?

The symptoms of forage poisoning vary greatly with the severity of the attack. In fatal attacks the first indication is a weak, staggering gait, total or partial inability to swallow solids or liquids, and impairment of the eyesight, twitching of the muscles and slight cramps may also be observed. As a rule the temperature is not elevated. These symptoms are soon followed by paralysis of the entire body, inability to stand and delirium, to be followed by a deep coma, which renders the animal quiet until he expires.

Eczema.

I have a calf about three weeks old which is all covered with scabs which break out every few days and fester. Can you tell me the reason? Do you think the barn is too warm?

The condition you describe indicates eczema. The treatment is often very difficult. You should examine the scabs carefully to detect the presence of lice, and if any be found your first course must be to destroy them. The sores may be treated by an application of white or blue ointment mixed with an equal part of fresh lard, and may be applied every second day, care being taken to prevent the calf from licking it off.

Paralysis.

I have a ten-year-old mare that had a stroke of paralysis in August. She seems well and hearty now but is easily excited and holds her head to one side and her neck is slightly crooked. Is there any danger of a second stroke, and how long would it be before you would expect the second stroke?

If this condition is the result of a mechanical injury to the spinal cord, from a broken bone or spinal hemorrage, the attack generally comes on gradually, although it may come on suddenly. When it is caused by agents in the blood the attacks may recur. It is impossible to foretell whether or not a second attack will occur or at what time to expect it if it should occur.

Thrush.

What is a sure cure for thrush for horse or mule?

There is no "sure cure" for thrush. Since the most common cause is uncleanliness and filth the first essential in the prevention or treatment of the condition is to render the stable or stall clean. The diseased and ragged portion of horn are to be pared away and the foot poulticed for a day or two with boiled turnips, to which may be added a few drops of carbolic acid. The cleft of the frog is then to be cleaned and well filled with dry calomel and the foot dressed with oakum and a rolled bandage. If the discharge is profuse the dressing should be changed daily, otherwise it may be left on two or three days.

Barking Trees.

My horses are barking my trees and eating the bark. They are cedar, elm and oak trees. They like the cedars best. These horses also are eating my barns, which are built of white pine and are new and painted. They are fed corn and oats and mixed clover and timothy hay and are turned out to grass or cornstalks and straw pile now when not working during the day. They get all the salt they want and are looking well.

As your horses are in good condition and your feeding does not seem at fault it must be something in the wood that they like, probably the tar present in the cedar and pine. It is hard to determine the exact cause. If they persist in this it would be advisable to protect the trees by wrapping with some suitable substance. If they gnaw the mangers you might try stripping the edges with iron stripping.

Absence of Heat Period.

I wish you would advise me what to do for a two-year-old heifer that will not come in heat. She is a good heifer, a Short-horn, well bred, very big and healthy.

This condition is usually a symptom of another local or general condition. An examination should be made to determine whether the heifer is normal or otherwise. A deformity, a plethoric condition or one of general debility are frequent causes of this trouble. You are advised to give two drams of aloes in conjunction with a tonic of iron, strychnine and arsenic.

Warts.

I wish you would advise me through your columns what to do for a heifer that has warts. They are very numerous around her bag and are getting large, seem to be uniting. They are also found all over her body. She will freshen in April. Have tried castor oil, but have had no success.

The warts can be removed with the scissors or can be twisted off with the fingers or ligatured by means of a rubber band or a horse hair. Their roots should then be cauterized with tincture of iron or lunar caustic. Acids should not be used in removing warts from the region of the eyes or mouth. You should give the heifer arsenic in the form of Fowler's solution, a tablespoonful and a half twice daily.

Animal Vices.

I have a good Scotch Collie dog that minds every word I say, but he always bites and pulls the cow's tail. He is about a year old and I have never been cruel to him in any way. When I scold him he is quiet, but when I start him after the cow again he does the same thing. I hate his doing it for it ruins the cow. Do you know of anything that will make him stop it?

The condition you describe is not a disease, but is a vice or bad habit, the result of lack of proper training. The dog no doubt thinks he is doing the very thing you want him to do. There is no set rule for overcoming such vices except careful, patient training until you have taught him what and how you desire him to act. It will require considerable effort, for you must first undo his present practice and then teach him all over again.

Lumpy Jaw.

I wish to ask a little information in regard to a Holstein heifer, seventeen months old. She has a swollen tongue and there seems to be much swelling under the jaw and she slobbers a little. She has been sick about two months. I called two veterinarians here to see her and they don't seem to understand the case. One thought she has slivers under the tongue, but there is nothing of the kind to be seen. They advised me to put mustard plaster on the swelling. I have done so and it hasn't broken yet. Her hide is terribly stiff. I would like to know if there is anything that could be done for her and if it is contagious.

The condition you describe is most probably actinomycosis or lumpy jaw. In case the bony structures of the jaw or head are not yet affected it may be possible to cure your heifer. Iodide of potassium should be administered in doses of one and one-half to two drams a day, dissolved in water and administered as a drench. The dose should vary with the effects produced. In the course of a week or ten days you should notice the skin becoming scurfy, weeping from the eyes, catarrh of the nose and loss of appetite. When these symptoms appear the medicine should be left off for a few days and afterwards repeated in the same dose. The milk should not be used during the treatment. The cure usually requires about three to six weeks. In case the above described symptoms do not appear it is evidence the animal is not susceptible to the curative effects of the drug and the treatment should then be abandoned. The animal can then be sold subject to inspection. The disease is not directly transmitted from one animal to another, but it is better practice to keep it from the other animals on the premises, especially after the tumor is discharging pus.

Montana, at the Panama-Pacific Exposition, won more prizes than any other state or country in the world, receiving 513 medals.

Montana Leads the World in Quality and Quantity Per Acre of Her Farm Products

In open competition with every state and nation in the world exhibiting at the Panama-Pacific Exposition at San Francisco, Montana won the grand prize for cereals; 9 medals of honor on wheat, oats, barley, flax, grains and general agricultural products; 73 gold medals, 236 silver medals, 195 bronze medals and 100 honorable mentions.

There are millions of acres of land just as fertile as the land which grew the prize-winning crops to be had cheaply. Much of this land is on and directly tributary to the lines of the

Chicago, Milwaukee & St. Paul Ry.

FARMING IN VILAS COUNTY.

(Continued from page 28.)

maintenance of good grade herds. Every farmer of every community should have a pedigree bull. The large farms can afford to breed such animals for distribution around the countryside. The amateur farmers with full-blood herds could perform a public benefaction if (as has been done by some) they were to give their surplus stock of bull calves (salable when young for only trifling sums) to selected farmers in their county who would agree to keep them for a reasonable term.

It is therefore good news whenever such a farmer comes into a community, and everyone should welcome the establishment in Vilas county by Mr. Bacchus, of Chicago, of a herd of pure-bred Guernseys. Mr. Bacchus is located on Lake Contest and Big St. Germain, and it is said he intends starting next year with 100 head of Guernseys.

The farmer needs the banker. The banker can vitally aid in the progress of dairy farming in this section. The title to cattle approved by experts and bought by money advanced by the bank can be retained by the bank until the cattle are paid for. In this way many a poor farmer can start a dairy herd. Local bankers must awake to the need and to this occasion.

Success will come as soon as the right men begin to take hold. Some capital or bank backing is needed, but the great thing is to have the start (both in dairy farming and in running creameries) made by the men who understand the conditions and who know how. Past failures have been due to the men who didn't know how.

J. C. Hendricks' Poland China Sale.

ON Wednesday, February 9, 1916, J. C. Hendricks, Hazel Green, Wis., will hold a sale of big-type Poland China sows and gilts at Hazel Green, Wis. The writer has just visited the herd and inspected the offering. This is one of the best lot of animals the writer has ever seen, both from the standpoint of type and size combined with quality. The offering consists of thirty-five spring gilts and five yearling and proven sows. The spring gilts at the present time range from 325 to 400 pounds and by sale date several of them will weigh 425 or over. The five older sows, although having had fall litters will weigh from 600 to 700 pounds. Although of exceptionally large size, and carrying seven to eight inch bone, they are not coarse nor rough. On the contrary they have short-wide heads, long, wide backs, deep sides and thick hams. They are not the refined, dainty type, but represent the best possible combination to be obtained. They have been produced by the careful mating of well-selected animals of proven blood lines. The aged sows are daughters of such boars as Gritters' famous A Wonder, Peter Mouw's Big Bone, Big Bug, which weighed 1,000 pounds at thirty months old, Wisconsin Giant, which won first at the Interstate Fair and Big leader by Giant Leader. The spring gilts are daughters of Repeater High Wonder, Black Jumbo, H.'s Jumbo and Smooth Wonder. Repeater is an exceptionally fine boar weighing 850 pounds at two years old. He is a son of Orange Big Bone and out of the sow, Orange Lady by Longfellow 7th. High Wonder is a son of Caverley's $600 boar, Long Wonder 2d. Black Wonder is a 1,000-pound boar by Heavy Bone, Smooth Wonder is by Wonderful by A Wonder. On December 30th Mr. Hendricks weighed every gilt and sow going into the sale and the following are some of the weights at that time: Five gilts from Big Daisy and sired by Smooth Wonder averaged 340 pounds. Four from Merry Miller sired by Repeater averaged 320 pounds; five from Wisconsin Giant sired by High Wonder averaged 330 pounds. Mr. Hendricks is issuing a very interesting catalog which gives the weight of each sow and gilt for December 30, 1915. These gilts are bred for spring litters to Repeater, High Wonder, Smooth Price, Northside Wonder and Oakland's Equal Jr. Smooth Price at twelve months of age weighed 550 pounds. He is an excellent individual of exceptional size, with a smooth, deep Body and ten inch bone. Northside Wonder is by Rood's Wonder by Fesenmeyer's noted A Wonder, and out of Orange Gem by J. O. James' noted boar, Big Orange. Oakland's Equal Jr. is by Irwin's $1,000 boar, Oakland Equal. Such lines of breeding will be recognized by our readers as the ones which have made the big-type Polands the leaders in the field. The sale will be held on the farm in a well-heated, lighted and seated sale pavilion. Railroad service has recently been inaugurated which makes it very convenient to reach Hazel Green from all points in Wisconsin, Illinois, Iowa and Minnesota. Arrangements have been made to meet those that come direct from the sale of Wm. Smiley & Son the day previous. Instructions for reaching Hazel Green conveniently from all points are given in the catalog. Send for a catalog and look it over carefully, plan to attend the sale if possible. However, if impossible to attend, make your selections from the catalog and send a mail bid and dscription of the type of animal you want either to Colonel Cottingham or to H. S. Hoard, representative of The Wisconsin Farmer. Mr. Hendricks states that all animals bought on mail bids may be returned if not satisfactory. See page 37.—Adv.

Edgewood Farms, Inc.

AT THE Edgewood and Lake Mills Holstein sales last May the Edgewood Farms purchased the largest number of the highest class females, including the highest priced females at both sales. These cows and heifers were bred to very high-class bulls. Most of the females of milking age had creditable A. R. O. records and those that have freshened since have been tested and have made as high as eighteen pounds in two-year-old form. Edgewood Farms products consist of Kieckhefers certified milk which bears an enviable reputation in the cities of Milwaukee and Chicago, also Edgewood Holsteins which come from an absolutely clean herd, regularly tested by the United States government. Note the advertisement on page 38 in which Edgewood Farms are offering some Holstein bulls for sale. Write for their pedigrees and prices.—Adv.

New York Holstein Sale.

HOLSTEIN breeders wanting the very tops will be interested in the big New York breeders' sale at Syracuse, N. Y., February 9th and 10th. Among the attractions are Korndyke Pontiac Pet and five of his daughters. This pull was sired by Pontiac Korndyke, the sire of eleven thirty-pound cows, and his dam, Pontiac Pet, has a record of 37.68 pounds of butter in seven days, which was the world's record at the time of making. There are numerous other bulls in this offering that are from high producing ancestry, and included are daughters of King Korndyke Sadie Vale, King Hengerveld Segis, Tidy Abbekerk Prince, with seven thirty-pound daughters to his credit in six months, Spring Farm King Pontiac 6th, the futurity sire and others. Catalog for this sale can be secured by addressing Holstein Sales Co., Managers, Elgin, Ill., as per the advertisement on page 36. Kindly mention The Wisconsin Farmer when writing.—Adv.

Smiley's Poland China Sale.

SMILEY'S annual sale of Poland China bred gilts will be held Tuesday, February 8th, at Albany, Wis. This herd of swine needs no introduction to the readers of The Wisconsin Farmer, for it is well known to our readers, both through the advertising which has been carried in our columns and through the many prizes they have won at the Wisconsin State Fair. The sale this year consists of forty-five head of spring gilts and four head of yearling and mature sows. The gilts are daughters of the splendid herd boars which have been in service for the past year, such as Major Hadley, Monarch, Wisconsin Jumbo 2d, Keefer's King and Orange Price. Major Hadley is well known to Poland China breeders. He has been a consistent prize winner himself and his offspring have won creditable honors wherever shown. At the 1915 Wisconsin State Fair his get won both the blue ribbons on get of sire and produce of sow. Monarch is a grandson of Major Hadley and was second-prize senior yearling at the 1915 Wisconsin State Fair. He is an excellent individual with heavy bone and a strong, arched back. Wisconsin Jumbo 2d is a son of the $1,500 boar, Longfellow Jr., and out of Miss Mouw, an 800-pound daughter of Big Jumbo. He is a strong, vigorous fellow with eleven-inch bone. Keefer's King is a well-bred boar, a grandson of Gritters' famous boar, A Wonder. His litter brother sold for $440 in public sale. He has a good back, wide and even, with very heavy hams. Orange Price is a line-bred son of Miller's Chief Price and his dam is by Miller's Big Orange, making his a richly bred animal. He is a big fellow, a very long and smooth-bodied, heavy-boned animal and a good sire. Oakland's Giant is a son of the $1,000 boar, Oakland's Equal. The dams of these gilts are mostly mature animals weighing 700 to 800 pounds. They are the sows that have produced the show animals for the Smiley prize-winning herd and many of them are prize winners themselves. The gilts and sows have been bred for March and April litters to the above boars and to Major Miller and Big Hadley, Mouw's Wonder 3d, Big Bone Jumbo. Major Miller won first at the 1915 Wisconsin State Fair. He also headed the herd that won second and the herd that won first as get of sire by Major Hadley. Big Hadley is by Big Top, a prize-winning boar, and out of a daughter of Jumbo Hadley, grand champion boar at the 1915 Wisconsin State Fair. Mouw's Wonder 3d is a grandson of Smooth Wonder. Big Bone is by Big Jumbo and out of Wonder Girl, a granddaughter of both Big Bone and Long Wonder 2d. From the above breeding it will be seen that the best of proven lines of blood are represented in these animals. An instructive and interesting catalog is now ready, giving pictures, description and pedigrees. Send for it at once and look it over. When writing kindly mention The Wisconsin Farmer. See page 37.—Adv.

Dunham's Percherons.

WHEREVER the draft horse exists the name of Dunham is a household word. For fifty years the Dunham Percherons have stood in the front row. The late M. W. Dunham pioneered the draft horse field and brought to the country the best representatives of the great French draft horse. He established a reputation for broad gauge business methods, honest dealing and high-class horses that is being fully maintained by the present management, which is under the active direction of W. S. Dunham. At this time, as always there is to be found in the stable at Wayne, a lot of outstanding horses, the rugged, quality kind, good ages, solid colors, that will be sold worth the money and on very satisfactory terms. It hardly seems necessary for any commendation of Dunham's horses or Dunham's business methods at our hands. Both are firmly established in the favor of the buying public and both can be depended upon to fully meet any demand that may be made upon them. A handsomely illustrated catalog will be sent to any address upon application to Dunhams, Wayne, Ill. Kindly mention this paper when you write. The advertisement appears on page 39.—Adv.

Harvey Little's Short-horns.

SOME choicely bred yearling Short-horn bulls of heavy milking strains are advertised for sale on page 38 by Harvey Little, Evansville, Wis. This herd has been established over forty years and a fine lot of cattle have been developed. Milk records have been kept for a great many years and cows producing from 10,000 to 11,000 pounds of milk per year are usual. Many of the heifers with first calf have produced 8,000 pounds of milk. The majority of the females in the herd at the present time are daughters of Demonstrator 3d and Roan Clay. Demonstrator 3d was an excepitonally fine animal individually and in breeding. He was sired by Young Fellows 121660 and out of Mason Duchess 15th by Morning Star. Roan Clay was sired by Demonstrator 3d and out of Janesville Rose 12th by Gifford Clay. Although the milking ability of the cows has always been kept firmly in mind, good size, constitution and type have not been negelcted and the young bulls advertised for sale show the result of this careful breeding. When writing kindly mention The Wisconsin Farmer. —Adv.

STUBBS & HYZER'S SALE

BRED DUROC GILTS AND SOWS

WEST SALEM, WISCONSIN

MONDAY, JAN. 31, '16

50 BRED GILTS AND SOWS sired by **King the Cols.**, the sire of more prize winners than any other sire of the breed; **King the Cols. 2d,** a son of King the Cols.; **Lee's Defender,** grand champion at the 1914 Wisconsin State Fair. These are bred for March and April farrow to **Lincoln's Model,** that won second at the 1915 Wisconsin State Fair. He is a richly bred Ohio Chief strain boar. Sale held in the city. No driving. Send for catalog. I. E. Stickelman, auctioneer. H. S. Hoard will represent The Wisconsin Farmer.

STUBBS & HYZER -:- **WEST SALEM, WIS.**

L. F. ATWATER'S GREAT DUROC

BRED SOW SALE

BANGOR, WIS., FEBRUARY 1, 1916

47 HEAD OF CHAMPIONSHIP CALIBER AND BREEDING

30 GILTS OUT OF BLUE RIBBON SOWS

These are sired by the great Lee's Defender, and their dams are the sows I won my ribbons on at the state fairs this last summer.

10 GILTS OUT OF LEE'S DEFENDER SOWS

Their sire is Select Advancer, he by Chief Select, a full brother to Cherry Chief. Here is breeding unexcelled anywhere.

5 GILTS BY CORRECTOR

He by Sensation Wonder and out of a Golden Model 2nd dam. These five are bred to Lee's Defender; they are sure grand champion stuff, as Lee's Defender and Corrector were twice awarded the purple ribbons.

2 GREAT FALL SOWS

Sired by Lee's Defender; their dam a full sister to the sow that won three grand championships at the big fairs in 1915. These two sows themselves were first and second and trophy winners at two of the big shows in 1915.

Remember, two-thirds of this offering bred to farrow in March. I. E. Stickelman, Auctioneer. H. S. Hoard, Wisconsin Farmer field man. Send for my Catalog today.

L. F. ATWATER **BANGOR, WISCONSIN**

Madson's Big Poland China Sale.

FORTY big, cholera-immune Poland China bred sows and gilts will be sold at public auction on Friday, February 11th, by M. Madson & Sons, Madison, Wis. The Madson herd of Poland Chinas is one of the best in the state. Their high quality and type is shown by the fact that they have been among the heaviest winners at the Wisconsin State Fair for the past five years. By careful breeding they have developed a big, growthy type of hog that carries more than usual amount of quality. Although of big size, they carry long, wide backs, deep sides, deep, thick hams, with ample bone to carry their weight and keep them well up on their toes. They are also firm believers in vaccination against cholera, having used it successfully for several years. The entire herd is immune again cholera, which is a factor of much importance to buyers. The offering this year consists of thirty spring gilts and ten fall, yearling and proven sows. The spring gilts are daughters of Correct I Am, a big-type boar of excellent quality and type. He won junior championship honors at the 1914 Illinois and Minnesota State Fairs. His sire was Correct I Know, grand champion at the 1915 South Dakota State Fair, and his dam, Mammoth Maid 2d, was the dam of the prize-winning herd in 1914-1915 Minnesota State Fairs. The fall gilts are daughters of Royal Model and Badger Perfection, that sired the grand champion sow in 1913. These sows and gilts are bred for March and April litters to Triumph, an outstanding son of Hidestretcher, grand champion at the 1915 Wisconsin and Illinois State Fairs. The dams of the sows offered for sale are mostly mature sows of excellent type, with deep, wide bodies, thick, well-let-down hams and heavy bone, many of them being prize winners themselves. The gilts are big and growthy, many of them at sale time will weigh close to 400 pounds. The sale will be held in Dr. J. P. West's veterinary barn, 753 East Washington Avenue, Madison, Wis., five blocks from the Chicago & Northwestern station and east-side Chicago, Milwaukee & St. Paul station. The barns are comfortably heated, lighted and ventilated. As the sale will be held in the city, it will not be necessary to drive out in the cold and snow in case of bad weather. Everything will be comfortable regardless of weather conditions. Friday evening after the sale the Wisconsin Poland China breeders will hold their annual business meeting at the College of Agriculture. The ten-day farmers' course will also be in session. Every Poland China breeder or prospectve breeder in Wisconsin and adjoining territory should plan to be in Madison at this sale and attend the meeting in the evening. Catalogs of the sale, containing pedigrees and descriptions, will be sent on application. When writing kindly mention The Wisconsin Farmer. See page 37.—Adv.

Bernd's Short-horns and Poland Chinas.

ONE of the best herds of Short-horn cattle and Poland Chinas in upper Wisconsin is that of W. J. Bernd, New Richmond, Wis. He is a careful, discriminating judge of live stock and has developed excellent herds. That his herds rank with the first in the state is shown by the consistent way in which they have won at the leading fairs in this territory. By careful mating of good animals and persistently following up with good feeding he has developed herds above the average in quality and type. At the Beaver Dam Fair which is conceded to be the greatest county fair in the United States, Mr. Bernd's Poland Chinas won every first but one and first and second on all sows a year and under in again with six herds showing. The majority of the young animals in the herd which are offered for sale were sired by King Jumbo, that won first as a yearling. He is a son of the great boar, King Jumbo that weighs 1,106 pounds and is the heaviest boar in Iowa. His dam is

Homestead Farm Guernseys

TEN bulls, grandsons of Governor of the Chien; from 1 to 15 months; mostly from A.R.O. cows with records up to 566 lbs. fat. Prices reasonable.
W. G. Jamison & Sons, Appleton, Wisconsin

Queen of All by Giant King, is heavy in Peter Mouw breeding, tracing to Chief Price, Long King and Long Hadley. Mr. Bernd is offering sixty yearling and spring gilts for sale and has a number of excellent young boars. The fall yearling gilts are mostly bred for March and April farrow. Some of the spring gilts are already bred, but others will be sold open or bred for April and May farrow. The sows are bred to Big Wonder, first-prize under six months boar at the 1915 Minnesota State Fair with twenty-eight in the ring. He is sired by Smooth Wonder bred by Peter Mouw and out of Big Mollie bred by Peter Mouw. He is backed by Peter Mouw breeding for several generations. These gilts are, therefore, valuable not only for themselves, but also on account of the litters which they carry. In Short-horn cattle Mr. Bernd is offering twenty-five registered cows and heifers ranging from six months old up to mature cows, and ten fine yearling bulls. These are of Scotch and Bates breeding of heavy milk producing strains. Mr. Bernd raises the large type of Short-horns, showing one cow at the fairs that weighed 2,040 pounds. The sire of the bulls and heifers offered for sale were sired by Highland Sultan, that won third at the International. He is a son of the $1,000 bull, Orange Sultan by Whitehall Sultan. Quite a number of these bulls and heifers are out of daughters of Rosebud Champion, that won second at the International in 1908 and weighed 2,400 pounds. Some are out of Bates bred cows that are going at the rate of 8,000 to 9,000 pounds of milk a year with ordinary herd care and pasture feeding. Mr. Bernd can supply a fine lot of breeding stock in either Polands or Short-horns and we recommend our readers to get in correspondence with him whenever in need of breeding stock. See this page.—Adv.

E. W. Hendricks' Poland China Sale.

THE third sale in the southern Wisconsin Poland China sale circuit is that of E. W. Hendricks, Hazel Green, Wis., to be held Thursday, February 10, 1916. The offering in this sale consists of twenty-seven spring gilts, nine fall yearling gilts and three proven sows. These are exceptionally good individuals of size, combined with quality. The spring gilts are daugthers of Peerless Wonder, Black Jumbo and Great Leader. Peerless Wonder is a son of Fesenmeyer's noted boar, A Wonder, whose reputation as a breeding sire is known to all big-type breeders. His dam is Queen Giantess 4th of the noted Giantess family. Black Jumbo is one of the largest and best sires in the corn belt. He is a Mammoth fellow weighing 1,100 pounds in show condition and only three years old. Although exceptionally large, he is not coarse and full of deep wrinkles. He carries full eleven-inch bone, has a strong back and is well up on his toes. He was sired by Heavy Bone by Big Bug by Big Bone. His dam is Big Molly by Chief Nelson by Peter Mouw's noted boar, Chief Price. Great Leader is by Tecumseh Leader the noted boar of E. A. Fraser that weighed 1,055 pounds at twenty-nine months of age. His dam is Miss Nelson Prospect 2d by Jumbo Big Prospect, John B. Lawson's noted sire. Five of the fall gilts are daughters of Oakland's Equal, for which J. B. Irwin paid $1,000. Five fall gilts and four tried sows are by Big Jumbo whose breeding is given above. Three proven sows are by Giant Big Bug by J. C. Big Bug by Big Bone. Two of these sows are out of daughters of Fesenmeyer's noted boar, A Wonder. These gilts are bred for spring litters to Big Oakland, a son of $1,000 Oakland Equal and out of an A Wonder dam. Some are bred to Long Joe by Big Special and out of a daughter of Fesenmeyer's noted boar, Big Joe. Some are bred to R.'s Wonder by Rood's A Wonder and out of a daughter of the $1,500 boar, Longfellow Jr. It will be seen that these gilts and sows are not only well bred themselves, but they carry litters that are very valuable. Mr. Hendricks is a discriminating judge of good Poland Chinas. By careful selection and mating of good individuals of proven blood lines, he has developed a herd far above the average, and our readers will be well repaid by attending this sale. Catalogs giving description, breeding, etc., has been issued and will be sent on request. Send for a catalog and look it over carefully. See page 37.—Adv.

Frank Morley's Short-horns.

ONE of the young bulls advertised for sale on page 38 by Frank Morley, Baraboo, Wis., is out of the cow, Sapphire Jewel 139388. This young bull is ten months old, is well grown, of good type and white in color. His dam is a cow of large size, smooth, of pleasing conformation and a good milker and a good feeder, a typical farmer's cow of the "double-deck kind." She was sired by Ardlethen Sapphire 308301 and out of Lioness 58255 by Young Abbotsburn 3d 226360, one of the noted bulls of his time. This young bull is fit to head a pure-bred herd of merit. For further information write to the above address.—Adv.

Butler Tank Heaters Easily Regulated.

BUTLER'S welded tank heaters keep water at just the right temperature for live stock throughout the coldest winter weather. They are easy to regulate and will keep fire with any kind of fuel from fifteen to twenty-four hours. The ashes can be removed without disturbing the fire. For descriptive pamphlet write to Butler Mfg. Co., 927, Sixth Ave., S. E., Minneapolis, Minn., and kindly mention their advertisement on page 12.—Adv.

FUTURITY classes for senior and junior calves at Iowa State Fair, American Royal, Kansas City, and International Live Stock Exposition, Chicago, are announced for 1916. These classes are endowed with liberal prize money. Entry blanks will be furnished to all who entered last year without application in time for entries to be made, but will be pleased to hear from new intending exhibitors. Address American Short-horn Breeders' Association, 13 Dexter Park Ave., Chicago, Ill. See page 38.—Adv.

THE CREME-DE-LA-CREME . . . **HOLSTEIN BREEDING**
Sale pavilion, Syracuse, N. Y., Feb. 9 and 10
New York State Breeders' Sale

AMONG the chief attractions are: Korndyke Pontiac Pet and 5 of his daughters. His sire: Pontiac Korndyke, sire of eleven 30-lb. cows. His dam: Pontiac Pet 37.68 lb. butter in seven days. The World's Record at time of making. Many other bulls of splendid breeding. Daughters of King Korndyke Sadie Vale. His daughters, age considered, exceed in production the daughters of any other sire. Daughters of King Hengerveld Segis, he by King Hengerveld from a 30-lb. daughter of King Segis. Daughters of Tidy Abbekerk Prince, seven 30-lb. daughters in seven months. A whole bunch of heifers sired by a son of the 38-lb. cow, Pontiac Lady Korndyke, two of whose sons brought $37,500 in the Dollar Sale. Daughters of Spring Farm King Pontiac 6th, the futurity sire. And others that will surely please you and prove money-makers. Write at once for catalog, mentioning The Wisconsin Farmer.

Holstein Sales Co., Sale Mgrs. Elgin, Illinois.

TOO LATE TO CLASSIFY.

BIG-TYPE POLAND CHINAS

SPRING GILTS. Some now bred for March and April litters. Others will be bred for April and May litters or will be sold open as desired. There are daughters of **King Jumbo** by Long Jumbo, that weigh 1106 pounds. **Fall Yearling Gilts,** bred for spring litters to **Big Wonder,** first prize under six months boar at 1915 Minnesota State Fair. **Some Fine Yearlings and Spring Boars** that will do you a lot of good. **SHORT-HORNS. 10 Fine Yearling Bulls,**—roans, red and whites, sired by **Highland Sultan,** a grandson of Whitehall Sultan. **25 Cows and Heifers** from six months old and up. These are of Scotch and Bates breeding. Most of them are of heavy milk producing strains. If you want Short-horns of big size you can get them here. My Short-horns won all first prizes but one at the 1915 Beaver Dam Fair against heavy competition.

Smiley's Annual Big-Type Poland China Bred Sow Sale

Albany, Wis., Tuesday, February 8, 1916

The Type of Gilts in the Sale

45 SPRING GILTS; six fall yearling and mature sows. These are sired by Major Hadley, our noted sire of prize winners; Wisconsin Jumbo 2d, a son of the $1,500 boar, Longfellow Jr.; Monarch, weighed 800 pounds and won second at 1915 Wisconsin State Fair; Keefer's King, a grandson of old A Wonder; Orange Price by Miller's Big Orange. These are bred to Major Hadley, Wisconsin Jumbo 2d, Monarch, also Major Miller, first-prize yearling at 1915 Wisconsin State Fair; Big Hadley (by Big Top), Mouw's Wonder and Big Bone Jumbo. These are of good size and quality. The type that have won us so many blue ribbons at the state fair. Send for catalog containing eight illustrations, descriptions and pedigrees. Train service has been arranged to get to J. C. Hendricks' sale the day following at Hazel Green.

J. C. Hendricks' Big Sale

HAZEL GREEN, WIS., WEDNESDAY, FEB. 9, 1916

BIG type, big bone, big litters, big quality. Forty head of great sows and gilts that for size, length, bone, quality and feeding propensity will please the most fastidious buyers. Five tried sows, all having raised fall litters, sired by A Wonder, Wisconsin Giant, Big Bone, Big Bug and Big Leader. Thirty-five spring gilts, mostly March farrow, sired by Repeater, High Wonder, Black Jumbo, Smooth Wonder, Giant Defender and H.'s Jumbo, and are bred to Repeater, the greatest two-year-old boar living, weighing 810 pounds after service; High Wonder by Long Wonder 2d, the $600 boar. He sired first and second-prize under six months gilt in futurity class and second on produce of sow at Milwaukee this last fall. Others will be bred to Smooth Price, the largest and heaviest boned boar in the state. Weighed 550 pounds at twelve months and has a ten-inch bone, and North Side Wonder, a big, rugged, extra heavy-boned boar by Rude's Wonder by A Wonder, dam Orange Gem by Big Orange. He is a 1,000-pound boar at maturity. These gilts were all weighed on December 30th. They range in weight from 300 to 390 pounds in growing condition. They must be seen to be appreciated. Big Daisy has five dandy gilts, March 5th farrow; average weight on December 30th, 345 pounds; sired by Smooth Wonder. Wis. Giantess has five gilts, farrowed March 12th; average weight December 30th, 335 pounds; sired by High Wonder. Mary Miller has four gilts, average 325 pounds, and others are just as good. These are only a few samples. Send for catalog, which gives weight of each sow and gilt. It is instructive. Auctioneer, Col. Ira Cottingham. H. S. Hoard will represent The Wisconsin Farmer. Send your bids to him and I will guarantee entire satisfaction.

J. C. HENDRICKS HAZEL GREEN, WISCONSIN

Madson's Big Poland China Sale

Friday, February 11, 1916, Madison, Wis.

(Wisconsin Poland China Breeders' Annual Meeting Held Friday Evening)

30 Spring Gilts, 10 Yearling and Mature Sows

Cholera Immune Cholera Immune

Sale Held in Dr. West's Veterinary Barns

NO DRIVING in country necessary; 753 East Washington avenue. Building well heated and lighted. The spring gilts are sired by the big-type boar, **Corrector I Am, junior champion boar** at the Minnesota and Illinois State Fairs in 1914. He is by Correct I Know, grand champion South Dakota State Fair. The fall sows are by **Royal Model and Badger Perfection.** These gilts are bred to the big-type boar, **Triumph,** by **Hidestretcher,** grand champion at the 1914 Minnesota State Fair. These sows are big, well developed, combining quality with size. They will produce the profitable type of hogs and the type that will win in the show ring next fall. Send for catalog. Plan to attend this sale and the Wisconsin Poland China breeders' meeting in the evening.

HOLSTEIN-FRIESIAN CATTLE.

Upland Farms, Walworth, Wis.

E. E. Ayer, Prop. **J. H. Travis, Manager**

OFFERS a number of very choice yearling Holstein bulls ready for service. They are well marked—of good straight conformation and well grown. These young bulls are choicely bred, being sons of the 27-lb. bull, **Sir Pontiac Artis Duke 77994,** a son of the 31.71-lb. bull Sir KorndykePontiac Artis that has 45 A. R. O. daughters. His two nearest dams average 29.42. His three nearest sires have 158 A. R. O. daughters, eleven with records over thirty lbs. Send for pictures, pedigrees and descriptions.

Purebred Registered
HOLSTEIN CATTLE

A Holstein owner's assets. When a man buys a pure-bred Holstein-Friesian animal he acquires more than flesh and blood as property. Something more than size, weight and individuality, breeding, and the highest standard of productiveness. He shares the beneficial influence of the Holstein-Friesian Association, its financial soundness, its mighty prestige, its progressive exploitations, its animal prize offerings of $22,000, and its effective $25,000 yearly publicity, all of which combine to make a wonderful asset. It is this truthful exploitation of the foremost dairy cattle, together with their genuine merit, which has since 1908 raised the average auction price of Holstein cattle by $105 per head. Investigate the big "Black-and-Whites."

Send for **FREE** *Illustrated Descriptive Booklets*
The Holstein-Friesian Association of America
F. Houghton, Sec'y, Box 143, Brattleboro, Vt.

Overland

You Can Now Get the Big Comfortable 35 Horsepower Overland for

$695

En bloc 35 horsepower motor
Electric starting and lighting system
Electric control buttons on steering column
Four inch tires

Roadster $675
f. o. b. Toledo

Demountable rims; with one extra
106-inch wheelbase
Deep divan upholstery
One-man top; top cover

Model 83 B

With unerring judgment of value—

With a rush that swallowed up a record production in jig time—

The public took more than 50,000 of the $750 Overlands in six months.

In six months we've absorbed all the overhead; absorbed all the development expense; realized on all the experimental cost that is usually spread over a year.

We covered our material requirements at before-the-war prices—saved three and a half million dollars on aluminum and another million on steel.

We have increased our production capacity of 300 cars per day last June *to 1000 cars per day.*

So again we have broken *all* records.

Again we have planned and bought material for a bigger production program.

And again we are setting a new and supreme standard of value—

You can now buy the big, roomy, comfortable, thirty-five horsepower Overland for $695.

Here is the value which has clearly dominated the automobile market for the last six months—now made even more clearly dominant.

Here is the car with a performance record never even approached by any car of its size ever built—fifty thousand in every day service.

And though the price is reduced the car is improved.

It has an up-to-the-minute power plant, en bloc type, developing full thirty-five horsepower. It has abundant power and speed and an exceptionally quick get-away.

The value is pre-eminent—unapproached.

We guarantee that the price for this model will never be lower.

But this price reduction is made in the face of a rising material market—we cannot guarantee that it will not be higher.

See the Overland dealer now—anticipate your requirement if need be—but make sure of your delivery *now.*

Catalog on request. Please address Dept. 112.

THE BROOK IN WINTER

80% More Power

HUDSON SUPER SIX TRADE NAME REG

Efficiency Almost Doubled Without Any Added Size in the

$1375 at Detroit

Patented by Hudson
December 28, 1915
Patent No. 1165861

Hudson Super-Six

Costly Cars of Every Type Outrivaled

THESE are facts of overwhelming import to a man who buys a car.

A new invention—called the Super-Six—has proved itself by 80 per cent the best motor in the world.

It has been compared, in official tests, with the finest cars heretofore built. That includes Eights and Twelves. And, against them all, it has won the world's records.

So the Super-Six stands supreme. Not by any minor margin, but by 80 per cent, as compared with like-size motors of the past.

A HUDSON PATENT

This motor is a Hudson invention, secured by Hudson patents. No other car has anything like it. So what this car does is not even approached by any other car in the field.

Please remember that. Last year many cars had motors much alike. Now this one car—the Hudson Super-Six—has an 80 per cent better motor. And the results of that supremacy mean everything to you.

IT HAS 76 HORSEPOWER

This motor is a small, light Six. The size is identical with last year's Hudson Six-40.

But old-type motors in this size yielded about 42 horsepower at their best. The Super-Six delivers 76 horsepower.

Just consider what that means. Think of almost doubled power without added size.

Think what vast reserve power. Hills are climbed without effort. The hardest roads are easy. You can creep on high gear. You can pick up instantly.

BIRD-LIKE MOTION

What we have done by this invention is to end vibration. We have built the smoothest-running motor ever known.

All this 80 per cent of added efficiency is power that was heretofore wasted. It was consumed within the motor.

So that means vast fuel economy. It means almost no engine wear. It saves your tires by saving jerks. It means a saving in these ways of hundreds of dollars.

And riding is like flying in this Super-Six. You never knew such luxury of motion. The car is so quiet that it seems to move by magic.

No more power is created than in former like-size motors. No more fuel is consumed. But you get 80 per cent more efficiency from it by this saving in vibration.

YOU WILL WANT IT

Once ride in the Hudson Super-Six and no other car will content you. You will laugh at a car about half as efficient, with a motor just as large.

The vast reserve power, this smoothness, this flexibility multiply the joys of motoring. And the luxurious bodies—the finest you have ever seen—make the car look its supremacy.

Yet, with all these advantages, the Super-Six is an economy. We are building this season $42,000,000 worth. This matchless output in a fine car gives you a value heretofore unknown.

This enormous saving in fuel, in engine wear and tires amounts to vast sums in the long run. A car without this motor, sold at half the Hudson price, might cost you more than this.

Let the nearest Hudson dealer prove these facts to you. Go riding with him. See the luxury of the Super-Six. When you do that you are bound to want this car.

FAMILY CIRCLE TALKS
BY THE PUBLISHER

AN ARGUMENT AGAINST CONSOLIDATION.

I AM greatly interested in a point which several of my readers make when they write to me discussing the practicability of the consolidated school. They call my attention to the fact that in many instances the school bus calls at such an early hour the children are obliged to leave before daylight, while they do not get back until night-time. The effect is not hard to imagine. Here is the way one of my correspondents pictures it:

A child going to consolidated school has no time, morning or evening, for the little chores that farmers' children ought to do and by the time they have finished school they will have acquired the dress-and-go habit to such an extent that chores and chore clothes will have no charm for them.

Printing this in one of my farm papers has brought a chorus of commendation from the opponents of the consolidated school plan, one of whom writes me:

Please put that in capitals, for it is the very soul of the question. A boy or girl who does not learn to work with his hands or head prior to sixteen years of age is not likely ever to become able to earn a living on a farm.

This, I believe, is an argument against the consolidated school fully as strong as the increase in taxes, concerning which many of my readers write me. Nor is the complaint an exceptional or isolated one, for at least a half dozen have called the matter to my attention within the last week or so. Here, for instance, is an extract from one letter:

When it comes to gathering the little children in the hack at six o'clock in the morning, cold, wintry weather, and hauling them from eight to twelve miles, I don't think they enjoy it very much. The hack passed my place last winter a good many mornings before daylight. Now, would you like to start a little fellow out that is only five or six years old, in the cold, to ride that distance? I don't think you would. When we have our rural schools the parent hitches old Dobbin up and takes the little ones to school in place of depending on some careless boy to drive the hack.

And here is the way another reader puts it:

There are lots of little folks that have to get into these school wagons as early as seven o'clock in the morning and these same little tots don't get home again until six o'clock at night. That isn't so bad in the early autumn and again in the spring after the weather warms up and the roads are good, but take it in the winter when the days are short and you have to rout little folks out of bed long before daylight and start them out in the wagon before sunrise. In a few years their health will be ruined and then what good will their education do them?

Certainly, my friends, this is a serious objection to a plan which undoubtedly has many merits. What does it value, indeed, if we educate our children as well as town children are educated, but ruin their health in so doing? What does it value if we educate them thus, but make them helpless, unable and unwilling to do farm-home chores, imbuing them with the "dress-and-go" habit, as one of my correspondents so aptly puts it?

The consolidated school has come to stay; I do not doubt that for a minute. But, on the other hand, we must not overlook or forget the facts that 64 per cent of all the children who go to school in the United States never go to any other than the one-room rural school, that the great majority of them never finish the eighth grade, and that 80 per cent of the schools in thirty-two of our states are one-room country schools. The problem we must confront is how to make conditions better in these schools which serve so large a percentage of our little folks.

Whatever we may think of the consolidated school, we must not give it all our attention and forget or ignore the one-room country school, with its great mission to educate the bulk of the children of America. You, in your community, may be willing to wake your children up in the wee small hours and send them far away for the entire day, for the added benefit that comes with the consolidated school. But, remember for every child thus enabled to get what you are pleased to call "superior advantages" there are hundreds who must depend on the old-fashioned, one-room school. The problem is to make those better and more efficient, for while the 2,000 consolidated schools in the United States cater to thousands of children, the one-room country school is still far in the majority and its needs are great. I cannot do better than to leave this thought with you, borrowed by me from one of the speakers at a recent country life conference in one of our great grain-belt states:

Do you remember the first day that your little child went to the rural school? That day stands out in your memory if you are a parent as one of the great days of your life. That morning he went from the home with its carpets, pictures, flowers and home comforts, down the flower-bordered path, through the gate and perhaps up the near-by hill to a dingy, unpainted, low-ceilinged, barely furnished room called a public schoolhouse. There your child went to spend years before entering the modern high school or the splendidly equipped college or university. The city and town pride themselves on their splendid buildings, but because of the selfishness or indifference of so many of our country people the rural schoolhouse is actually a disgrace to the community. We have in mind a school district we visited in Vermilion county, Illinois, populated by prosperous farmers, where the school building was the same old log house that had served in that capacity for seventy-five years, with just a few narrow, dingy windows, a low ceiling and most uncomfortable surroundings. Is it any wonder the children do not want to go to school? The wonder to me is that any of them want to go to such buildings.

Shall we join hands to better conditions, before it is too late, no matter how we may differ on the consolidated school, early rising, chore-doing and all manner of other things?

THE FUN OF THE OLD DAYS.

ONE of the subjects discussed at greatest length and with most interest at the farmers' week exercises of one of our grain-belt agricultural colleges recently was that of farm amusements. Most of the speakers declared that the fun crop is short, no matter what bumper crops of wheat and oats and corn we are raising nowadays. Many went so far as to say this was one of the main reasons why our young folks are being lured away to the towns and cities in such large number. The problem was conceded to be a big and vital one.

Personally, I think this problem is being best and most widely solved by the neighborhood farm club movement and the community clubhouse plan. I am delighted at the reports which come to me every week, telling of farmers' club rooms being established, in small towns, by banks and merchants and frequently, right in the country, far from any town, by the farmers themselves, desirous of a meeting place where harmless fun may be had by all.

I realize, however, that not every community can have these advantages, even in these prosperous times. But why cannot every community have the desired fun and recreation by means of neighborhood clubs and frolics and a return to the good old days of husking bees, apple parings and so on? These things are possible wherever there are two or more families within reach of one another, and what a royal good time can be had when congenial people get together, put all thoughts of work aside and let joy reign supreme for the time being.

This very subject was on my mind the other night when I picked up a country newspaper and read the editor's recollections of an old-fashioned apple paring. He had just read some new-fangled recipe for drying apples by machinery and was moved to wrath and to reminiscences. He harked back to the days of his youth, when the apples had been gathered into shiny heaps of red and green and gold among the leaves between the rows of orchard trees and were covered with blankets to keep them from the frost. He recalled how the word passed around the countryside—no need of telephone or R. F. D. when a good time was in store, it "grapevined" around in some mysterious way—"There's going to be an apple paring down to Joe Black's Tuesday night," and the young folks—and the old, too—gathered together and worked hard for a while and then played just as hard. It made me homesick for the good old days to read his description:

The apples were brought in from the orchard in sacks and bushel baskets and dumped in piles on the kitchen floor, and the work sort of divided itself naturally. Some pared, some quartered and cored and others strung the pieces on strings. The boys who had the best jackknives generally did the most of the peeling, tossing the pared apples into big tin pans. The girls were given darning needles threaded with strong linen a yard or so long and on this they strung the quartered apples and, when the string was full, tied the ends together.

The apples on strings were hung to dry from slats suspended from the kitchen ceiling. When a pie was wanted any day through the winter the housewife simply stood on a chair and took down a festoon of dried apples and there she had the material right at hand. Sliced pumpkins used to hang there with the apples, and a few of the largest and choicest ears of corn for seed next spring.

But it was not all work and no play; that would never have done. Young and old joined just as heartily in the merrymaking as they had in the work. Doesn't it make the old days compare pretty favorably with these piping times of prosperity nowadays, so far as the real enjoyment in life is concerned, to read something like this:

The best fun, and the climax of it all, came along about eleven o'clock, after the last string of apples had been hung, and the parlor floor was cleared for action, the center table with the family Bible, the plush album and the enlarged picture of grandfather in the shell frame being removed to the hall to keep it from being upset.

After the doughnuts and sweet cider had been passed around the games began—"postoffice," "clap in and clap out," "drop the handkerchief," "button, button, who's got the button," and then, along about midnight, the girls got their wraps, the boys assembled outside in front of the door, and as the girls came forth a young man stepped up to each and offered his arm. This we called "pairing off," and sometimes there was a good deal of rivalry in it, and some hard feelings.

Oh, those long walks down the road, with the girl of your choice at your side, her cheeks as rosy as the red muffler around her neck which her own dainty fingers had knit. The stars twinkled brightly in the cold sky, and your heart beat almost as loudly as the thumping of your own feet and hers upon the ground. At the door of her own home you lingered for a last shy good-night, with one of her mittened hands in yours and the other on the door knob, and just before she turned the knob you— But the moon setting in the west casts a deep shadow there, too deep for us to penetrate.

Haven't we lost a little something really worth while in life if we think we have gotten too big or too rich or too old or too dignified for such fun-making as this? Don't make the mistake, my friends, of getting too far away from the simple life and the harmless, even childish pleasures. We may not all ride in automobiles, we may not all have pianos which play themselves, we may not all know the heroes and the heroines of the moving picture world, but can't we all, if only we will, enjoy such pleasures as those which made time turn backward for the country editor whose words I have quoted you here?

R. F. D. TROUBLES INCREASE.

I DO NOT want to be accused of saying "I told you so" in an offensive manner, but I cannot refrain from reprinting a newspaper dispatch from a county-seat town here in the grain belt telling of R. F. D. troubles during the recent heavy snowfall and cold snap. I am going to omit all names so as not to embarrass any of the people mentioned or unduly advertise the troubles of any community. Here is the dispatch:

Patrons of rural routes out of —— got no mail for five days because the three rural route carriers "struck" when the blizzard, with its snow and twenty below temperature, hit this section last Wednesday. The carriers said they could not and would not make the trips over their long routes in such weather. Overtures made by Postmaster —— had no effect on the carriers' decision.

Not until Monday was the postmaster able to reach a solution of the difficulty. Then he hired three teams and drivers to make trips over the routes every other day.

The mail has hitherto been delivered in automobiles. Changes made by the postoffice department last fall lengthened the routes appreciably and made the task of delivering mail in such temperatures as prevailed last week a formidable one.

You will recall that I have discussed this matter of the new policy of the postoffice department in regard to rural routes often of late. I predicted that the plan of combining routes until one carrier was expected to cover fifty miles a day, the year around, was doomed to failure, inasmuch as our roads are in no condition on stormy winter days for such a feat. I have ample proof of what I have been arguing in this newspaper dispatch printed herewith. Other and more convincing proof will be forthcoming when the spring comes and our roads are a morass through which neither automobile nor team can flounder for fifty miles, day after day.

Far better that our R. F. D. system had been left as it was, that new routes had been established of the standard length and that everything possible had been done to improve the service as it existed. The postoffice department has accomplished nothing but to make carriers and patrons dissatisfied and to make inefficient a service which was rapidly approaching perfection and which was proving a splendid factor in improving country life conditions generally.

The Wisconsin Farmer as a Cream Producer.

IF THE loss in dollars and cents to the farmers of Wisconsin who are delivering thin cream to their creameries could be accurately determined we believe there would be such an awakening that not a can of cream under 30 per cent of fat could be located at a single creamery in the state. Whenever a farmer sends a can of cream which is low in percentage to his creamery he is giving away a certain quantity of skim milk that is valuable to him for feeding purposes; he is increasing the cost of operating the factory; increasing the loss of fat in the buttermilk and lowering the standard of butter to be manufactured, the quality of which is the factor that governs the price.

Thin cream is, no doubt, costing our farmer dairymen hundreds of thousands of dollars annually. There are no statistics available on which to make an accurate estimate or even an accurate guess, but we believe that were the actual loss known it would astonish and probably startle our dairymen, and the result would undoubtedly be a campaign that would lead to the delivery of nothing but cream testing in the neighborhood of 30 per cent or better.

Statistics gathered recently by Mr. C. E. Lee, dairy specialist of the state food and dairy commission, caused him to estimate that the patrons of the co-operative creamery at Tomah are losing $10,000 annually by the delivery of thin cream. That is an average loss of about $25 a year to every patron of that great creamery. That $25 might just as well have been retained by the farmer by keeping the milk he let go to the creamery in his cream. The skim milk he lost, Mr. Lee figured, was worth that much to the farmer for feeding purposes. If a single community is losing $10,000 a year the loss, if the state were taken as a whole, certainly would be an eye-opener to the man who continued to deliver thin cream.

Mr. Lee, who recently addressed the Tomah dairymen, told them that last year they gave away 566,000 pounds of skim milk by taking cream to the Tomah creamery that averaged 23.3 per cent for the year. Had this cream averaged 30 per cent (and every farmer can produce cream of that kind) the farmers would not only have kept this 566,000 pounds of skim milk on the farms but they would have saved the cost of hauling; would have cut down the loss of fat in the buttermilk; would have cut down the cost of operating the factory, which is co-operative; would have lessened the cost of disposing of the buttermilk and would have increased the quality of the butter. Mr. Lee also pointed out that it would take 100 average cows and the services of ten men to milk them 365 days in a year to produce this 566,000 pounds of skim milk which ought to have remained on the farms but which went to the creamery in thin cream.

Corn is now retailing for 90 cents a bushel at Tomah, and, as the value of 100 pounds of skim milk is estimated for feeding purposes to be half as much as a bushel of corn it is seen that the value of this skim milk which was lost to the farmer was about $2,500. During the first fifteen days of August the Tomah creamery received 34,575 pounds of skim milk, which at that time was worth 30 cents a hundred. That is, the 27,921 pounds of butter fat could have been delivered in 84,619 pounds of cream instead of 119,194 pounds, and all can realize that had such been done the cost of handling would have been reduced.

We are citing the experience at Tomah to point out the loss to the farmer who delivers thin cream. The same condition is to be found at every creamery in Wisconsin and at every creamery in every other state. No farmer can afford to waste his skim milk in this manner. It is useful to him for feeding purposes. Even if not of use to him he should consider the increased cost of hauling, of operation of the factory, etc. Every farmer should skim cream that will test between 30 and 40 per cent, and a great loss, such as cited at Tomah, will turn to increased profits from the dairy.

Co-operation Between Business Men and Farmers.

THE community idea or rather the plan to bring the farmer and the business man into closer co-operation is gaining rapidly in favor throughout the state, and certainly is to be encouraged. In those communities where you find the farmer and the merchant touching elbows and breaking bread together you find the spirit that is building up those communities for co-operative effort always winning. Where the farmers pull one way and the business men the other little progress, as a rule, is found, for the success of every merchant is dependent largely upon the success of the farmers in his territory, and when the merchant does something to further the farmer's progress he is indirectly aiding himself.

The spirit is being fostered in many sections of the state this winter and other cities and villages are rapidly falling into line. Granton, in Wood county, has seen the advantage of this community intercourse and the business men there have rented a hall at an expense of $400 a year so as to afford the farmers who come there to trade some of the joys of city life and let them know that they are welcome. A picture show has been started in the hall by the merchants and the plan is to put on a show every Tuesday and Friday nights at which a small fee, merely covering operating expenses, will be charged, and on Saturday afternoon, when most of the farmers and their families come to Granton, give a free moving picture matinee to all. Vesper is another thriving little village in that part of the state which has joined in the community idea, and the merchants there have provided a free rest room for the farmers, their wives and their children. Here they may sit in comfort, meet their friends, etc. Business men at Vesper say that a test of the rest room project has proven it to be a paying investment, as the farmers like to trade in a city which is looking after their interest, which appreciates their trade and is willing to go a little out of the beaten path to accommodate them. Janesville in Rock county has a commercial club which is also fostering this spirit and the club only recently moved its quarters from the top floor of an office building to a ground floor room in the business district so that the club rooms would be more accessible to all. This arrangement makes it easy for the farmers and their families to drop in and get acquainted, meet there to compare notes, meet their friends, etc. The room is spacious, provided with big, easy chairs and the club is pleased to have the farmers make that their headquarters while in the city. Then the rooms are large enough for holding grain shows and like expositions.

The Wisconsin Farmer would like to see this idea spread into every city and village in the state, for experience has proven the investment by the business men worth while. Nothing wins like co-operation, especially between the business men and those they must depend upon—the farmers.

President Brett, of Elkhorn Fair, Retires.

FOR many years the Elkhorn fair, held under the auspices of the Walworth County Agricultural Society, has been held up as a model county exposition. The Elkhorn fair, we venture to say, is as well known in Wisconsin as the state fair. It is also known in other states, and its visitors and exhibitors come from other states. In 1914 it had a larger attendance than any fair in the state except the state fair with the Dodge County Fair at Beaver Dam a close second. Last fall, despite the fact that the state officials called off the cloven-hoof live stock show, the fair entertained enormous crowds, all of which has often occasioned the remark in the writer's presence, "Why is the Elkhorn fair so successful?"

The Elkhorn fair was first held in 1854, and during the past two generations has not asked for money, as a great many county fairs are compelled to do. Free water and light during fair week has been the concession asked of Elkhorn, and it is not to be wondered at that so many fair officials look to Elkhorn as a model. Some are succeeding; some failing.

Mr. James E. Brett, who has just retired from official connection with the fair after sixteen years as treasurer, one as vice president and one year as president, points out in a farewell speech to the society some of the reasons for the success of the fair, and we believe he puts advertising above everything else. Certainly the Elkhorn fair has been well advertised, not only in the press but in many other ways, and Mr. Brett, in answering criticisms as to why so much is spent for advertising, replied that the years which showed the heaviest advertising expense also showed the biggest gate receipts. The tendency was for the visitors to come back, and the Elkhorn fair makes its visitors boosters. For years it has conducted the fair on clean, moral lines; the glad hand has always been out to the visitor and the newspaper man; the fair has given what it advertised and the result is that the advertising by visitors is now a wonderful asset. No matter how fine exhibits may be no fair can succeed without crowds, and advertising brings them.

Mr. Brett tells of the scores of fair officials who have come to Elkhorn to learn how Elkhorn made its fair succeed. The trouble with many fair promoters is that they wish to start at the top of the ladder, while Elkhorn began at the bottom. The fair there started fifty-nine years ago with six acres of land, no buildings and the society owing for the land. It has taken almost sixty years to get where the fair is today, and Mr. Brett, who saw the first fair in 1854 with boyish glee, has been closely connected with its struggles during these six decades. Good exhibits good management and a real show will make any fair, and Mr. Brett believes advertising will get the crowds. The Elkhorn fair loses in Mr. Brett a splendid official, but declining health made it impossible for him to continue at the wheel. Already the trumpets for the 1916 fair are sounding and the Elkhorn officials promise bigger things than ever.

Wisconsin Live Stock Men to Meet.

FIFTEEN state live stock associations, representing most of the prominent breeds, will hold meetings in Madison the week of February 7th to 12th. It is probable that the largest gathering of breeders ever held in the state will occur at that time. It affords a wonderful opportunity for live stock men to get acquainted and to listen to splendid addresses by men of knowledge and experience. Stock men will find it to their advantage to be in Madison the entire week. If, however, they are unable to take this much time, Thursday and Friday, February 10th and 11th, are the main days and should not be missed. Separate meetings will be held by each one of the fifteen state associations. On Thursday, February 10th, there will be a general live stock meeting in the auditorium of the College of Agriculture. Mr. John M. Evvard, of the Iowa State College of Agriculture, will speak on economic pork production. Mr. Evvard has some splendid accomplishments to his credit and lately has added new laurels with his self-feeding experiments. Mr. James E. Poole, of the Union Stockyards, at Chicago, will speak at 1:30 p. m., the same day on "Wisconsin Live Stock at the Yards." In the evening there will be an address by Dean David S. White, of the Veterinary College, Ohio State University.

The associations which will have their annual meeting at Madison either Thursday or Friday of the week above referred to, and the officers of each association are as follows:

1. Wisconsin Aberdeen Angus Breeders' Association—President, Park Gelbach, Lancaster; secretary, Wm. A. Connell, Menomonee Falls.
2. Wisconsin Short-horn Breeders' Association—President, E. E. Jones, Rockland; secretary, John L. Tormey, Madison.
3. Wisconsin Red Polled Cattle Club—President, J. B. Ahlers, West Bend; secretary, L. C. Underwood, Avoca.
4. Western Guernsey Breeders' Association—President, F. E. Fox, Waukesha; secretary, Charles L. Hill, Rosendale.
5. Wisconsin Holstein-Friesian Breeders' Association—President, W. J. Gillette, Rosendale; secretary, Chris Schroeder, Racine.
6. Wisconsin Horse Breeders' Association—President, W. K. Caldwell, Morrisonville; secretary, J. G. Fuller, Madison.
7. Wisconsin Sheep Breeders' Association—President, Arthur Broughton, Albany; secretary, Gavin McKerrow, Pewaukee.
8. Wisconsin Berkshire Breeders' Association—President, H. C. Taylor, Orfordville; secretary, J. H. Kitchin, Eldorado.
9. Wisconsin Duroc Jersey Breeders' Association—President, M. H. O'Keefe, Waunakee; secretary, John D. Gant, Delavan.
10. Wisconsin Poland China Breeders' Association—President, M. Madson, Madison; secretary, E. E. Jones, Rockland.
11. Wisconsin Chester White Breeders' Association—President, James Fisher, Eastman; secretary, A. H. Kuhlman, Madison.
12. Wisconsin Ayrshire Breeders' Association—President, A. J. McNab, Black River Falls; secretary, Frank T. Stare, Ladysmith.
13. Wisconsin Hereford Breeders' Association—President, G. A. Porter, 3111 West Madison, Chicago; secretary, C. W. Thompson, Lake Geneva.
14. Wisconsin Jersey Breeders' Association—President, Ed Bruin, Fairwater; secretary, E. E. Wyatt, Tomah.
15. Wisconsin Live Stock Breeders' Association—President, Stephen Baird, Waukesha; secretary, A. W. Hopkins, Madison.

With so many good things promised by the speakers and the drawing together of the members of fifteen different breeders' associations it doesn't seem possible that any farmer or breeder who can possibly attend will remain at home.

Institutes For Wisconsin Farm Boys.

STUDY and thought are necessary to be successful in farming these days, and The Wisconsin Farmer is pleased to see the interest being taken this winter by the boys in the short courses which are being held for their benefit in different parts of the state. These boys are preparing themselves for the future, and the lad who wants to get ahead cannot afford to spend his spare time whittling pine sticks or reading blood-and-thunder novels. He must make the best of his opportunities, and the short course for the farm boy is an opportunity to build for the future. Much good is being accomplished by these short courses and every farm boy who lives within riding distance of one should attend. As a striking example of the value of these short courses the writer had the pleasure last summer to visit with a young man

in Douglas county whose interest in a short course conducted at Poplar by Mr. J. M. Walz, county agricultural representative, led to the erection of a silo and an improvement in the barn on his farm. This farm boy rode eight miles through the snow and over bad roads when the temperature was as much as twenty-five degrees below zero to attend the course. Certainly there can be no excuse for a boy living within easy access of such a short course to stay away. These courses consist of two winter terms of several weeks with the intervening time spent in some home project work under direct supervision of the instructor who is usually the county agricultural agent.

Farm mechanics, soils, horticulture, breeds of live stock, studies in grain and weed seeds, and farm business practice are among the subjects taught. As far as announced, courses are being held this year as follows:

Polk county, Frederic, November 29-January 21st, in charge of J. S. Klinka; Douglas county, Lake Nebagamon, dates not given, in charge of J. M. Walz; Eau Claire county, Eau Claire, January 31st-March 24th, G. R. Ingalls; Taylor county, Medford, January 24th-March 31st, R. A. Kolb; Price county, two weeks course at Ogema, beginning January 10th, in charge of Griffith Richards.

Panama-Pacific Exhibit Brought Home.

THE live stock pavilion at the college of agriculture at Madison will be filled with Wisconsin products during farmers' week in February and should be the Mecca for thousands of our farmers. The Badger exhibit at the Panama-Pacific Exposition, 120 feet long, will stretch along the south side, opposite the entrance, and serve as the background for the grain, dairy products, dairy machinery, etc., which will be shown there. Mrs. Addie F. Howie, who was in charge of the Wisconsin exhibit at San Francisco, brings back the news that this exhibit attracted more attention than any other and it is being set up in the live stock pavilion now so that residents who did not get to see it there can see it here. In front of this exhibit will be the grain exhibited at the annual grain show of the experiment association, the displays representing twenty-five years of dairy progress, etc. The pavilion will be filled and will be interesting to everyone. Mrs. Howie, on her return, announced that the Wisconsin exhibit at the Panama-Pacific Exposition won twenty-eight gold medals, forty-one silver medals and twenty-seven bronze medals and that the showing of Oderbrucker barley, the product of sixteen years of careful breeding, won against the showing of every country where barley is grown.

Federal Legislation Needed to Improve Farm Conditions.

ASSISTANT SECRETARY OF AGRICULTURE CARL VROOMAN has been a popular speaker at various agricultural conventions in the grain belt during the winter. Mr. Vrooman farms a large body of land and he is, therefore, familiar with all the complicated problems which farmers have to deal with.

In a recent address he called attention to the fact that most men farm primarily for profit, not to demonstrate principles of agronomy. They produce crops in order to support themselves and their families; they do not live and rear families in order to produce crops. What they want is not only large production but profitable production. For years maximum yield per acre has been held up as the goal towards which we must strive; agronomy has been preached as the beginning and end of agricultural science; the salvation of the American farmer has been hitched, as close as words could hitch it, to bumper crops.

Figures were presented by Mr. Vrooman showing that there have been a number of years in which a large crop meant a small income, in which the farmer not only received less per bushel for his corn and wheat than in unfavorable years, but less for the total crop. In 1912, for example, the country produced 677,758,000 more bushels of corn than in 1913; the farmers got $171,638,000 less for their corn in 1912 than they did in 1913. In 1906 a wheat crop 101,174,000 bushels larger than that of 1907 brought $64,104,000 less. In 1906 the corn crop, too, was unusually large, more than 150,000,000 bushels larger than in 1909; but it brought the farmers $500,000,000 less.

Farming is a business as much as running a steel plant, a saw mill or a bank, and Mr. Vrooman pointed out that a successful business man expects to make interest on his investment, wages for his time and a profit besides.

Unfortunately few farmers attain this ambition. Too many American farmers today are merely giving themselves hired men's jobs. Their labor incomes, the incomes that are left after interest on the capital has been deducted, frequently are no more than fair wages and sometimes less.

Mr. Vrooman alluded to the fact that in neither a day, nor a year, nor a decade can we hope to persuade all or even a majority of American farmers to farm efficiently enough to run the slightest risk of swamping the market. In the meantime, progressives among the farming class will reap rich rewards.

Another reason is that while a considerable number of intelligent, wide-awake farmers are steadily increasing their yields, as well as their profits, by scientific agriculture and business methods, probably a large number of our farmers are reversing the process by careless and short-sighted farm methods, which diminish the productivity of the soil and reduce yields.

Improved Types of Animals a Necessity.

IT IS OF GREAT importance to every farmer who in any way uses live stock in his system of farming to have improved types of animals. Such animals better meet some of the wants of man than the common stock of the country. Whether a single animal or family or breed is improved so far as the farmer is concerned, depends on what the requirements are. The first question in selecting stock is: What are they wanted for?

In these days of close competition and high-priced animal foods, farmers must have animals that possess the highest possible development for one special purpose, that is, the highest possible development that can be attained without weakening their vital functions. In some cases animals are kept for more than one purpose. Such animals cannot be highly developed in both directions, but may be symmetrically developed in two or more natural functions. It is a serious mistake to multiply the difficulties of breeding by attempting to breed animals that excel in more than one line of production.

The special dairy farmer need not be troubled by the fact that other farmers, in selecting cattle for breeding, look almost exclusively to indications of special adaptability for beef production, while a much greater number wisely say they find their wants best met by the cattle which have had their natural capabilities for both beef and milk giving cultivated to equal degrees. The great mass of dairy farmers will do well to select and breed for the highest possible development of the milk-giving functions without impairing health and vigor.

In selecting animals individual merit is of first importance. If this inherited excellence is present the value of the animal as a breeder is greatly increased. Pedigree is valuable because it is the safest guide in determining the qualities of the ancestors. Pedigree is not always proof of individual merit, but a first-class animal is a living witness of a good pedigree.

Environment, heredity and conditions of life cause a wide variation in the type of farm animals. The possibilities of animal development depend upon what it has inherited from its ancestors. The extent to which this development may go will be determined by the conditions that surround it. The breeding and developing of improved types of live stock need not necessarily be a matter of chance, as many seem to think, but a matter of accurate and well-defined knowledge. Years ago a few far-seeing men saw the need of animals that would convert their food into animal products in paying quantities. They began the selection of animals of the desired quality. In the course of time they developed meat-producing animals with strong backs and well-sprung ribs, well-developed in the quarters, well let down in the flanks, with a soft, mellow hide, straight top and bottom lines, and a tendency to locate as much as possible of their flesh on parts that command the most money in the markets. This line of breeding has been pursued until the animals possessed the true meat-making form. They are able to reproduce this form with certainty, because they have acquired the fixed habit of economically converting their food into the higher-priced cuts of meat. In the same way breeders of dairy cattle, horses and poultry have been able to develop better types and breeds, each breed or variety developed for some special or particular purpose, and with the inherited tendency of doing their best work in their particular line.

Why should the average farmer be interested in keeping high-class stock? Because he grows crops on his farm which he desires to convert into money. He may sell his crops or feed them to animals on his farm. If he sells his crops he expects the highest price, and in this kind of a deal he is characterized as a sharp business man. But, in case he desires to feed out his crops on his farm, he frequently exercises anything but sound judgment and selects animals for the purpose of converting his crops into money which are not capable of returning a fair profit for his crops. Instead of well-improved animals that have been bred and perfected by years of experience for the purpose of making some particular product most economically and profitably, he selects animals regardless of age, type or capacity. It is astonishing that so many persist in feeding crops to unimproved stock that cannot manufacture sufficient products from the food consumed to pay for their keep.

Compulsory Exercise For the Brood Sow.

IT WOULD be difficult to point out a lazier creature in the animal kingdom than a brood sow, and those who proclaim the doctrine of letting Nature take her course will face all kinds of dire disaster in swine breeding operations if they let the sows have their own way. We do not hesitate to say that the most skillful kind of feeding involving an ideal balanced ration will not result in a favorable outcome at farrowing time unless some sort of compulsory exercise is forced upon the breeding herd.

We appreciate the fact that a subject like this becomes hackneyed and it is difficult to convince the average man that much importance should be attached to exercise during the winter months. When sows have their own sweet way about the matter they spend four or five hours nestling in their nice warm beds for every hour that they rustle, whereas during the greater portion of the winter there is no reason why the animals in the breeding herd should not be kept on their feet during the greater portion of the day.

One way to enforce part of this discipline is to scatter grain about the yard instead of feeding it in a trough. This is not enough, however, and those who are most successful in raising large, strong litters have almost universally adopted the plan of turning their sows away from the yards during the greater portion of every fine winter day. If there is no straw available and they do not have access to a manure pile, the sows of necessity keep themselves on the go continuously. It is ideal if they can spend this time in a big pasture, because in that case they will keep roving over it instead of standing at the gate and squealing, which will be the case if they are simply turned into a bare yard.

It will pay to take the time to scatter a little shelled corn here and there over the pasture. This will prove an incentive for the sows to be continuously on the hunt for food.

Another good plan is to feed from a crib or granary located at a considerable distance from the herd's sleeping quarters. If a little corn is thrown out once a day from this crib the sows will not only make the trip for that one meal, but they will, in all probability, cover the distance three or four times, and these journeyings backward and forward force them into a life of activity that will contribute more than any other one factor to a strong, healthy litter. Even the old, heavy sows that are inclined to be too fat will cover two or three miles a day at least, if some such system as we have referred to in feeding is followed.

There may be times, to be sure, when stormy weather will prevent carrying out this program rigidly. Hogs are not very well protected against cold and the matter of exposure should not be overdone during severe weather. However, the daily labor program may be carried out four out of every five weeks during the winter and it should be kept up until each individual sow is placed by herself two or three days in advance of her farrowing period.

Neighbors Join in Purchase of Lime.

IN THE following communication an Illinois subscriber outlines a few preliminary steps that are taken by himself and his neighbors preparatory to the establishment of meadows. He writes:

We usually begin working and planning for the coming hay crop in the dead of winter. We can give the time to this better now than we can later in the season, when other work presses. Our first work is to get what lime we are planning to use and have it slacking for spring using. As we have to haul it some eight or nine miles, we can draw a heavier load on sleds than on wagons, which saves some time and horse flesh.

The lime we use is shipped in in bulk. A number of the farmers of the neighborhood usually put together and take a carload, so economizing a little. When the car gets in, we start the teams for the station and empty it before we have any charges to pay. The lime is put out in a big heap and permitted to stay there till spring, and by the time we want to use it is in good shape for sowing. It is the custom on my farm to use the lime with some crop, say oats, and so get the benefit of it, not only this present season, but next year in the hay we cut as well.

Another thing we have been doing for years in the direction of better meadows is to get the best possible seed. There is some difference of opinion here among some of us. There are those who think it more economical to buy timothy seed that has been hulled in the process of cleaning and recleaning. These farmers say they believe this seed is just as sure to come as that which has not been thus robbed of its outer coating; and I must say that I do not know how true this is, for I never have used any of it; but it is not nature's way of seeding, and the more closely we follow her, it seems to me, the better we will be off; so I have always bought the very best seed I could find, and consider that I am economizing by so doing.

And when I invest in this seed, I have an understanding that it shall stand the test of analysis at the state experiment station. I send away a sample of the timothy and also of the clover seed I propose to sow, and if it does not prove to be pure, I reserve the right of taking it back to the dealer. I had the fortune one year to get some alfalfa seed that was heavily loaded with foul seed. The man I got it of told me when I bought it that he would stand back of it. When the state report came I took it to the dealer. He was surprised enough, saying that he had supposed he could rely on the house of which he purchased it. But he stood by his word and gave me my money back, and I went elsewhere for my seed. It is not a pleasant experience, but it is better than to sow foul seed. In order to be sure that we will have time to secure an analysis of our seed, we buy it early. It may be done any time now.

On general principles it is sound policy to know something of the germination ability of seed before sowing it and more and more farmers are relying on the germination test that they are able to obtain through their experiment stations.

Where land is strongly acid, which condition is usually indicated by the fact that meadows are not thrifty, there is unquestionably some advantage to be obtained from applying lime, and the suggestion here given in regard to neighbors combining so that lime can be purchased in carload lots is one that will apply to many communities. This holds true especially in localities where a number of farmers are preparing to sow alfalfa, because this is a crop that makes but a half-hearted growth on acid soils.

Encouraging The Pure Breds.

Testimg in the Stanley Country Increases Interest in Better Stock and Also in Prover Feeding Rations.

[Editor's Note.—The following is from the pen of Richard F. Adams, official tester for the Stanley Co-operative Cow-Testing Association.]

Much has been said in favor of cow testing so far as it concerns the improvement of milk production, but it is just as valuable in getting farmers into pure-bred dairying as it is in inducing them to dispose of their boarders and feed more liberally and properly those that do pay for themselves.

OLE KROGAN FARMHOUSE, DAIRY BARN AND SILO, STANLEY, WIS.

No better illustration of the value of association testing is available than that at Stanley, Chippewa county, where Ole Krogan, of Stanley, has launched into the pure-bred business. Three years ago Mr. Krogan joined a cow-testing association. Finding that he had too many head of stock to feed he thinned out the poorest and fed the rest better than previously. He kept thinning out the poorest producers in his herd and feeding still better, with better results in milk production, with the result that he soon had a herd which was giving a good account of itself. Up to that time he had only grades, and the improvement he had made in his herd caused him to take an interest in pure-bred stock and shortly afterwards he bought two pure-bred Guernsey heifers which both had heifer calves. The result was that he had the start for a nice pure-bred Guernsey herd, and all due to adopting the businesslike system of dairying.

Mr. Krogan's pure-bred cows were tested in the Stanley Co-operative Cow-Testing Association the past year and found to be good producers, and Mr. Krogan is well satisfied with his start for better dairy individuals. A pure-bred Guernsey sire heads his herd and consequently a new grade herd is also started.

This is only one result of the work of the Stanley Association which is doing much toward building up the dairy herds in that community. The experience of Mr. Krogan and others in that association, shows what joining a cow-testing association will do for a dairyman. It pushes guesswork aside and puts the dairyman on a business basis. He keeps the cows which respond well to a balanced ration and soon parts company with Mrs. Boarder and Mrs. Poorproducer. And what is more, he has his mind made up to start working into pure breds as fast as possible and get something that may be depended upon to produce as well or better than their ancestors. So Mrs. Scrub must soon be sold to the man who slides along the old "good enough way" and stays in the same old rut. We want men in the dairy business in Wisconsin who believe in improvement, so when an attempt is made to help them they are ready to take advantage of the opportunity.

REGISTERED GUERNSEY, DEW DROP'S LAD, OWNED BY OLE KROGAN.

Personally, I believe an inspector should visit many dairy farms in the state. This visit should be made to suggest better methods for the production of cleaner and healthier stock and milk that would not be a menace to the public health. I believe milk should be bought by grade and a premium price put on the cleanest milk. This leaving it to cheesemakers and buttermakers to send home milk or cream that is really too dirty to be made into cheese or butter is really imposing upon them the duty of the government. Many cheesemakers and buttermakers are tempted to take dirty milk so as not to offend their patrons, hence a grade of butter or cheese is made that is not up to the grade that could have been made if the best milk or cream had been brought to the factory. Is this right? Who suffers? In this case it is the man who does his best and not the one who does his worst. It has been my experience that in some cases patrons in some of the associations I have had were very anxious to clean up when I came and the real beauty of it was they tried to stay clean, for they did not always know the day I would come. This habit grew until it staid by them. Today, clean, well-fed, well-housed and well-bred herds give these people the satisfaction that they are doing their best, and thus contentment follows. A very small proportion of the dairymen of this state have clean, sweet-smelling barns and produce clean milk, so if we wish to compete with foreign high-quality products we would be wise to have a law which in effect would give all dairymen notice to clean up and keep clean or pull out of the business. In this way the clean man will get what is his due. The way to do this is to have a government inspector for each county, whose duty it would be to visit each dairy barn two or more times each year.

Ask the King Board of Experts

For the Plan of Ventilation Your Barn Needs

YOU want the skilled service that goes with a King System of ventilation. Like a heating plant, no ventilating system is better than its plan. And to know how to design the *right* plan takes years of experience.

Take advantage of experience back of the King Board of Experts. Write us and let us outline this personal service that goes with a

KING

System of Ventilation

Planned Individually for the Building It Goes Into

You can install King System in any barn, new or old. The King Aerators, which set on the roof, are the first part of the King System; you can have them with or without a complete system. If you are not ready for the complete system right now, at least put King Aerators on your barn and in the meantime ventilate the hay mow or upper part of the barn and add beauty to the building.

Send for These Books

One is our catalog, which is free. The other is Prof. King's Book on Ventilation (sold heretofore for 75c) mailed for 10c to cover postage and packing.

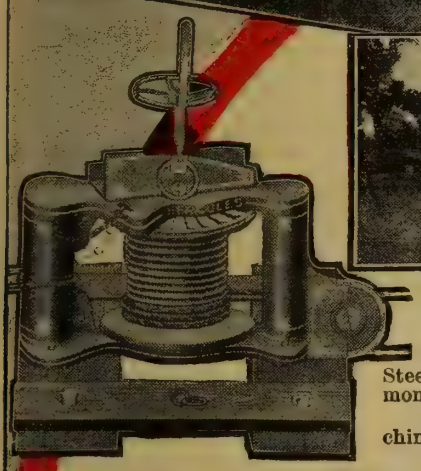
Pull Out Every Stump This Year

Write For My Great Book and Low Prices Now

Mail the Coupon!



Make this your banner profit year! Farm *all* your land. Pull out the stumps—plant on virgin soil and reap the reward of *increased land value and big crops that you won't get if you let the stumps stand!*

Get my new free book at once, explaining all the facts and figures about the Hercules All-Steel Triple Power Stump Puller—the machine that so many thousands of farmers are making big money with throughout the country.

Let me tell you how you can easily make $100.00 profit for every $1.00 invested in the Hercules machine, not only the first year, but for years and years to come.

HERCULES

All-Steel Triple Power Stump Puller

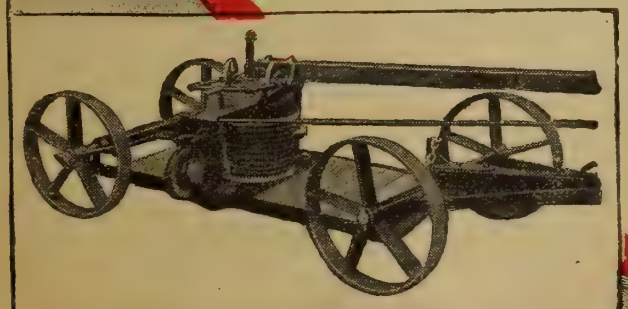
With a Hercules, you turn your loafer stump land into *money* land and harvest *money crops*. The work is easy, quick, safe and *sure*. The Hercules pulls out the *roots and all*—no grubbing or plowing into snags.

Pulls An Acre of Stumps A Day

Let me send you my free book that shows what *other* progressive farmers have done and are doing. Read where they pull the biggest stump in five minutes, clearing an acre of stumps a day. See the actual photographic illustrations of scenes from many states. Read about Hercules.

Construction

The Hercules is the *one* all steel, triple power stump puller made. It will pull any stump, green tree or hedge without straining or breaking. It is 60% lighter, and 400% stronger than any "semi-steel" or cast iron puller made. Don't be fooled on names that sound like *genuine* steel. Get a Hercules and be *sure*. It's the only puller with double safety ratchets—has self-anchoring and stump-anchoring features and is built low to the ground.



My 3-Year Guarantee

If any casting of your Hercules All-Steel, Triple Power Stump Puller breaks, any time within three years, Whether the Fault is Yours or the Machine's, I will absolutely replace any such part free of all cost to you. There are no conditions to this guarantee whatever. Any casting will be replaced promptly, whether the machine breaks by accident or through any flaw in workmanship or material.

My New Low Prices Beat All

To the first buyer in each locality I am making a special price offer this year that is bound to gain the attention and get hundreds and hundreds of orders from farmers everywhere. I want you to get in on this bargain at once. The limited number of these machines won't last long at the price I am making. If you write me at once on the coupon below or on a postal I will reserve one of these machines until I hear from you whether or not you are going to buy. Understand, your request for my book is not an order. I simply want to get the book to you at once, so you can read the remarkable facts about the Hercules All-Steel, Triple power Stump Puller and how it does such splendid work, making big profits for owners everywhere. Also **Hand-Power Stump Puller Pulls 120 000 lbs. Low Price. The ideal machine for the man who has no horses. Ask us about it.**

Mail Coupon

or a postal right now before you forget, or take down the name and address and write as soon as you get a minute's time. Address me personally.

HERCULES PORTABLE ONE-MAN PULLER FOR USE WITHOUT TEAM

THE only portable one-man puller on the market. One man can develop a pull of 120,000 pounds on the stump. When stumps are out a 14-year old boy can move puller. No heavy lugging or dragging

The Hercules Portable excels all other hand machines, because it is so light, strong and easy to handle. It develops more power with 6-ft. lever than any other machine with 10-ft. lever. The ideal machine for the man who has no horses. Write for particulars.

Pullman $740

The Great Big Car For the Farm

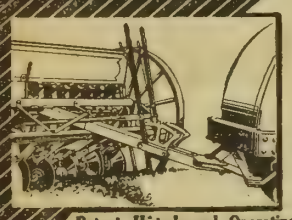
PULLMAN Cars are making money for the farmer in all sections of the country. Their durability and economy in maintenance increase your power of attending to your business in less time and at less cost. The *Pullman* is a great big car for a small cost. You receive a stupendous value for your money. The lines of the car are distinctive and attractive. There is exceptional spaciousness in the tonneau and driving seat—plenty of leg-room, hence ample comfort. The mechanical construction is good—few parts, therefore less trouble.

Pullman Cars ride smoothly and easily. Decrease your cost—increase your profits.

Pullman Motor Car Co.
DEPT. 5 York, Pa.

Cover the Seed For Big Crops

Here's the *big profit* maker for the man who grows grain of any kind. It's the drill that *opens* the furrow and *drops the seed at the* BOTTOM. No seed wasted—none lost to birds or wind. It's all *covered* in the bottom of a *packed seed bed.* Makes a top notcher of *every* crop.



The Peoria Disc Shoe Drill

Disc cuts the trash and hard ground; force feed—sows all kinds of grain including flax. Cannot injure seed. Drop frame with disc drawbars attached direct to front—strong, simple construction. Pays for itself quickly in time and work saved and bigger crops.

Patent Hitch and Operating Levers for Tractors—Make a quick, strong hitch to tractor of *any* kind—operate levers *without leaving tractor platform.* Attach without interfering with regular levers.

CURRENT EVENTS

PRESIDENT WILSON is planning on making a tour of the grain belt, speaking in defense of national preparedness. His itinerary has not been completed, but it is expected that he will deliver addresses in Des Moines, Sioux City, Chicago, Cincinnati, Cleveland and Toledo. The president has become convinced that there is strong opposition to his preparedness plan in the middle West and is hopeful that his speaking tour may overcome part of this. He has changed his winter's social plans and proposes to devote almost all his time to this question of enlarging the army and the navy. He is firmly convinced that the program prepared by Secretary Garrison, of the war department (which calls for an enlargement of the regular army and the militia and the formation of a continental army of 300,000 men to serve three months each year), and by Secretary Daniels, of the navy department (which calls for the addition of more dreadnaughts to the navy than have ever been built in one year before), is the best which can be offered at this time. In championing this he aligns himself squarely opposite to Wm. J. Bryan and other pacificists. The prospects are for a political fight of the first magnitude, inasmuch as the democratic party is now split as badly as the republican party was four years ago, when Taft and Roosevelt confronted each other.

MONTENEGRO is the first of the European countries which has been fighting continuously since August 1, 1914, to sue for peace. Beset on the north, east and west by Austro-Hungarian armies, with all lines of retreat cut off except into Albania, where hostile tribesmen were to be faced, Montenegro asked Austria-Hungary for peace and her request was granted. Unconditional laying down of arms by Montenegro was made the basis of the opening of peace negotiations and these terms were accepted by the badly beaten people of the little kingdom. It had been conceded for days that the situation of Montenegro was a critical one. Although the army of the little kingdom fought valiantly against the Austro-Hungarians, it was unequal, because of inferior forces, lack of guns, and, it has been stated, a shortage in commissariat supplies, to the task of holding back the armies that had, in conjunction with their allies, succeeded in crushing Serbia. Already the Montenegrin capital and many of its important towns had fallen into the hands of the Austro-Hungarians, and the invaders were well on their way to Montenegro's chief seaport—Antivari. Montenegro is one of the smallest of the Balkan states, having an area of only 3,600 square miles, with a population of 250,000, almost entirely of Servian descent. The Montenegrin army consists of from 30,000 to 50,000 men and did valiant service in the Balkan wars. In fact, since it won its independence from Turkey over 400 years ago Montenegro has never bowed the knee to any foreign power until it was crushed by the Teutonic allies.

INTERVENTION in Mexico as a result of the troubled conditions there and the assassination of eighteen Americans a fortnight ago is persistently demanded by a number of leaders in congress. President Wilson and Secretary Lansing are determined, however, to give General Carranza ample time in which to bring the bandits, who assassinated the Americans, to trial and are persistently opposing the intervention attempts. General Carranza has already executed one of the chief bandits allied with Villa, his body having been exhibited at El Paso last week in order to prove that Carranza is doing what he can to better conditions and to bring the guilty to justice. Americans who have large investments in Mexico are the most persistent in demanding that the United States send troops across the line. Thus far the majority leaders in congress have succeeded in preventing action on any of the resolutions calling for intervention or investigation. Up to the first of this week no vote had been taken on any of the propositions, even the proposal of Senator Gore for the creation of a neutral zone in northern Mexico to be policed jointly by American and Mexican troops, and that of Senator Lewis to authorize President Wilson to use the armed forces of the nation in co-operation with Carranza troops, going over. Republican senators, however, expect to keep the issue before the senate and eventually may make an effort to get the question of intervention up for a vote.

FIVE members of the Ford peace party have been chosen as a permanent peace board to sit in Europe indefinitely, with the purpose of using all efforts to settle the war. The five are Wm. J. Bryan, Henry Ford, Jane Addams, Rev. Charles Aked and Mrs. Joseph Fels. Dr. Aked was pastor of the Baptist church which John D. Rockefeller attended for several years. Miss Addams is a noted sociological worker, head of the Hull House, of Chicago. Mrs. Fels is a noted philanthropist. The board is to be composed of an equal number of members from the various neutral countries and will remain in The Hague or Stockholm, with the financial backing of Mr. Ford. Each member will receive a salary, and the entire expenses of the board probably will amount to $50,000 yearly. Dr. Aked announced that he would offer his resignation from his San Francisco church. The other members of the Ford peace party have sailed for home, having spent several days at The Hague, where they were allowed to proceed, by the courtesy of Germany, traversing some German territory in the nighttime. Whether anything really definite and tangible has been accomplished by the trip is a debatable question. Public sentiment has been aroused and Mr. Ford claims to be satisfied. The expenses so far have been well on toward a half million dollars, but Mr. Ford is a many-time millionaire and doubtless feels he can easily afford so large a sum if any good whatever is accomplished.

GEN. VICTORIANA HUERTA, the Mexican dictator whose refusal to salute the Stars and Stripes at Tampico brought about American seizure of Vera Cruz and the attendant battle in which twenty American sailors and marines lost their lives, died last week at El Paso, Texas. Huerta left Mexico some months ago, flying to this country for refuge. Shortly thereafter he was arrested on the ground that he was attempting to promote another revolution while a guest in this country and just a few days before his death a grand jury indicted him on this charge. General Huerta seized the presidential chair in Mexico after the assassination of President Madero and his vice president, being generally held responsible for that foul deed. He ruled things with a high hand, but his trouble with the United States ultimately caused his downfall, as he could obtain no credit as long as this government refused to recognize him. His body has been placed in a vault, in the hopes that at some distant day peace may be restored in Mexico and the authorities will permit his body to be interred there, a request which General Carranza, now president, absolutely refuses.

MEXICO is infested with at least 100,000 cases of typhus fever, according to reports which have reached El Paso. American physicians armored in silk and rubber, are preparing to go into the afflicted country to combat the epidemic with the methods used lately with success, in Serbia. In the meantime, El Paso authorities are taking every precaution to keep the disease out of that city and Texas generally. Out of a population of 20,000 one Mexican town is said to have lost 1,980 by typhoid in December. The situation is extremely serious and adds to the troubles which are besetting Mexico on every hand these days.

Announcement of Louisiana's Land Opening

This announcement is appearing all over this country at the same time. We are determined to sell the lands described herein just as quickly as possible. If you want to own one of these farms then by all means send us the coupon below, together with your first remittance, today without fail. If you will not take our word as a guarantee, and you desire to know more about these lands before reserving a farm, then send the coupon for our literature below.

These Lands Described

These lands lie 690 miles south of Kansas City, on the Kansas City Southern Railroad, about sixty-five to seventy miles north of the Gulf of Mexico, in what is known as the Ozone Belt of Louisiana's Western Highlands. They lie from 130 to 185 feet above sea level, and are naturally well drained and free from any connection with alluvial meadows, drain swamps or land of similar kind. Too much cannot be said of the natural formation of this country.

Soil

The soil is a dark colored, sandy loam, underlaid by a rich clay subsoil. This soil is known as a very quick soil, as the sun warms it quickly, allowing seed to germinate rapidly. It is a natural soil, built by natural methods, and not deposited by overflows, etc.

Transportation

Beauregard and Vernon Parishes (Counties), in which Long-Belt Farms are located, enjoy unequaled transportation. The Kansas City Southern Railroad, Lake Charles & Northern Railroad, Louisiana & Pacific Railroad, Gulf, Colorado & Santa Fe Railroad, and several chartered railroads of lumber companies are available through both of these parishes. The Kansas City Southern Railroad gives an entrance into Port Arthur, where sea transportation can be had to all points of the world.

Schools

The school system of this locality is one of the most attractive points in its favor, being equal to any similar system in the North.

Roads

The roads in these two parishes are exceptionally well built, and a large amount of money, in the near future, is to be expended for additional highways.

Crops

It is our purpose to recommend general farming and live stock raising throughout this section. Louisiana's corn crop for the year just past is estimated at 48,000,000 bushels. This is a jump from 19,000,000 bushels in 1913, and shows how rapidly is Louisiana changing from a one-crop state to a diversified farming section. Here you may grow corn, oats, hay, the clovers, velvet beans, cow peas and other legumes, and with less competition than in almost any section of the North. We recommend Sudan grass growing, especially, for this section. Besides the staple crops, you can devote a few acres to trucking and can have about your home for additional profit such products as oranges, kumquats, figs, grapes, pecans, melons, ground fruit, etc. The staple crop of Louisiana, of course, is cotton, and most of our Northern farmers will want to have a crop of this great "mortgage lifter."

Live Stock, Poultry, Etc.

This section of Louisiana is well adapted to all kinds of live stock raising, cattle, sheep, hogs, and by the introduction of fancy stock for breeding purposes the native stock, which is cheap, can be turned into money very fast. There is a great demand for poultry and poultry products right in this very section, and especially in the large Southern market. This demand is now supplied by the North.

This Company—Our Plans

This Company is a sister corporation of The Long-Bell Lumber Company of this city, which holds first rank among America's largest lumber producers. You may investigate this Company through your bank, Dun's or Bradstreet's, or in any way you so desire. The fact that its name is connected with this project should be sufficient for you to investigate carefully the opportunity it offers.

We want the men and women who buy our lands to know that everything we say we will do we actually will do. We want no man to buy an acre of land who does not believe he is capable of developing his farm as a good farm should be developed. We want men and women who understand how good is the climate and soil and who know how to make the climate and soil return to them the income that is worthy of their effort. Dreamers and idlers will find nothing congenial among the men and women who are coming to the Long-Bell Farms with funds to build their homes and plant their crops, and who know what success is. We have 200,000 acres of land to sell, beside that now being offered for sale, and we want to make the first 100,000 acres we sell quickly dispose of the remaining portion of our holdings. With this end in view we have decided to sell our land upon the following lines:

The Plan

In a table given above you will see exactly what land we have to sell and the prices at which we are selling it. There is no difference between the highest priced land we offer and the lowest priced, except a price difference.

Raw, uncleared, unimproved land throughout the South is frequently sold by similar organizations to our own at $25.00 per acre. We believe the natural advantages and the benefits derived from transportation, etc., in Beauregard and Vernon Parishes tend to make our land have a value in excess of $25.00 per acre.

Read carefully the table below, and as you read remember this: **If you do not take advantage of reserving a farm now at these prices you have no one to blame but yourself.**

All you have to do is to determine the number of acres that you want to reserve. Then remit us 50c per acre, together with the reservation coupon below. As these coupons come into our office they will be allotted land at the prices then prevailing. For instance, if you get your reservation to us the first one you will receive land upon a basis of $12.00 per acre. When time limit has expired we will select you a farm at $14.00 per acre, and allotments will be made in this manner. The 50c per acre reservation applies for any size farm of 40 to 80 acres each.

As soon as we have allotted this land to you we will send you a purchase contract and a receipt for the money you have remitted to us, and we will tell you exactly the price at which your land was bought. If this price is not agreeable to you we will return to you every cent you have paid. There are no "ifs" or "ands" about this statement. The question of price is made for the purpose of quickly disposing of our land and placing settlers upon it, in order that we may settle up this community as fast as possible.

After you receive our purchase contract you will be given ninety days in which to investigate your land, without any further payments. When you have seen your land if it is not entirely to your satisfaction you may select a tract entirely to your own liking, or failing to do this, we will refund every cent you have paid us. This is the way we intend to do business.

We do not want you to buy an acre of this land, nor to reserve a tract, unless you can see your way clear not only to keep up your payments to this Company, but to make the kind of improvements that are necessary in any new farming section.

Our Free Book

No matter whether you send us a reservation or not, be sure and send us the coupon below for our free book entitled "Where Soil and Climate Are Never Idle." In this book you will find every phase of the Long-Bell Farms entirely covered. We will show you by the eye of the camera the very country you will view when you go down to investigate your land. We will give you facts and figures with respect to this section of Louisiana. We will tell you of the work done by the manager of the Long-Bell Demonstration Farm, which comprises 612 acres. You will see pictures of oranges, oats, corn, cotton, vegetables, figs and grapes grown on the very same farm.

We will tell you of a country where, upon a few acres, you can earn an easier and a larger living than you are now doing. We will tell you and show you a section of Louisiana that from the standpoint of education, health, comfort and transportation you can enjoy life to your fullest. We will show you how land values are increasing all over Louisiana, and in this section particularly, and we believe that we can convince you with this literature that here is the place for the man who wants to succeed and to locate.

We do not intend to lure you by fancy pictures of any kind, but we are going to talk to you in a man to man fashion about one of the choicest spots that is as yet left untouched by the plow of man. By all means send for our great literature today. Just clip the coupon now and place it in an envelope and send to us.

TABLE OF PRICES AND TERMS

50c per acre is the Reservation Price, no matter what land is allotted you.

Price Per Acre	Time Limit	Reservation	Down Payment Made After Inspection	Time	Int.
$12.00	Jan. 30 to Feb. 5, 1916	50c per acre	$5.00 per acre	3 to 5 yr.	6%
14.00	Feb. 6 to Feb. 15, "	50c per acre	6.00 per acre	3 to 5 yr.	6%
16.00	Feb. 16 to Apr. 1, "	50c per acre	6.00 per acre	3 to 5 yr.	6%
18.00	Apr. 2 to June 20, "	50c per acre	6.00 per acre	3 to 5 yr.	6%
20.00	June 21 to Sep. 15, "	50c per acre	6.00 per acre	3 to 5 yr.	6%
22.00	Sep. 16 to Nov. 1, "	50c per acre	6.00 per acre	3 to 5 yr.	6%
25.00	Nov. 2 to Dec. 31, "	50c per acre	6.00 per acre	3 to 5 yr.	6%

80 acres is largest farm we will sell to each man at $12.00 per acre.

You select your own land if our selection does not suit you. You are allowed 90 days in which to make an examination in person or through agent. No sale complete until land is examined and accepted by you or for you in writing. If land allotted you is not satisfactory, all reservation money will be returned to you.

How To Send Reservation

Select, for instance, 80 acres. Send us $40.00 as reservation. You will be allotted the land for sale at the prices which prevail when your reservation is received. If not satisfactory to you, we will return the $40 to you on demand. That is all you have to do. First come will be first served. The $12.00 land is the same quality as the $25.00 land. You can select your own farm, if you so desire, after you make your reservation.

Our Guarantee

Send us your reservation and remittance of 50c per acre for each acre you want to reserve, and we will allot you land at the price at which same is being sold at the time your reservation arrives. The only rule we follow is "First come, first served." As mail comes into our office it will be stamped with the day, the hour and the minute, and it will be opened in this manner.

The first reservations receive the lowest price land, the $12.00 land is the same quality as the $25.00 land, and those that follow, follow in this order. We will notify you immediately after allotment the price at which you bought. If this is not satisfactory to you, we will return every cent you have paid.

Long-Bell Farm Land Corporation

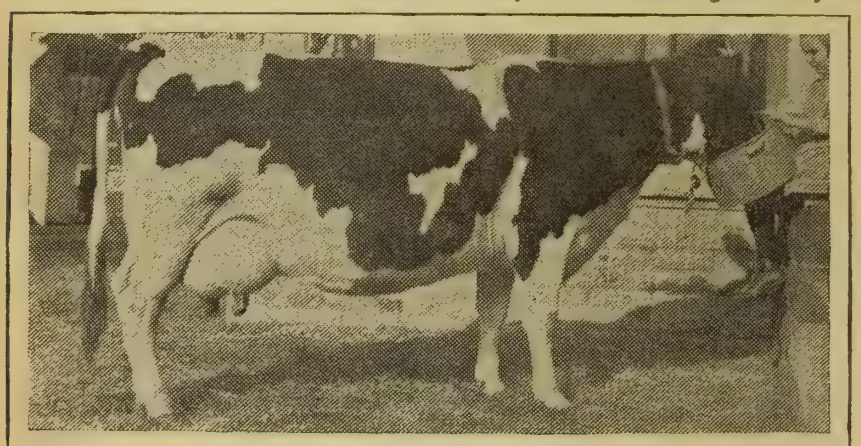
The Farm World Through the Camera

HEADED FOR A STOCK FARM.
Chester Gundlach, Grant county, won boys' stock judging of Guernsev Club.

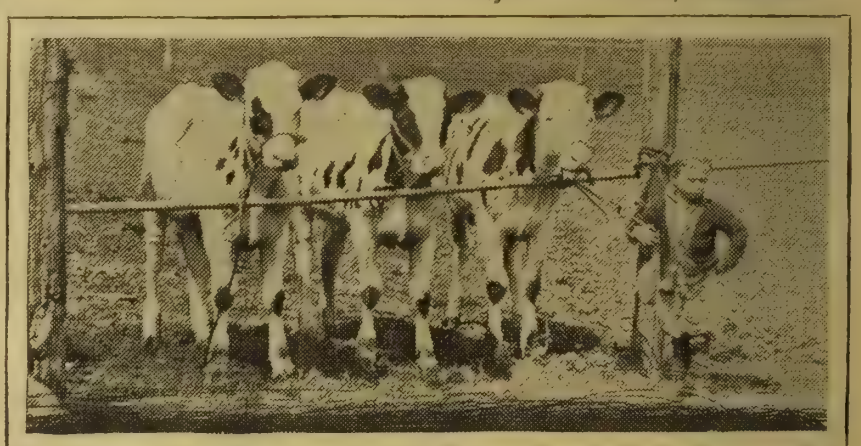
RESULTS FROM A GOOD HATCH OF CHICKS.
Mrs. James A. Vliet, Potomac, Ill., says this picture represents a small per cent of the results of her 1915 hatch. It is certainly a fine-looking and profitable flock.

ALL GOOD, BUT WHICH IS BEST?
This is a line-up of aged cows placed by the boys' judging teams at the Jefferson county meeting. A fine test of what the boys know about a good dairy animal.

A BEAUTIFUL BARRED ROCK.
A champion Wisconsin female owned by F. E. Tindall, Waterford.



THE DAIRY QUEEN AND THE FAIRY QUEEN.
One reason why Wisconsin farm girls take pride in the old home place.



THEY B'LONG TO ME AND FATHER.
Another answer to the question, "Why do boys like the farm?"

C. A. HOWARD, HAMMOND, MINN.
His steer, "Roan," exhibited Farmers' Week at Minnesota "Ag." meetings.

A SEXTET OF SPECIALISTS.
Boy experts in cattle judging, Jefferson County Guernsey Breeders' Association, 1915.

A YOUTHFUL JUDGE OF JERSEYS.
Lauren Klovdahl, winner boys' judging, Wausau-Portage Jersey Breeders.

The Breeds Are Prospering.

Wisconsin Live Stock Associations Report Good Year—Plans For Big Things Will Be Made at Madison, Feb. 9, 10 and 11.

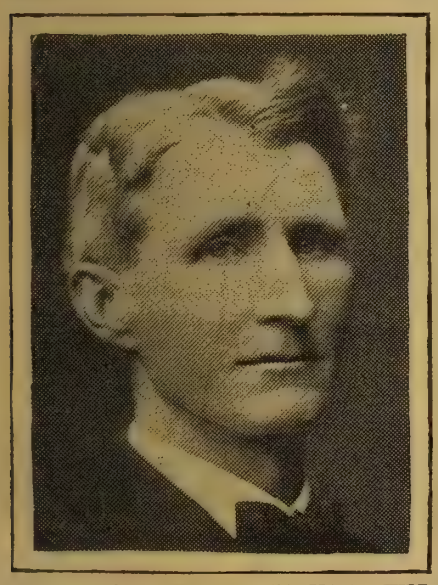
The Breeds Are Prospering.

THE past year has been one of continued progress for the live stock interests of Wisconsin. Many new records have been established by the dairy herds of the state and conditions have been rather favorable for the beef breeds, swine, horses and sheep. Prices have been conservative, yet, upon the whole, such that breeders with good stuff have made a fair margin of profit and at the present time the demand is improving. Swine breeders are looking forward to a prosperous twelve months ahead and despite the embargo because of the foot-and-mouth disease all the principal breeds show an increase for the year. The price of pork on foot has had a chilling effect on breeders, many of whom, however, believe this winter an ideal time for loading up with sows of the right kind. The horse market is especially good and the beef breeds have enjoyed a splendid year, though corn has been short. Recently the Wisconsin Live Stock Breeders' Association asked the officers of each state association to give expression to conditions as they affect their respective breeds, with the prospects for the future, and The Wisconsin Farmer is pleased to publish herewith the replies which have been received at this writing.

20 Per Cent Gain for Durocs.

To the Editor:—Every indication that counts in affecting an approximate prophecy for the year's business ahead of us points in the direction of an unusually prosperous twelve months. With the embargo of the "foot and mouth" on during the past year, we made a gain of 20 per cent over the previous year, and with this cleared up in Illinois, as it has been in other states, we will certainly come out at the end of 1916 with the banner year of our association tacked up in our "hall of fame." More inquiries from the South for information on the breed and where to buy have come to our office during the past forty-five days than has come to us in six months previously at any one time.

Sales in December have broken away from the "jinx" that seemed to have



M. H. O'KEEFE, WAUNAKEE, WIS.
President Duroc Jersey Breeders' Association.

clinched itself to the public auction system the past few months and our breeders are expecting and have a right to expect excellent prices. The price of pork on foot has had a chilling effect on growers, but there never was a better time than in this winter of 1915-16 to get loaded up with sows of the right kind. The price cannot help getting right with the enormous consumption that must eventually and naturally follow the close of the foreign struggle and the grower who is prepared when that time comes will reap the golden harvest of his forethought and preparedness.

Robert J. Evans,
Secy., American Duroc Jersey Assn.

Success to Ayrshires.

To the Editor:—The Wisconsin Ayrshire Breeders' Association was organized to promote the interests of the Ayrshire breed in Wisconsin and the middle West. While its membership is scattered throughout the state, which renders difficult the securing of representative attendance at meetings, yet the association has made commendable progress in growth of membership, which has more than doubled during the past year.

Each year sees an increase in the number of members who are placing their cows on test for advanced registry.

Wisconsin has helped to make history for the breed. At least one world's record has been made in Wisconsin. Many other creditable records have been made. A Wisconsin Ayrshire cow has twice been adjudged the superior of all other breeds, at that court of last resort, the National Dairy Show.

The members of this association have long been prominent in the show ring. It has the honor of having the "Champion Show Herd of America."

The Ayrshire Advanced Registry was started long after that of the other breeds. It has no seven-day or thirty-day tests. It recognizes nothing but a 365-day test. It has made an unparalleled advance in its Advanced Registry work, ranging from the two-year-old record of 17,974 pounds of milk and 738.23 pounds of butter fat, to the mature record of 23,022 pounds milk and 917.60 pounds butter fat. It has demonstrated the staying qualities of the breed. In five consecutive years an Ayrshire cow has produced 84,991 pounds milk and 3,362.35 pounds butter fat, or an average of

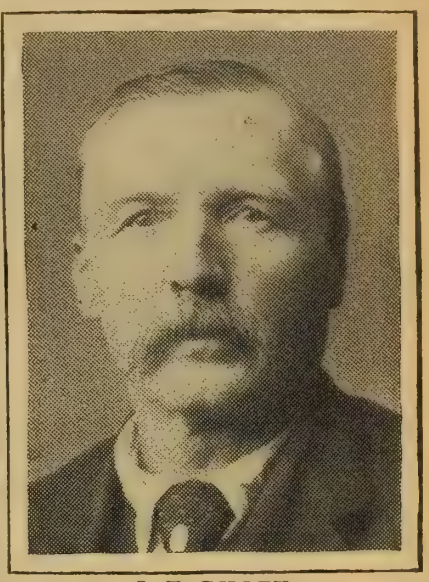
A. H. KUHLMAN, MADISON, WIS.
Secretary Wisconsin Chester White Breeders' Association.

16,991 pounds milk and 672.47 pounds butter fat for the five years. It has proven the usefulness of the Ayrshire cow. A record of 20,349 pounds milk and 774.73 pounds butter fat at twelve years of age and 18,382.6 pounds of milk and 716.36 pounds butter fat in her fourteenth year and then selling at public auction in her fifteenth year for $4,000.00 is a record unequaled by a cow of any breed.

In appearance the Ayrshire cow has no equal. She has proven her superiority as an economical producer in many contests. She is pre-eminently adapted to Wisconsin climatic conditions.

There are about 200 Ayrshire breeders in Wisconsin and this number is steadily increasing, while the established herds are also increasing in size as well as improving in quality.

Considering these facts, the future



J. F. DILLEY.
Secretary Poland China Breeders' Association.

prospects for the Ayrshire breed in Wisconsin are most gratifying.

A. J. McNab,
Pres., Wis. Ayrshire Breeders' Assn.

Good Holstein Year.

To the Editor:—The past year has been one of continued progress for the Holstein cow in Wisconsin. Although the demand for breeding stock has not been as active in recent years, due to

(Continued on page 13.)

PULL STUMPS The Quick, Easy Practical Way

Stump fields cost you money. You can't afford such waste—such loss. Get rid of the stumps—make every acre return big profits. Clear your land the Kirstin way—the quick, easy, practical way. Use the method endorsed by Government and State Officials—and by thousands upon thousands of farmers and land owners—the way that is easiest, most practical and costs you the least, both in first cost and for labor. The Kirstin One-Man way is the *proven* way. From Maine to California and from Canada to the Gulf, there are thousands of Kirstins at work and every one of them will repay their cost many times over. A Kirstin will make good in *your* stump fields.

Kirstin

One-Man Stump Puller

Easily Handled and Operated By One Man.

The improved Double Leverage Kirstin has *every* quality needed in a stump puller—gigantic *power*—variable *speeds*—enormous *strength*. Yet, with all its great power and strength, the Kirstin is the lightest stump puller made, so that one man can carry, handle and operate it with ease.

No Horses Required

In clearing land the Kirstin way, one man alone pulls stumps—your team driven by a boy can be kept busy dragging them away. Just think of the enormous difference in cost between the Kirstin One-Man way and the horse-power method—where it takes a team and a man or two to operate the puller alone.

The improved double leverage Kirstin, the new short lever model, stands the extreme tests of the very hardest stump pulling. The Kirstin's wonderful compound leverage principle develops enormous power—one man alone can easily pull all kinds of stumps—big, little, tough or green—also trees and hedges. In addition to its practically unlimited power, the Kirstin

Changes Speed While Pulling a Stump

No other stump puller at any price contains a similar device. With other machines you keep pulling at the same rate of speed even after the stump has broken loose and the hard pull is over. This is a big waste of time that the Kirstin Multiple Speed-Changing feature entirely overcomes. The Quick-Detachable connections also mean a big saving of time. Furthermore, with the Kirstin you can

Clear Over An Acre From One Anchor

No time lost in having to re-set machine for every stump—no unwinding cables from a heavy drum—no driving a team round and round—no wasted time or effort at all. Just a steady, easy, back-and-forth movement of the Kirstin lever brings stumps out quick and easy. Small trees, hedges, brush, etc., can be pulled *in bunches*. The Kirstin gives you unlimited power. It also has surplus strength in every part—and the *right speed* at the right time. Can be used anywhere—hills, swamps—rough ground or thick timber where no other puller could be used.

If you have any stumps on your farm you need a Kirstin. Why the Kirstin? Because the Kirstin is the simplest, most practical, most efficient land clearing device ever invented. Lowest first cost—lowest in cost of operation. It weighs much less than any other, is a great deal stronger, and is covered by

The KIRSTIN Iron-Clad Guarantee

You cannot afford to start to clear your land before you get the Kirstin Catalogue. This will be sent you FREE. It contains invaluable land-clearing information and full details about Kirstin One-Man Stump Pullers, our Liberal Ten-Day Try-Out Offer, the Kirstin Service Bureau, Time Payment Plans, etc. We'll also send you ABSOLUTE PROOF that the Kirstin is and does all we claim. Try a Kirstin on your land—prove its value to yourself.

In and Around Wisconsin

Fair Associations Hold Annual Meetings and Elect Officers For New Year--Manitowoc Holstein Breeders Meet.

Dousman, in Waukesha county, is planning a mid-winter fair to be held in February and committees have been appointed in cattle, horses, grain and produce, poultry, finance and general.

Trapping of fur-bearing animals has been especially good this winter and hundreds of farmers have picked up some extra money at this sport. J. P. Heffner recently made a $2,100 shipment from Muscoda which brings his total amount of shipments from that vicinity up to $18,000 for the season.

The N. Simon Cheese Company, of Appleton, has amended its articles of incorporation, increasing the capital stock from $15,000 to $50,000. N. Simon, Sr., is president and N. Simon, Jr., is secretary. Mr. Simon, it will be recalled, won much fame in 1910 by building a 4,000-pound cheese and by building the following year for the world's fair a cheese weighing 12,000 pounds.

The annual meeting of the Polk County Fair Association was recently held at St. Croix Falls and the ball started rolling for the 1916 fair. The treasurer's report showed that the indebtedness had been cut down considerably during the past two years, but that the society still owes $2,280. Directors for the coming year were chosen as follows: Pat Murphy, Milltown; Henry Peterson, Eureka; E. J. Day, Eureka; Luke Standard, Taylors Falls; J. A. Mack, St. Croix Falls; H. F. Taylor, St. Croix Falls; James Amundson, Eureka.

More evidence of the value of cow-testing associations has been gathered in Taylor county by R. A. Kolb, county agricultural representative. Recently the representative had calls from parties in Minnesota seeking two carloads of grade cows that have been in a cow-testing association. Mr. Kolb advises that there are a few carloads for sale in the county, but that last fall when an effort was made to organize an association enough farmers could not be gotten together for the purpose. As a result the men with grades for sale cannot furnish the records required by the Minnesota buyers.

The Central Wisconsin Fair Association, which is in charge of the annual Central Wisconsin Fair at Marshfield, held its annual meeting recently and J. C. Kieffer, of Auburndale, was chosen president; A. P. Bean, of Vesper, vice president; R. R. Williams, of Marshfield, secretary, and F. A. Noll of Marshfield, treasurer. The report of Secretary Williams on the 1915 fair showed that the association has a balance of $418.67 in the bank. State, county and city aid amounted to $3,123 and the total cash receipts amounted to $11,248. The indebtedness of the association was also reduced $600 and $2,493 was paid out in premiums.

The Manitowoc County Holstein-Friesian Breeders' Association held its annual winter meeting recently in the theater at Manitowoc. The meeting was held in connection with the community institute and was well attended, more than 100 breeders being present despite the fact that the mercury hung at 17 degrees below zero. Charles Hampke, secretary, reports to The Wisconsin Farmer that it was one of the most successful meetings the association has ever held. Mr. Hampke explained the essay contest which is now being conducted among the school children on the Holstein cow. Pres. Adolph Otto, of Vanders, opened the meeting and Treas. John Lorfield, of Cleveland, reported financial conditions satisfactory. R. J. Schaefer gave a very interesting address on "Raising a Calf From Birth to Maturity." Mr. Hampke reports that the association now has more than 100 members, all willing to boost, so it is seen that interest in the black and white cow is rapidly growing in that county. The association decided to hold a summer meeting in the form of a picnic next June. President Otto Secretary Hampke and Treasurer Lorfield were re-elected to those positions. P. J. Marlborough was chosen vice president and Theodore Pritzel and R. Rabenhorst directors.

The Wood County Cow-Testing Association at its recent annual meeting at Vesper elected E. E. Butters president; W. W. Clark, secretary, and A. P. Bean, treasurer for the coming year.

W. E. Stanfield, of Hillsdale, Mich., who was one of the judges at this year's state poultry show at Madison, has been chosen to judge again next year. George Wells, of Oshkosh, has been selected as the other judge in place of James A. Tucker, of Concord, Mich. The attendance this year was not as good as in the past, but the association will receive about $200 state aid. The following officers were elected by the state association for the coming year: President, M. C. Gerard, Stoughton; 1st vice president, W. H. Ashcraft, Janesville; 2d vice president, Dodgeville; secretary, James G. Halpin, Madison; treasurer, J. R. Love, Waukesha; directors, William Bell, Arlington; Frank A. Cooper, Merrimack; Mrs. L. A. Ross, Bellville; Thos. Clayton, Dodgeville; T. O. Evans, Dousman. January 2d-6th was chosen as the dates for the next show.

Sauk county has inaugurated a road-dragging contest for the farm boys, patterned after the contest which was conducted in Rock county last year. The board of supervisors has named a committee consisting of William Schenck, John Mears and Thomas Pearson to further the contest and it is expected some well-dragged roads will be found in that county the coming season as a result of the contest. The contest will be a town instead of a county affair and each town chairman will be in charge of the contest in his town. The season will end on November 1st when the prizes for the best kept stretch of road will be awarded. The plan is to assign each boy about a mile of road. The town chairman will see that he is furnished with the necessary drag. The road will first be graded and then the boy will be held responsible. The work will be paid for at the usual rates and in addition there will be the prize for the best maintained stretch of road.

September 19th-22d were chosen as the dates for the 1916 Sauk County Fair at the recent annual meeting of the county agricultural society at Baraboo. George C. Astle was elected president of the society; John Martiny, vice president; R. A. Pelton, secretary and L. E. Stone, treasurer, while Wilbur Cahoon was chosen marshall of the fair; A. Mattke, superintendent of gates; G. A. Briggs, privileges, and Henry Netcher, forage. The net profits from the 1915 fair amounted to $1,273, while in former years they ran from $400 to $500. The state aid this year totals $2,500, the maximum any fair can receive. The fair paid out $3,927 in premiums and the total receipts were $13,275. Secretary Pelton in his address to the society said that the fair was fortunate in picking a week of good weather and that the conditions which make a good fair are good weather, good grounds, good exhibits, large crowds each day, successful handling of the crowds and good judges.

Protests from orchard owners in Sauk county are pouring in upon Gov E. L. Philipp at Madison and J. G. Sanders, state entomologist, has urged that the protection of deer as far south as Sauk county is a mistake and that the legislature should at least provide a reasonable open season. Mr. Sanders has collected several bundles of small trees showing how completely the wild deer are damaging the orchards by eating the bark of young trees.

James E. Brett, president of the Walworth County Agricultural Society, which has charge of the Elkhorn fair, which is rated as one of the biggest and best county fairs in the county, retired at the recent annual meeting and these officers were elected for the coming year: President, C. F. Aldrich; vice president, L. A. Kimball; secretary, Samuel Mitchell; treasurer, Harry Cameron; superintendent privileges, W. E. Magill; chief police, Eugene Cornell; marshal, H. E. Wylie. Mr. Brett retired after sixteen years as an official of the fair, sixteen years as treasurer, one year as vice president and one year as president. The meeting also laid plans for the 1916 fair which it is proposed to make the best ever held.

HOME OF MAX BARTEL, WAUPACA COUNTY.
Mr. Bartel is a subscriber to The Wisconsin Farmer and enjoys this paper's weekly visits.

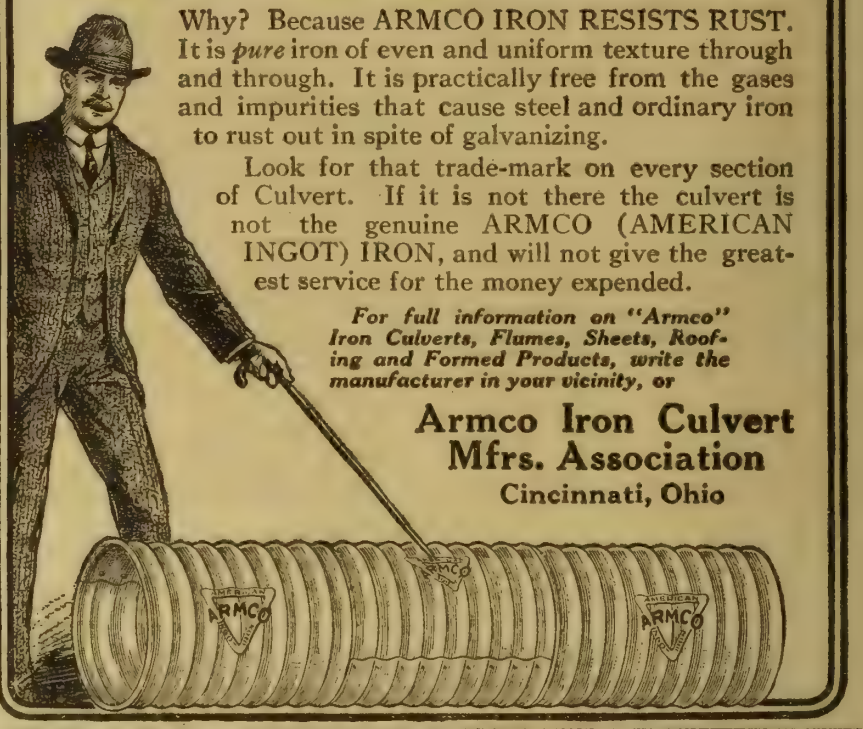
The executive committee chosen for the coming year is composed of these men: Bloomfield, E. O. Kull; Genoa Junction, John Vosburg; East Troy village, O. L. Shearer; East Troy town, Chas. Malaney; Whitewater City, A. M. Hanson; Sharon town, H. Mereness; La Grange, L. H. Phelps; La Fayette, Harry Ellsworth; Whitewater town, J. V. Collins; Lake Geneva city, A. E. Peacock; Spring Prairie, Glen Whitmore; Delavan town, E. F. Fidler; Richmond, W. S. Teetshorn; Delavan city, John Shanahan; Troy, F. F. Minett; Sugar Creek, E. J. Stearns; Walworth town, G. Q. Dunlop; Linn, L. R. Buell; Darien, E. C. Woodford; Elkhorn, G. D. Harrington; Lyons, F. A. Webster; Geneva, Leo. Dunlap; Sharon village, Chas. Shager; Walworth village, E. O. Burdick; Racine county, W. A. Fulton; Kenosha county, D. J. Vincent.

Practically all of the acreage for 1916 for sugar beets in Kenosha and Racine counties has now been contracted for and it is expected about 5,000 acres will be grown this year. The Racine & Kenosha County Beet Growers' Association met recently at Corliss, and, as the growers were satisfied with the price of $6 per ton, there was no movement for higher prices. Officers were elected for the coming year as follows: President, G. Piper, of Berryville; secretary-treasruer, J. Herzog, of Somers.

That Means True Economy!

THAT triangle trade-mark never appears on steel or common iron culverts; you will never find it on "good enough" flume or culvert sections. It is the recognized stamp of quality. It means honesty of manufacture and the assurance of long-run economy and service that will continue long after you have forgotten the price of

"ARMCO" AMERICAN INGOT IRON CULVERTS



Why? Because ARMCO IRON RESISTS RUST. It is *pure* iron of even and uniform texture through and through. It is practically free from the gases and impurities that cause steel and ordinary iron to rust out in spite of galvanizing.

Look for that trade-mark on every section of Culvert. If it is not there the culvert is not the genuine ARMCO (AMERICAN INGOT) IRON, and will not give the greatest service for the money expended.

For full information on "Armco" Iron Culverts, Flumes, Sheets, Roofing and Formed Products, write the manufacturer in your vicinity, or

THE BREEDS ARE PROSPERING.

(Continued from page 11.)

quarantine regulations and the general depression of the live stock breeding business because of the foot-and-mouth epidemic, sales of pure-bred Holsteins were, nevertheless, made into every county in the state during the year 1915. Prices have also been conservative, yet, upon the whole, such that breeders made a fair margin of profit.

At the present time the demand is

WM. F. RENKE, MADISON, WIS.
Ex-Secretary Wisconsin Sheep Breeders' Association.

improving. Breeders generally report increased inquiry for their surplus stock, but an inclination of buyers to still demand animals at low prices, except in cases where some particular line of breeding is desired. A few months hence will undoubtedly improve this condition also, and again find prices on a normal basis and plenty of buyers willing to pay them.

New centers of Holstein interest have continued to spring up in the state. There are not fifty-one local Holstein associations. A year ago there were forty-three. The impetus that these have given the Holstein trade in the past may be taken as a criterion of what that trade will be in the future.

Further progress has also been made by the Holstein by way of establishing new production records for the state. One of the most notable are those of the two four-year-old cows that completed records of more than 1,000 pounds of butter for a year's production. These are the first four-year-old cows in Wisconsin of any breed to make such records. W. J. Gillett, of Rosendale, is president of the Holstein-Friesian Association of Wisconsin, and Chris. Schroeder, of Racine, is secretary.

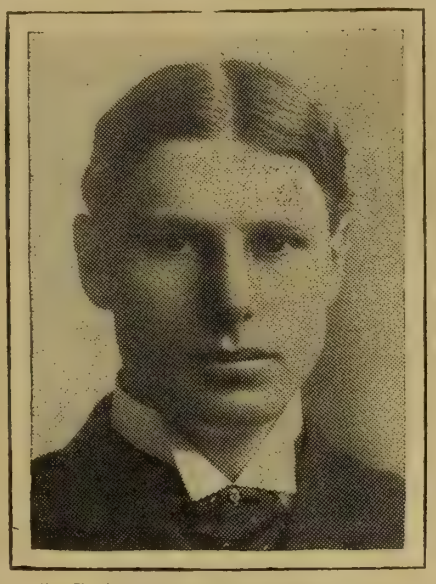
Chesters in the Front.

The Chester White hog has lately taken the lead in many states. At the great Iowa State Fair last fall they outnumbered any breed by far. So let us get together and not have it said that we breeders of Wisconsin are lacking in any way to uphold this breed and we can place them where they belong, in the front rank, if we organize as we should and do a little work. And without organizing and only working singly but little can be accomplished. I have been now almost thirty years breeding the Chester Whites and when I look back over these years till the present time I can't help but feel that the Chester White hog has steadily grown in favor with the farmer of Wisconsin. They have experienced no boom, but just a steady, natural growth. They have proven their superior breeding qualities and natural ability to put on growth and flesh on pasture where many breeds fail. The climate of Wisconsin is adapted for our breed of hogs. And I am urging you and as many as possible to come to the meeting. For years at our state fair a breeder of some other breed has judged the Chester White hogs. What we must have is a Chester breeder who has studied the type of our hogs and the true type or standard should win.

We will have no set program, but will appoint you all on the program. I wish to announce to the Chester White breeders of Wisconsin that our association will meet at Madison February 11th and must here urge all our brother breeders who can possibly attend to do so. John Fisher,
Pres. Chester White Breeders' Assn.

Fine Year for Polands.

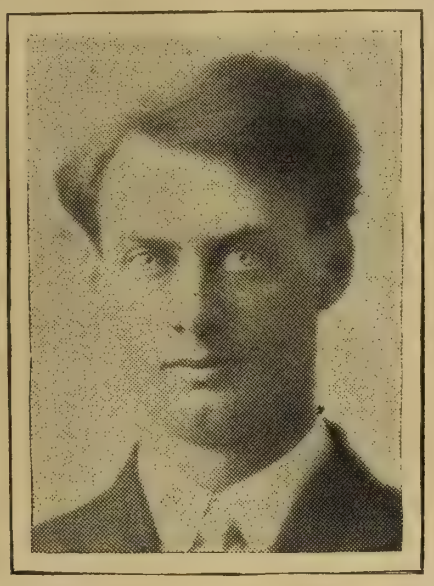
To the Editor:—Notice is hereby given that the annual meeting of the Wisconsin Poland China Breeders' Association will be held at Madison, Wis.,



J. G. FULLER, MADISON, WIS.
Secretary Wisconsin Horse Breeders' Association.

on February 11th at 7:30 p. m. This will be during the week of the Farmers' Course at Madison, also right after M. Madson & Sons' sale. This places the meeting at a time when we should have a good attendance and a good attendance is the life of any organization.

W. M. McFadden, president of the National Swine Growers' Association, also secretary of the American Poland China Record Association, is planning to be with us and talk on Futurities, and the great advancement that the breed is making in Wisconsin. The record association has taken up the pig club matter, which is a mighty big thing. The record association, in taking hold of the futurity, has, in my humble estimation, taken the most important step of its existence. To my mind no breed is offering such inducement to the young breeder as the Poland Chinas are in this great futurity show. You have eight chances at the money in each sow and boar



PARK GELBACH, LANCASTER, WIS.
President Wisconsin Aberdeen Angus Breeders' Association.

class and litters; also let every breeder support the futurity to the extent of his herd nomination and make the greatest showing the breed has ever made at the Wisconsin State Fair in 1916. The importance and value of the show ring as the standard establishing influence of the swine business can scarcely be overestimated and now with the very great majority of the Poland China winning animals so uniform and excellent. Each show year will see an improvement in the exhibits.

J. D. Diley, Secy.,
Wis. Poland China Breeders' Assn.

Bright Prospects for Sheep Men.

The coming meeting on February 10th, will be the tenth annual gathering of the Wisconsin Sheep Breeders' Association. The association has promoted a closer co-operation and a fuller understanding between Wisconsin sheep breeders.

Our sheep breeders, while they are greatly outnumbered by those pro-

President Wisconsin Holstein-Friesian Breeders' Association.

moting other branches of Wisconsin live stock, have established an enviable reputation in the breeding world. At every national exposition and middle western state fairs they have been represented and in most cases have led all other states or provinces.

The part that this association has played in this development cannot be overestimated. The association has also been a consistent backer of the

CRANBERRY GROWERS MEETING.

To the Editor:—The twenty-ninth annual meeting of the Wisconsin State Cranberry Growers' Association was held in Grand Rapids, Tuesday, January 11, 1916, in Daly's Opera House. Pres. Andrew Searls called the meeting to order at 10 a. m. with about thirty-five growers in attendance from the various districts. Mr. Albert D. Hedler, of Minneapolis, Minn., who is secretary of the Cranberry Lake & Development Company, at Phillips, Wisconsin, where a large bog is being constructed along scientific methods, and Mrs. Lydia M. Huyck, of Minong, Wisconsin, who is manager of the Lewis Cranberry Company, represented the northern part of the state; Mr. H. R. Laing and Andrew Bessig the eastern; Meesrs. H. J. and H. H. Gebhart, of Black River Falls, the western, while the majority came from the Mather and Cranmoor districts, which are at present the largest producing sections. The reports of the treasurer and secretary showed the financial condition to be the best it ever was, there being funds on hand which will enable the carrying out of several experiments along the line of sand pumping and pumping from a battery for a water supply, also experiments in spraying, which is now generally admitted to be necessary for the production of high quality fruit.

The old officers were re-elected, also Dr. C. L. Shear, of Washington, D. C., of the bureau of plant industry, was unanimously elected an honorary member as a recognition of the splendid work done in the interests of the cranberry growers. Mr. O. G. Malde, superintendent of the cranberry station, was also made an honorary member.

Mr. Searls' address was as interesting and helpful as it always is and dwelt upon the necessity of better frost warnings, telling of the thousands of barrels that might have been saved by a man on the ground to watch and warn growers. Mr. Malde, at Cranmoor, was wonderfully efficient, but the other districts needed a man also. Mr. A. U. Chaney, manager of the National Fruit Exchange, sent a paper on the necessity of spraying for keeping quality and cited cases in the East where it had been effective.

Mr. Andrew Bessig, trouble man for the exchange, told of his work adjusting claims. Mr. O. G. Malde gave the report of the station. Mr. C. R. Treat told of some wonderful results from the use of rock phosphate, harvesting over 600 boxes from one acre. Mr. C. M. Seeker spoke of the state fair exhibit and its possibilities. Mr. Albert Hedler and Miss Huyck told of the progress in the northern part of the state, which promises great things. Mr. S. U. Whittlesy spoke on mills and graders and outlined a new grader which all seemed to think a great improvement on present graders. Mr. F. L. Brandt, representing the Otto J. Koch Advertising Company, of Milwaukee, spoke interestingly on the possibilities of advertising to increase sales. Mr. F. J. Wood, president of the Wood County National Bank and also a stockholder in several bogs, spoke from the bankers' standpoint and told of the value of the industry to the section in which it is located.

The executive committee was authorized to use the funds for the best interests of the association.

In the evening Mr. Malde gave to a very appreciative audience a free exhibit of the many interesting views he has collected of the industry in the different parts of the state.

J. A. Fitch, Sec.

WHAT SHALL WE PLANT?

To the Editor:—Everyone on the farm and every gardener should answer the question now and send their orders to some reliable nursery or seedsman and get them booked. It is not necessay to send the money until you notify them the ground is ready. If you delay until planting time their assortment may be broken or they may be sold out.

Every farmer should have an orchard sufficient to furnish all the fruit his family needs. Twenty-five or fifty trees are enough if properly taken care of. Every fruit tree needs a little annual pruning. While young they need protection from mice and rabbits, when old they need manure every season. As soon as they get to bearing they need spraying three times at least if you expect good fruit.

Now about your location. There are very few places where you cannot grow at least a dozen kinds of apples, three kinds of plums and two kinds of cherries. The best location for the orchard is the high timber ridge, clay soil and northern slope. On such a location, with a love for the business, any man may grow fruit to sell if he selects the right kinds and gives the necessary care. The ordinary farmer can't make money growing fruit for market, still if he has the right kind of boys and girls he should give them an acre and let them grow strawberries for pocket money.

Now about varieties. For low ground and rich, black soil, plant Duchess, Tetofsky, McMahon, Longfield, Wealthy, Plumb's Cider, Patten's Greening, Windsor, Scott's Winter, McIntosh and N. W. Greening, and for top grafting a few Hiberian and Virginia crabs; for crabapples, Hyslop and Whitney; for plums, De Soto, Forest Garden and some of the new varieties lately brought out by Professor Hanson. The most profitable pear you can plant is one that never leaves out, if away from lake influence.

For the best one kind strawberry use the Dunlap, if two kinds are wanted add the Warfield, but this is pistillate and must be beside a perfect flowering kind. Of everbearers, the best three well tried in the last ten years are Progressive, Superb and Americus. If these are set in the spring and the fruit stems kept off till July they will then bear till they freeze.

Any questions asked through The Wisconsin Farmer will receive my prompt attention. Geo. J. Kellogg.

OATS

OATS, WHEAT, SPELTS, BARLEY

A quartette of giants! Great money makers! Bred to health, stooling qualities, stiff, strong straw, big yields—all registered pedigree varieties endorsed by Agricultural Stations.

SALZER'S NORTHERN GROWN SEED CORN

High grade, high testing Wisconsin and Minnesota grown Seed Corn. The kinds that will surely ripen in 1916. We have lots and lots of it. Pedigree strains.

ALFALFA, SWEET CLOVER, SUDAN AND BILLION $ GRASS

A quartette invincible. The first two made possible to grow and flourish on every farm in the United States, owing to Salzer's hardy ironclad strains—the last two growing 60 tons hay richer than Timothy in 10 weeks time on 10 acres! 50,000 bushels Seed Potatoes! 35 Packages Earliest Vegetables, $1.00, postpaid.

SALZER'S SEED CATALOG (184 Pages)

For 48 years it has stood for quality in Farm and Vegetable Seeds. It's free for the asking. A postal will bring it to you. Send for it. Brimful of good things!

The Farmers' Open Forum

WITH CONTRIBUTIONS FROM READERS OF THE WISCONSIN FARMER

Farmers' Institute Follow-Up Work.

To the Editor:—With the advent of this season's farmers' institutes a more or less new feature has been added to the work to secure results as immediate as possible and to furnish ground work for summer institutes and farm demonstration meetings. The institute worker takes his pad after each session of the institute when the farmers are gathered in groups discussing phases of advanced agriculture and gets the names of farmers who want assistance in any way and then records the names of the farmers in his report with the kind of assistance which each farmer desires.

In this way thus far this season one cow-testing association has been signed up for and is now in working order with a tester and two others are in course of organization. The indications are now that as the direct result of this season's institutes at least a half dozen new cow-testing associations will be organized.

Thirty-six farmers at one meeting signed up for work in connection with the department of farm management of the college of agriculture. At another institute six farmers signified desire for help in instituting properly septic tanks in connection with their farm homes. These will be built under the supervision of the department of engineering of the college of agriculture. Many farmers are asking for help with spraying for late blight on potatoes. At two institutes fifty acres of alfalfa have been signed up to be put in properly with lime and inoculation. As the result of another institute milk sheets were called for and in all probability one farmer and his sons will begin weighing the milk of each cow. At this same institute a move was set on foot to secure a pure-bred sire for that community. This community will also organize a community potato growers' association and begin to grow better potatoes of a single variety for the market. Three concrete silos were signed up for at another institute.

The names of the farmers desiring help will be indexed upon cards at the office of farmers' institutes in Madison and then just as much service as the office can give will be given to help the farmers realize their desires.

As rapidly as results are secured through the efforts of these farmers community meetings and institutes will be held upon the farms to show and demonstrate the value of what has been done and to get other farmers to use the improved methods.

It is thus seen how a farmer signifying his desire to do something as the result of a farmers' institute in a community may be made to work out a great improvement to the benefit of every farmer in the community. By this way of doing things it is hoped to keep the farmers' institute up to its past standard of efficiency and if possible to make it even a greater agency for the agricultural advancement of Wisconsin.

Farmers at the remaining institutes ought to connect up with the office of farmers' institutes in this way and secure all of the assistance which the office is able to give. It is the desire of the office to help farmers at any and all times with propositions in which they are interested. In this way the most expert and scientific help may be brought to the farm.

E. L. Luther.

Appreciates Mr. Ingalls' Work.

To the Editor:—In all this talk of county representatives it is not right to let the work of the Eau Claire county representative, G. R. Ingalls, pass unnoticed. He is a man who gives himself personally to his work. He is never too busy to go to any f mer when he can be of any assistance. He is raising the grade of dairy cattle in the county by his co-operation with the farmers in the purchase and disposal of registered sires. In two instances, of which I know personally, he has financially aided beginners to get cows. He is a help to the teachers by giving entertainments with a lantern and pictures, and on one cold, snowy evening drove his car thirty miles to give such an entertainment out in the brush to not disappoint the teacher and people gathered there.

He is striving against great difficulties in that the people were not ready to accept his help, but he has surely made friends all over the county. The boys of the short course, which he conducts every year at Eau Claire, are his devoted admirers and friends.

Every teacher in the county feels he is a source of great help, when, in trying to raise the standards of the people of her districts, she runs up against a stone wall.

He has a charming family and a very comfortable home, "Inglenook," just two miles from Eau Claire. He has established there "the home of pure-bred Guernseys," so he practices what he preaches.

A Resident of Eau Claire County.

Jerseys the Pride of Longview.

R. A. Long, Lumber King, Gratifies a Lifelong Ambition, Builds a Million-Dollar Farm, Stocks It With the Best Jerseys and Gets Back to the Simple Life.

WHEN R. A. Long, farm-born and country-bred, turned sixty, he decided to play a little, for the first time in his busy life. Being of a thrifty nature, he proposed to make his playing pay. Accordingly, he gratified a life-long ambition, set about to construct and equip a million-dollar farm, employed

R. A. LONG, OWNER OF AMERICA'S FINEST FARM.

a farm manager with instructions to develop this farm into a successful enterprise. Thus Longview Farm, the finest in America, came into existence.

It was no idle dream that obsessed Mr. Long all the years he was building his fortune out of yellow-pine trees, cutting a half billion feet of lumber a year down in Louisiana, Texas and Arkansas. He had been born and brought up on a farm; he had tasted many of the hardships of farm life in the early days; there had been times when the cup was bitter, but he drained it to the last dreg. Being one of eleven children on a 300-acre farm in Kentucky fifty or sixty years ago when there were no unnecessary frills or frolics, his was not an ideal life of ease. Still, throughout all the years, when fortune led him to the mountain-peak and offered him his choice of every good and desirable thing the world had to offer, R. A. Long kept thinking of the time when the ideal farm of his dreams would be his in reality. Like that other great Kentuckian whom he resembles, both physically and mentally, R. A. Long came to realize more and more each year, that "no other human occupation opens so wide a field for the profitable and agreeable combination of labor with cultivated thought as agriculture." Thus realizing the truth of what Abraham Lincoln said, Mr. Long set about to make his dreams come true.

"My life has been spent in hard work," he said, half apologetically, to those who asked why he turned from city pavements to country lanes. "I have never educated myself to play. Now I realize that I must not work too hard the remainder of my life. I must rest more and have more recreation. I was reared on a farm in Kentucky. I was always fond of live stock, of horses, cattle and hogs. When I decided to give more time to play I said to myself, 'There is something I like, why not play at that?' So I set about it on Longview Farm. It is good soil, it is the right distance from town, I can stand in the center of my farm and see practically all of the nearly 1,600 acres. It is a delightful view. My great aim shall be to make the place beautiful and attractive to the eye, but that will not be all; we shall make it pay."

Having started with nothing, found two business ventures uncongenial and unprofitable, and then amassing a fortune, beyond most men's dreams of avarice, Mr. Long did not propose to throw his money to the winds which sweep over Longview. He was going to play a bit, but he was too good a business man not to see to it that his farm investment paid good returns. It recalls the incident which his friends relate, with great glee. At a meeting of lumbermen, he was introduced as "the man who paid $10,000 for a horse." After the laughter had subsided, Mr. Long arose and turned the laugh on the man who had sought good-naturedly to ridicule his "extravagance," by saying, "I did pay $10,000 for a horse, but already this year that horse has earned me $4,000, which is forty per cent upon my original investment, and he will return me that much profit annually for the next ten or fifteen years. Have any of you made a better investment this year?" Longview is a rich man's farm, but the day is already in sight when it will prove itself a profitable money producer.

THE FARM HOME AT LONGVIEW, WHERE R. A. LONG GRATIFIES HIS DESIRE TO GET BACK TO THE COUNTRY.

Longview has many points of distinction and superiority, not the least being this: While it is the finest farm in the country (in point of general beauty, modernness, up-to-dateness of equipment, and convenience and comforts for men and stock alike) no other great "show-place" farm was originally designed on the large scale of Longview. When Mr. Long made up his mind to have a farm for himself, which should embody his ideas and ideals, he visited the large stock farms of Kentucky, Illinois, Wisconsin and other states. He found that none of them had been originally planned on the extensive scale to which they afterward grew, and consequently there was a lack of harmony and symmetry and, to a certain extent, a waste of energy. Longview was in Mr. Long's eyes, in perspective just as it appears today, before ever a shovelful of dirt was turned, before ever a rod of fence was built, before ever an animal was brought to the place. It is the only stock farm in America of its size, that was planned, laid out and built at the start to carry on the maximum of business to which it is intended to attain.

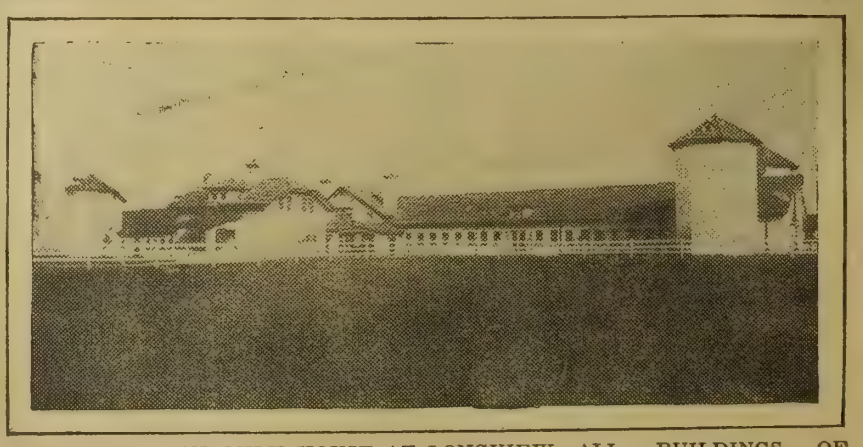
INTERIOR OF DAIRY BARN AT LONGVIEW, A VISTA OF IMMACULATE WHITE.

To accomplish the ends he had in mind, Mr. Long bought fifteen separate farms, merging them into the one farm of Longview, comprising 1,583 acres, eighteen miles out from the magnificent fourteen-story R. A. Long office building, the first steel-frame structure of consequence in Kansas City and one of the best appointed buildings in the United States. Longview is reached by one of the splendid rock roads for which Jackson county is becoming noted all over the country. It is not the secluded home of a millionaire who hides himself from public gaze. Quite the opposite; the latch string is always out at Longview, the public always welcome. Mr. Long may stand in the south loggia of his wonderful farm home and declare, with Alexander Selkirk, "I am monarch of all I survey; my right there is none to dispute," for an unobstructed view of all the splendidly-lying 1,583 acres is to be had from the hill upon which the home is built. Extending practically as far as the eye can reach is a vista of gently rolling hills and slopes, of alternating fields and forest glades, of splendidly modern buildings, all of white stucco, their red tile roofs blending with the various shades of green in the summer time, until Longview is a genuine Corot among farm landscapes. No more magnificent countryside view is to be had in all America than from the front porch at Longview, out over the acres where as good-blooded stock as can be found anywhere in the world passes its peaceful existence, past the church and school where the gospel of uplift and culture is preached and taught to old and young alike among the 150 employes of the farm, from dairy barns to show-horse barn, from work-horse barn to hog barns, with garage, sunken garden, greenhouse, pumping station, 20-acre lake, half-mile driving track, fifteen tenant houses and all the miscellaneous structures and attractions arranged most efficiently and effectively to form the harmonious whole.

Figures have a way of appalling the average mind at times, but no comprehensive idea of Longview and the scale upon which R. A. Long is carrying his farming operations can be had without the use of a few, at least.

Of the 1,583 acres, included in Longview, 940 were under cultivation last season, the chief field crops being alfalfa, corn, cane hay, clover, millet, oats, soy beans, timothy and wheat. Not one ounce was sold, every particle being fed or consumed upon the farm where it was grown. With Mr. Long's far-reaching plans as yet incomplete, there are today 50 saddle horses, 48 harness horses, 33 mules, 12 Percheron horses, 175 Jersey cattle, 75 beef cattle and 350 hogs at Long-

COW AND SHELTER BARN FOR JERSEY HERD AT LONGVIEW, R. A. LONG'S FARM



DAIRY BARN AND MILK HOUSE AT LONGVIEW—ALL BUILDINGS OF STUCCO AND TERRA COTTA.

view. Large as these figures may seem to the average 160-acre farmer, they do not represent the limit of Mr. Long's plans, for when Longview is concluded and stands forth as its creator saw it in his mind's eye before ever a stroke was done upon it, the number of Percherons will be increased to 50, the hogs to 750 and the Jerseys to 250.

Necessarily, with such large quantities of stock of splendid blood, there must be quarters not only in keeping with the wealth of Mr. Long and his reputation for doing everything right, but also with the needs of so immense a farm institution. A brief resume is all that can be given in the limits of such an article as this:

The dairy barn group consists of a dairy barn, 36x313 feet in size, with a capacity of 104 cows; a shelter shed, of the same size, with a capacity of 125 head; a calf barn, with a capacity of 75 head; a milk house, to which the milk goes through a covered passage, under the most sanitary conditions possible; a hospital and bull-pens. The whole inside of the dairy barn and the shelter barn is plastered smooth and painted. All the passageways, along which the blooded cows walk, are of concrete. All the corners and angles are rounded, the more easily to be kept clean and sanitary. The stalls in which the cows stand are floored with cork block, as soft and yielding to the feet as the finest Brussels carpet. A perfect system of ventilation throws a constant supply of fresh air into the dairy barn and removes the foul air. Feed carriers down the center carry the feed to the individual cows in their stalls. In one corner of the barn are the washrooms of the attendants, with lockers and shower baths adjacent. Each attendant is required to bathe and don a fresh white duck suit before milking begins. The milk is produced under the supervision of the Medical Milk Commission of the Jackson County Medical Society and each bottle bears its seal. To produce certified milk, which means milk as it comes from the cow with nothing added to or taken from it, requires a process, namely: All attendants bear medical inspection, the cattle are tested annually for tuberculosis, the cattle are groomed and washed before each milking, the milkers using plain white duck suits while milking and between the milking of each cow hands are washed, and so on. The milk, within a few moments, is strained and cooled below 50 degrees Fahrenheit and must so remain until delivered to the consumer. This insures absolutely pure milk with a bacteria count that is so low it is entirely harmless to the most delicate organism. This milk is largely purchased upon doctors' prescriptions for infants and invalids. Mr. Long furnishes Longview certified milk to the Mercy Hospital, of Kansas City, which hospital is for crippled and deformed children and absolutely free.

The draft-horse group of buildings consists of a barn, 36 by 240 feet in size, with a capacity of 65 head, wagon shed, implement house, blacksmith shop and boarding house for teamsters, forming a quadrangle in the center of which is a beautiful sunken garden.

The show-horse barn is the largest barn in the West, 100 by 225 feet in size, with a capacity of 36 horses, in addition to an enclosed, tan-bark arena, 70 by 175 feet in size, carriage room, harness rooms and sleeping rooms for the attendants. In one of the wings are thirty box stalls and six tie stalls for horses of high pedigree. In the other wing is a large living room for the attendants, with ten private rooms for their use, all fitted with baths. Between the two wings, in front, is a large waiting room or reception room, feed rooms and harness rooms. Around the side of the exhibition arena is a raised platform from which the fortunate guests may watch the animals as they are put through their paces.

Three hog houses, a greenhouse, a garage, a pumping station, a gateman's lodge, a stable at the driving track, a general manager's residence, an assistant manager's residence, a group of cottages and boarding houses for the dairymen, fifteen tenant houses in a large group and last, but by no means least, a combination church and school, for the exclusive use of Mr. Long's farm employes and their families—all of these buildings, like the larger and more imposing barns, of snowy white stucco, with red tile roofs—is it to be wondered at that superlatives lose their significance when Longview is first seen? Nor must mention be omitted of the seven miles of private rock road on the place, costing $50,000, and the twenty miles of snow-white board fence, each rail twelve feet long, two inches by six, so mitered and joined into the eight-foot posts that there is not a nail or a peg in all the twenty miles of hog-tight fence, which cost $25,000. Not a thing has been overlooked at Longview which might add to its beauty, comfort or convenience. The dream was of a lifetime, when it came true absolutely nothing was lacking.

The crowning glory is the farm house, a beautiful structure of white stucco, with red tile roof, commanding a hill from which an unobstructed view of the entire farm is to be had. The house is furnished in the best of taste and is a "home" in every sense of the word. Mr. Long has three great pleasures in life: His work, his church and his home. Longview gives him every opportunity to be with his family amid beautiful and congenial surroundings.

All this wonderful vista, all these magnificent structures would be but poor realization of Mr. Long's lifetime dreams if they were not devoted and dedicated to the improvement of farming and country life conditions generally. Houses and barns have risen under the hands of workingmen; it has remained for Mr. Long to put the soul into them. Dairy barns would be but poor fruition of a lifetime of effort if they did not contain the best stock procurable, if they were not devoted to making that stock still better. So it is at Longview.

No better blood is to be found anywhere in America than in the stock barns there, witness the fact that within the last two years first prizes have been won on horses, Jersey cattle and hogs at the most important fairs and horse shows. Perhaps the most noted prize was the grand champion five-gaited stallion, won at the Panama-Pacific Exposition in 1915, by My Major Dare. Innumerable prizes and trophies were won by Mr. Long's gifted daughter, Miss Loula Long, easily the most daring and accomplished horsewoman of America. Miss Long was the sensation of the 1915 New York horse show. She has shown at the most important shows in the United States and Canada, taking prizes at the London show, with her noted horse, The King, several years ago. Her most notable animals, to be found in the big show-horse barn at Longview, when not being exhibited against the pick of the world, are My Major Dare, Kentucky's Best, Imperious King, Fascination, Exposition, Catherine Grigsby, Aviation, Hesitation and Revelation. While Miss Long is thus partial to the show horse, and her father loves a fine horse devotedly, his hobby is really the splendid Jersey herd he owns, the head of which is the magnificent bull, Queen's Raleigh, and his herd of pure bred Duroc Jersey hogs. Mr. Long has won much in the live stock world; he aims still higher and is eager to do what he can to make the United States take still more commanding position in the live stock world.

Any description of Longview which did not include a pen picture of the owner would be lacking indeed. R. A. Long is sixty-five years young, an indefatigable worker who has earned every dollar of the many millions he possesses. He modestly asserts that his success is due to no unusual, uncopyable methods. "Success is wholly a matter of price," he declares, adding: "Some men will not pay it, because it means toil and self-sacrifice. A few will pay it. They labor diligently day and night and practice economy. The members of no profession, of no calling, are outside the unchangeable law that demands hard, unremitting labor as the cost of advancement."

Starting out in life a poor farm boy, he ventured into the big, waiting world with only $700 capital. Today The Long-Bell Lumber Company, of which he is president, and its allied companies have investments aggregating $31,000,000, consisting of some 350,000 acres of virgin yellow-pine timber in

A Good Strong Calf for Every Cow

Dr. David Roberts' ANTI-ABORTION Drives Out Cow Abortion

The owners of over 5000 herds of cattle in the U. S. say that Dr. David Roberts' Anti-Abortion Treatment does wipe out contagious abortion. These people speak from experience. They *know*—they do not *guess*. They are to be believed rather than people who merely give it as their opinion that contagious abortion cannot be successfully treated. Let us give you one example—one of the 5000—which gives indisputable proof.

A Minnesota Example

Less than two years ago Dr. Roberts went to Minnesota and bought a herd of pure-bred Holsteins known to be afflicted with contagious abortion. It was a desperate case. Many treatments had been tried without success. But Dr. Roberts did not hesitate. He began his treatment on the infected animals and all traces of the infection were wiped out. The cows and heifers dropped healthy calves, carried full time—a good strong calf for every cow. Three of the cows made butter records of 14 lbs., 19 lbs. and 22 lbs. of butter per week. One has a milk record of 2000 lbs., another of 2200 lbs. per month.

Dr. Roberts has no more fear of contagious abortion in cows than if the disease did not exist, if cows are free from tuberculosis. He is absolutely master of the situation. You can apply the Roberts Treatment yourself. You can do what Dr. Roberts does if you will do what he tells you to do.

Dr. Roberts' Anti-Abortion Treatment is shipped, with instructions, direct from the laboratories at Waukesha. Address

Get The Sled That Doesn't Tip

The real anti-tip sleigh that will at once appeal to sleigh users. Runners turn on pivots just below the beam which always carries load directly over runners regardless of how team is turned and always carrying load on four corners.

The West Bend ANTI-TIP Oscillator

has, besides the anti-tip features, many other features, individual to this sleigh only. It is very flexible—pulls out of ruts much easier—takes the pulling and backing strain off runners and distributes it uniformly through center of sleigh which makes sleigh run easier and back freely like a wagon. It dodges trees and obstructions far easier. It is stronger and more durable owing to weight distribution. Requires no bolsters, which brings box 6 inches closer to ground, yet gives higher clearance below beam. Simplicity gives it durability far beyond any other sleigh. It has been tried out and found to be perfect in every respect.

Ask your dealer to show you a West Bend ANTI-TIP or write us for full details.

Louisiana, Texas and Arkansas; ten modern manufacturing plants, the annual output of which is from 25,000 to 30,000 carloads of lumber; eighty-six retail lumber yards, in Kansas, Oklahoma and Texas, a railway system of 138 miles and a string of general merchandise stores operated at the various mills; to say nothing of the two demonstration farms on the cut-over lands of Louisiana, one of 20 acres, the other of 612, where experiments are constantly being made to prove the soil efficiency of the sections and to assist the settlers brought into these new lands by the Long-Bell Farm Land Corporation, of whose executive board Mr. Long is chairman.

Having seen his pence multiply and re-multiply far beyond the most boyish dreams, Mr. Long has rendered good account of his stewardship, giving liberally of his plenty to those less fortunate and to improve conditions both in the country and in the city. The list of his benefactions is extremely long. The most notable items are these: $400,000 toward the erection of a large, non-sectarian hospital in Kansas City, under the auspices and control of the National Benevolent Association of the Christian Church, this gift ultimately to be increased to $1,000,000; $250,000 (at various times) to the Independence Boulevard Christian Church of Kansas City; $100,000 to colleges and universities throughout the country; $50,000 to maintain a national paper for the Christian Church. In addition, he is a liberal contributor to practically every worthy cause and for the last two years has maintained a tent city at Longview where 200 poor women and children are cared for each year, being given deep, revivifying breaths of God's fresh air. Whenever and wherever his hands have found anything to do to alleviate pain, relieve suffering and distress and scatter seeds of kindness they have done it, quietly, unostentatiously. In view of which there is none to question his right to lavish money as he chooses at Longview, finding in the farm (from which he climbed to the eminence of fame and fortune) the rest and recreation he craves, the fulfillment of what Lincoln had in mind when he said, "Every blade of grass is a study, and to produce two where there was but one, is both a profit and pleasure," such a profit to this self-made man of millions as no dollar sign could possibly measure, such a pleasure as no other occupation could possibly furnish.

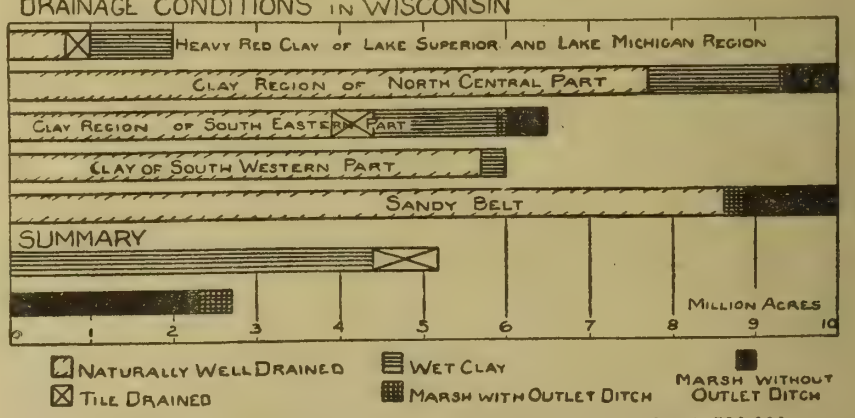
Talk Over Value of Drainage.

Wisconsin Farmers and Engineers Give Attention to a Subject Which Is of the Utmost Importance.

DRAINAGE is one of the big problems before the farmers of Wisconsin today. There are in this state something more than 7,000,000 acres of land in need of better drainage about 2,500,000 acres of which are marsh and the remaining 3,500,000 acres of wet clays, much of which is already under the plow, but which can be improved and made to produce more by better drainage.

It is encouraging to note the interest which the farmers are taking in this subject by their attendance at the meeting of the Wisconsin State Drainage Association at Grand Rapids, Wood county, last week. This was the second meeting of this association.

The local attendance was especially good, Grand Rapids being in a portion of the state which is reclaiming vast areas of farming lands. The farmers who have met crop failures because of improper drainage are beginning to realize the value of tile and drainage and that a wet soil properly tiled and drained can be made to produce increased yields. Owners of marsh lands are also seeing the value of reclaiming them and the experiences of scores of farmers who had established proper drainage which were related at the convention indicated that the increase in the value of the land more than offset the original cost.



Excessive water in soils is detrimental for these reasons:

1. Lands are too soft to cultivate.
2. Cultivation is delayed in the spring.
3. Wet soils are always sold.
4. Air is kept out of the ground and decomposition of vegetable matter is checked.
5. Standing water prevents root development.

Once the owner of wet land realizes these conditions he begins to consider drainage and the address of E. R. Jones, of Madison, secretary of the association, on "Why Tile Sometimes Fail," was very interesting to the farmer interested in this question. Mr. Jones cited the experiences of many farmers who had tiled their wet lands, discussed the advantages of the open ditch and in addition to estimating costs of tiling pointed out the necessity of doing the work properly.

Mr. Jones explained that wrong ideas prevail as to the cost of tile. Benefits more than offset costs. It has been estimated that were the two and a half million acres of marsh lands reclaimed and the three and a half million acres of wet clays, some now under the plow, drained that the profit above cost in increased value of the lands would be at least $114,000,000. The total cost of draining the more than seven million acres is estimated at $66,000,000, which would increase the values to $190,000,000, leaving a profit of $114,000,000 on an expenditure of $66,000,000. Of course, this work cannot be done in a day or a year, but were it possible to do it the above figures would represent the profit. Wisconsin, it was also pointed out, has been slow to realize the benefits of drainage as compared with other states. Illinois has reclaimed all except 900,000 acres of its 4,500,000 acres of swamp; Iowa has reclaimed about half its swamp lands and Ohio and Indiana have done equally as good work as Illinois. In Wisconsin's fifty drainage districts about 580,000 acres of swamp lands have been or are being reclaimed at a cost of about $3,000,000.

A four-inch tile laid three feet deep in a soil where the digging is reasonably easy costs 75 cents a rod for tile and labor, Mr. Jones explained. An eight-inch tile laid four feet deep costs about $2 a rod. If the laterals are four rods apart forty rods are required to the acre and the cost of the laterals is $30 an acre. An eight-inch tile with a fall of a tenth of a foot in a hundred will usually serve as an outlet for the entire under drainage from forty acres and the cost of this outlet, distributed over the entire area, may amount to $3 or $4 an acre. This added to the cost of the laterals, under ordinary conditions, makes the cost of tile in clay soils less than $35 an acre. To this may have to be added the inconvenience of boarding the laborers,

FARM MECHANICS

Auto, Farm Engine and Farm Machinery Ailments diagnosed and remedies suggested in this department

QUESTIONS AND ANSWERS.

Horn Operated by Magneto.

I have a horn on my Ford car operated by five dry cells. Could I arrange it to be operated by the Ford magneto?

Answer.—If your horn is of the vibrator type, probably yes; if it is of the revolving armature type, no. If your horn is of the vibrator type ground one terminal. Run the other terminal to the horn switch button and from the opposite switch button terminal to the magneto terminal.

Using Water With Kerosene.

My two-horse-power engine has a No. 9 Maxwell carburetor and uses kerosene for fuel. I would like to know how and where to put on a pipe so as to have hot water mixed with the kerosene. What size pipe shall I use?

Answer.—If your carburetor is intended for using water it will have a connection for a water pipe. If it is not designed to use water we doubt that you could arrange it to do satisfactorily. If you wish to experiment you might run a one-fourth inch copper pipe from your water tank to the exhaust pipe, make several turns with it around the exhaust pipe and then run the pipe to the intake manifold just above the carburetor. Make the connection at the water tank by drilling and tapping a one-eighth inch pipe tap hole in the tank; screw in a pet cock having a one-fourth inch copper pipe union at the outer end. To make the connection at the intake drill a one-fourth inch hole at the proper place, insert the pipe, bend it upward in the intake and mash the end nearly flat, so that the water will come out as a spray. Then solder the pipe to the intake, making a strong, air-tight joint. Regulate the amount of water by the pet cock.

Building a Tractor.

I would like your idea on building a tractor out of an eight-horse-power gasoline engine that is already team portable. Would this engine have traction enough to pull a plow? What would be its actual traction or pulling power? How could I transmit the power from the crank shaft when the clutch pulley takes up all the room on one side, and on the other side the shaft extends only one and one-half inches past the flywheel? Must the power be taken from the crank shaft, or could it be taken from the engine flywheel? If this engine would be too light for plowing, I would be satisfied by its being able to pull itself. I intend to use binder bullwheels for the rear, using the wheels already on for the front. How large a wheel could I use in front so as not to be geared too high for chain drive? Would I have to have a clutch? I would like to have your idea and the ideas of others on my plan.

Answer.—Your tractor would have plenty of power to pull itself and under favorable conditions would pull a twelve-inch plow. It might even pull a fourteen-inch plow. The drawbar horse power would not be much over four. The drawbar pull would be about 750 pounds at two miles per hour if your tractor weighs 1,500 pounds, about the correct weight for eight horse power. If geared to four miles per hour your drawbar pull would be only 375 pounds.

A good arrangement for the drive would be as follows: Mount a fifteen-tooth sprocket for roller chain on the crankshaft. One and one-half inches will hold it all right if the key is well fit. Use chain having a roller three-fourths of an inch long and three-fourths of an inch in diameter. Mount a jack shaft near the engine and drive this shaft from the engine, using a large sprocket equipped with a friction clutch on the jack shaft. On this shaft should be mounted a sliding gear driven by a strong key. Back of the jack shaft should be mounted the differential shaft, the differential being mounted at the middle of the shaft and small drive sprockets or pinions at the ends. On the differential case should be mounted two gears, one large and one somewhat smaller. The large gear should mesh with the sliding pinion on the jack shaft when in forward gear. Under and somewhat back of the jack shaft should be placed the reverse shaft. This shaft has one gear on it. This gear meshes with the smaller gear on the differential case. It must also mesh with the sliding gear when the sliding gear is shifted from forward to reverse position. There should be a neutral space between when the sliding gear is entirely out of mesh.

You should have a clutch, as stated above. We would not advise you to connect to the flywheel.

Ice in Water Jacket.

I have let the water freeze in the lower part of my water jacket area of my auto engine, and now I cannot crank the engine. Will the freezing ruin my engine? That is, will the ice crack the cylinders? How can I thaw this ice out? Where can I obtain literature on the care of storage batteries? Does the U. S. Department of Agriculture issue any bulletins on this subject?

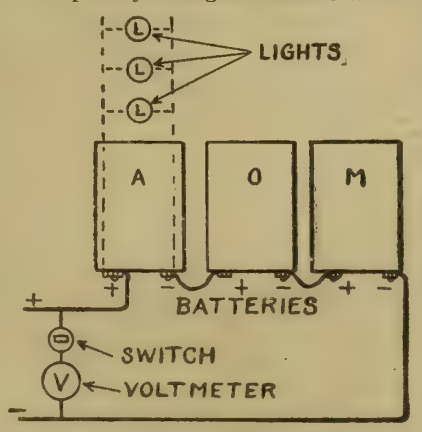
Answer.—If your engine has a water pump the water has frozen in it. This is what prevents you from cranking the engine. It may or may not be that your cylinders are cracked. Usually the inside of the cylinder does not crack, only the water jacket, which may be soldered or welded by the acetylene process. To solder a cracked water jacket file a V-shaped groove along the crack. Keep this groove free from grease or dirt and coat it with a solution of copper sulphate. This leaves a thin copper plate on the iron. Then solder up the crack, using ordinary soldering fluid. The copper plate makes the solder stick to the iron easily. To melt the ice pour boiling water into water pump.

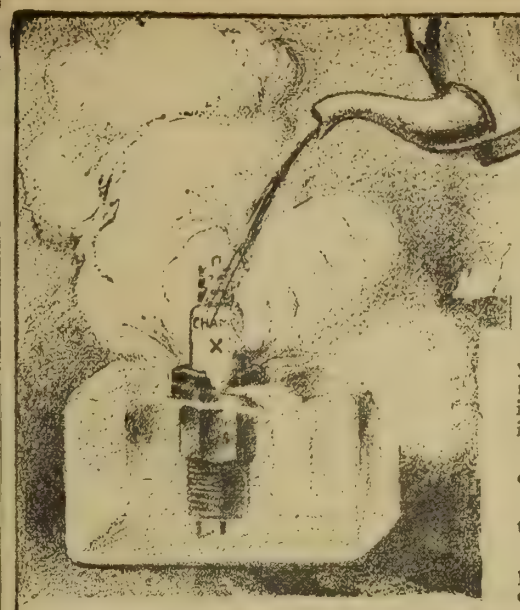
We have not seen any bulletin on storage batteries issued by the government. Any storage battery company will furnish you instructions. If you have access to a city library you can find considerable storage battery information in the I. C. S. reference books.

Charging Storage Batteries.

I have a 30-volt light plant. The generator is three-fourths kilowatt, 50-volt, direct current. How can I put on an ammeter to tell when the battery is fully charged? What is the voltage and amperage of the battery when fully charged? How could I connect an Overland and a Metz automobile battery to charge them with this outfit? Can I charge them all at the same time, or will I have to charge only one at a time?

Answer.—To tell when your battery is completely charged connect a voltmeter in the circuit as shown in the figure. Some voltmeters register only when a button is pressed. If you have one of that kind the switch is not required. When fully charged your battery will furnish 2.4 to 2.7 volts per cell, depending upon charging conditions. It should never be discharged below 1.7 volts per cell. Take the voltage reading while current is flowing from the battery. Voltage readings are not reliable when the battery is idle. To charge your other batteries you can connect them in series with your lighting battery unless the combined voltage exceeds 45 volts, your generator furnishing 50 volts. In case the combined voltage is too high you can charge the two automobile batteries by replacing battery A by a bank of lamps connected in parallel, as shown by the dotted lines. Use eight fifty-volt, fifty-watt lights in the bank. The safe discharge rate for a battery is about one-tenth of its ampere-hour rating.





This Illustrates What Happens When You Start A Cold Motor

When you "light the gas" under your cold spark plugs the effect is much the same as if you poured boiling water on a spark plug half buried in a cake of ice.

Unless the materials are exactly conditioned—

Unless the parts are accurately tooled and fitted—

Unless the contact points are properly cushioned where the strains come—something is bound to break.

If you would have absolutely reliable service, under all the varying strains of temperature, speed and load, see that your motor is equipped with

Champion

"TOLEDO MADE FOR THE WHOLE WORLD'S TRADE"

Dependable Spark Plugs

Every detail of their construction makes for endurance and dependability.

But to make them dependable we go to extremes of engineering and of processing which you would never dream of.

These extremes are practical only because such cost is distributed over such an enormous production.

Year after year our output has been greater than that of all other makes of spark plugs combined.

This season our output is *doubled* compared with last.

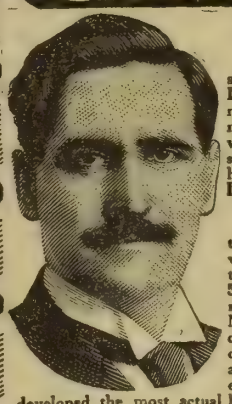
The spark plug which we designed to serve your motor we know, by actual comparative tests will serve that particular kind of motor with greater efficiency than any other kind of plug you can buy.

Your dealer knows which one it is and will gladly supply you.

Be sure the name "Champion" is on the porcelain—not merely on the box.

Champion Spark Plug Co., 503 Avondale Ave., Toledo, O.

GALLOWAY'S 1916 ENGINE CHALLENGE! READ IT!



EVERY ENGINE BUYER NOW PROTECTED!

Not one of the advertisers or manufacturers of light weight, high speeded, small bore and short stroke engines dare accept this challenge. I mean it particularly for advertisers of over-rated engines so that they may be compared with my 1916 Masterpiece Big Six engine. Let any manufacturer of an engine rated at 6 h. p. or more which is lighter in weight than the Galloway Masterpiece Big Six, of smaller bore and shorter stroke and speeded up to a greater number of revolutions per minute, send his engine to the mechanical department of any state college in the union; I will send a Galloway Masterpiece Big Six to test on the block beside it for:

READ THESE CONDITIONS:

1. A 24 hour sustained brake test. 2. A 30 day (24h ours each) continued heavy load test, each engine pulling the same load. 3. A test for vibration, each engine mounted on the same kind of base. 4. A cooling test to determine which engine requires the least attention to keep cool. 5. Actual brake horse power of each engine when speeded up to the same number of revolutions per minute, whether fast or slow; speeding up the Masterpiece Big Six to any other engine's speed, or speeding down any competing engine to the same speed as the Galloway. When the test is over the mechanical department of the college to publish their comparisons, and determine: 1. Which engine pulled its load with the least vibration, easiest and steadiest. 2. Which engine cooled the best. 3. Which engine developed the most actual brake horse power at the same speed. 4. Actual horse power of each engine just as it comes from the crate, no expert or representative of any manufacturer to be in the testing room. 5. Which engine had the greatest surplus power over the rated and advertised capacity. 6. A comparison in writing by said mechanical engineers of all engines determining which one is the simplest in design, most perfect in operation, and which in their opinion is the best for long, hard, continuous, heavy day in and day out. engine service.

GET MY 1916 PRICES

DON'T GET FOOLED and let the one dollar less asked for engines similar to the Galloway get so close to your eye that it hides the difference in quality between the Galloway Masterpiece Big Six and its competitors. My new low 1916 prices and selling plans make it easier to own an engine than ever. My new big 250 page catalog in 4 colors describes these selling plans and every style portable or stationary from 1¾ to 16 h. p. It is free. Engines shipped from Waterloo, Kansas City, Council Bluffs, St. Paul and Spokane.

ENGINE $26.75 UP

Model Creamery at Elk Mound.

Old Structure, Destroyed by Fire, Replaced by a Plant Modern in Every Respect and a Credit to Wisconsin.

ELK MOUND, Dunn county, in the erection of its new creamery, which was dedicated recently, has set an example for scores of other communities, for this new creamery ranks with the best in the state and is modern in every particular.

Wisconsin is in need of more creameries like the new Elk Mound creamery, for here the buttermaker will be able to produce the highest product under most ideal surroundings. Next in importance to securing good milk and cream from the farmers is the necessity of a good, sanitary place in which to make this raw product into the finished product. Such a place has been provided at Elk Mound.

The new creamery building is the result of a fire last spring which destroyed the old building and in planning the present structure every effort was made to erect a plant as modern as money could make it. Particular attention is called to the light in the plant, as indicated by the many large windows. Sunshine is one of the best disinfectants and the buttermaking room is flooded with abundant light. The equipment is all modern, the entire plant a model of sanitation and cleanliness and those communities which are considering erecting new creamery buildings can well afford to send representatives to visit the Elk Mound creamery.

The old building was destroyed by fire on May 27th and shortly after a meeting of the stockholders of the Elk Mound Creamery Company was held, at which it was unanimously agreed that the corporation should dissolve, but should continue in active control until a new company should be organized.

A committee was appointed to formulate a constitution and by-laws for the new organization which came into existence as the Elk Mound Co-operative Creamery Association, with a capitalization of $10,000, divided into 400 shares at $25 per share. Up to the present time 210 stockholders have bought 336 shares, bringing into the treasury $8,400. One of the rules of the new organization is that no individual shall own more than four shares of stock, and that each shareholder shall have only one vote, regardless of the number of shares owned by him.

Outside dimensions are 38x76 feet. At the east end is a covered drive ten feet wide, with arched openings. In the east end of the building proper is the intake room, 26x20x9 feet and the office, 20x10x9 feet. Descending a few steps from the intake room, the main floor is reached where the churning is done. This is 36x34x14 feet. From this room the cold storage opens, 10x16x8 feet, and the remaining floor space, 26x16 feet, is occupied by the boiler room, fuel room and bath. An attic extends over this entire space and a storage room 36x20x8 feet is under the office and intake.

In the work room are two 600-gallon cream ripening vats equipped with agitators of 1,000 pounds' capacity, a gearless combined churn and butterworker. A 600-gallon buttermilk tank is in the attic. Buttermilk, the only by-product, is sold by yearly contract to individuals. Pasteurization has not yet been practiced, but preparation has been made to carry it on whenever necessary.

A seven and one-half horse power electric motor operates the plant, at a minimum of expense and the maximum of convenience.

Hot and cold water is supplied to all parts of the building and in addition to a fine bathroom there is a shower bath with hot and cold water connections for the employes. Including plans, specifications, structure and equipment the total expense was in the neighborhood of $13,000.

The new building is situated on the old site. It is of fireproof construction and designed for practical utility, both now and for the years to come, unpretentious architecturally. The exterior is of sand mold and veneer brick, their color of soft dark red affording a pleasing contrast to the black mortar in which they are laid.

Back of this veneer is a lining of common red brick, which is backed by five-inch hollow tile with three air spaces. The interior wall finish is of two coats of cement plaster, with three coats of white dairy enamel. The steel window sash, inner and outer doors and ceilings are all of the same glistening whiteness and all pipes and radiators are coated with aluminum bronze.

The officers of the association are: President, E. C. Jacobs; secretary, M. T. Jenson; treasurer, William Siedenberg. Allan Dickson and J. W. Meyer, together with the officers, constitute the board of directors.

Chicago is the market for the greater part of the product, although an occasional shipment is made to New York and Philadelphia. One and one-fourth tons are taken each month by the local dealers and the patrons on the several routes. This amount is made into pound prints, all the rest being packed in sixty-pound tubs.

During the first three months that the creamery has been in operation under the new management there was received 350,796 pounds of cream, which yielded 97,616 pounds of butter fat. This was converted into 113,544 pounds of butter, which sold for $29,049.32. Cash paid to 267 patrons, including butter sold to them, $26,209.54.

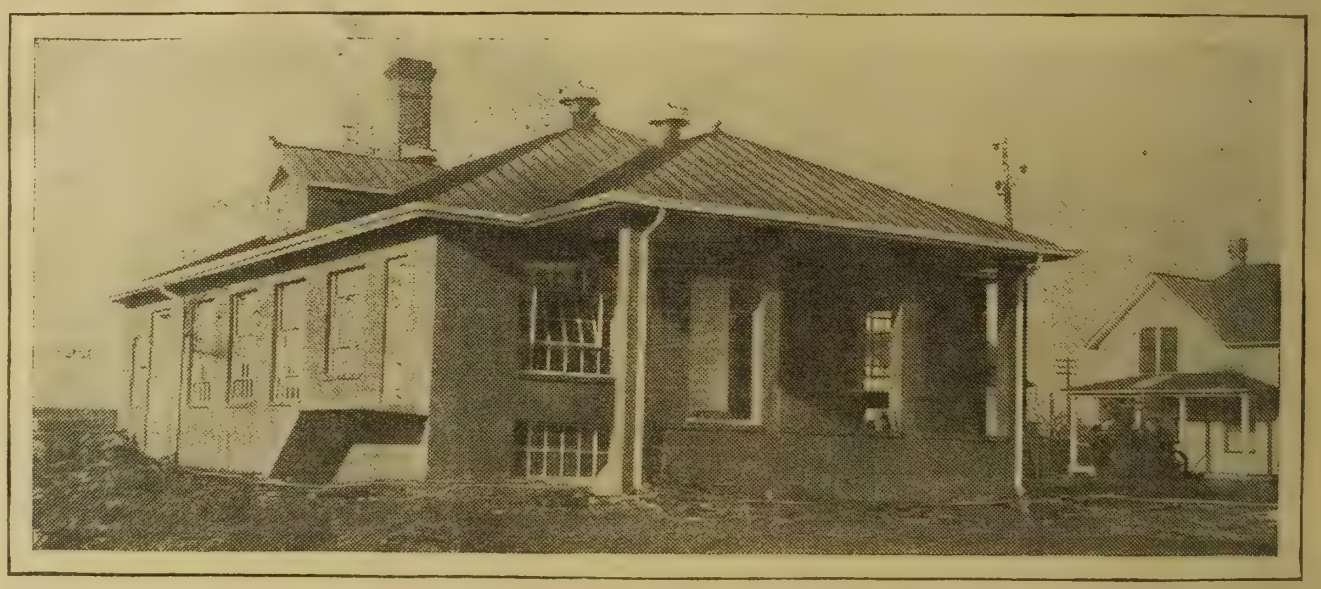
A phenomenal growth in the business of the creamery has taken place in the comparatively short period of three years. For instance, the number of patrons three years ago was 135, while at present there are 267.

Three years ago the number of tubs of butter per week was forty in winter and 115 in summer. The present output is 100 tubs per week in winter and 200 in summer.

The farm separator system has been in operation for many years and five wagons collect and deliver the cream three times weekly during the summer months and three take care of the business in winter, when the volume is smaller and conditions for keeping the cream a longer period are more favorable. Cream is gathered from a radius of seven miles.

The organization of the Elk Mound Creamery Company dates back more than a score of years. Henry Ausman, Sr., was the first president and W. A. Mau secretary and treasurer. Mr. Mau was also the first buttermaker.

The Elk Mound creamery was first started in the spring of 1895 and on August 10th of that year the first delivery of whole milk, 641 pounds, was made. This produced twenty-four pounds of butter which was sold for 12 cents a pound. At the end of the first six years the delivery of milk had increased until it run as high as 15,600 pounds daily. In one year, when the change was made from the delivery of whole milk to the Moody system of farm separation, 134 separators were purchased by patrons of the creamery. Theodore J. Hass is the present buttermaker.



NEW CREAMERY AT ELK MOUND, DUNN COUNTY, WHICH WAS BUILT AND EQUIPPED AT A COST OF ABOUT $13,000. WISCONSIN NEEDS MORE CREAMERY BUILDINGS LIKE THIS BUILDING.

THE BREEDS ARE PROSPERING.

(Continued from page 13.)

state fair sheep show. Through its action a prize fund amounting to about $500 for Wisconsin-bred sheep at the last state fair was raised. In thus encouraging breeders to show at their own fairs a stimulus is given for further endeavor along similar lines.

There should be more sheep on Wisconsin farms. One of the greatest hindrances to the small-farm flock is the dog problem. Better legislation is needed.

The coming meeting of the Sheep Breeders' Association should be full of interest to all Wisconsin shepherds. Mr. R. J. Stone, from Illinois, a breeder of thirty years' experience, is expected to address the meeting. Remember the date and place.

Arthur Broughton, of Albany, is president of the sheep breeders.

Horse Situation Good.

The Wisconsin Horse Breeders' Association, which was organized February 15, 1906, is doing a great work for the horse-breeding industry and the year 1915 proved one of the best in the history of the organization. The demand for good, sound stock is very active and the horse breeders of the state anticipate a very prosperous coming twelve months.

The association during the year inaugurated the sale which was held in the live stock pavilion at the college of agriculture last fall and was so successful that this sale will be made an annual event. To this sale the members consign animals and it should become in a short time one of the big events in this part of the country. It is also being planned now to hold a horse show at Madison in March.

The Wisconsin Horse Breeders' Association solicits for membership and co-operation all interested in the betterment of the industry in the state and all breeders are urged to attend the annual meeting, which will be held February 10th at Madison. J. G. Fuller is secretary.

Praise for the Angus.

Wm. A. Connell, secretary of the Wisconsin Aberdeen Angus Breeders' Association, contends that from the standpoint of the beef-raising industry of Wisconsin that Aberdeen Angus cattle are best suited for this purpose. It is the breed, he believes, most economically adapted to Wisconsin. Park Gelbach, of Lancaster, is president of the association, which will also hold its annual meeting in Madison on February 10th.

The past year has been entirely satisfactory to this breed and more men are becoming interested each year in the Angus breed. The average Wisconsin farm is small and pasture is scarce. This breed is well suited to feed-lot conditions and does well on such, as they are of a quiet, gentle disposition and easily kept. Cattle of this breed mature young and make excellent baby beef, their weight being from 900 to 1,300 pounds at this period. They eat grain while on milk, so are ready for the market at from one year to eighteen months of age. This method of raising cattle shows a very small cost of production.

With the Guernsey Breeders.

The Western Guernsey Breeders' Association was organized February 14, 1900, during the meeting of the Wisconsin State Dairymen's Association at Watertown, Wisconsin. The association started with twenty-five charter members, all of whom were Wisconsin breeders except Prof. T. L. Haecker, University of Minnesota.

This association has held an annual meeting every February since that time and at least one summer meeting at the farm home of some breeder. The association has done much to encourage breeding of Guernseys by the offer of prizes at state fairs and national dairy shows, the conducting of essay contests and in aiding in the organization of local and county associations.

At several of the summer meetings scoring contests have been carried on and have always had for all their meetings the very best speakers to be obtained.

The association has now 150 annual members, fifty-five life members and fourteen honorary members from ten states.

The influence of this association has had much to do with the upbuilding of Guernsey breed interests in the middle West.

EXPERIMENT ASSOCIATION AND ALFALFA ORDER.

Wisconsin grain growers and those who raise alfalfa will find their interest in farmers' week at Madison centered in the programs Friday and Saturday, February 12th and 13th. On these days occur the meetings of the Wisconsin Agricultural Experiment Association and the Wisconsin Alfalfa Order. The annual grain show will be held in the live stock pavilion at the college of agriculture. The Wisconsin exhibit at the Panama-Pacific Exposition will be reproduced.

Sec. R. A. Moore, of the experiment association, and L. F. Graber, of the alfalfa order, have announced programs as follows:

The program for these two days, which has just been announced by R. A. Moore, secretary of the experiment association, and L. F. Graber, secretary of the alfalfa order, follows:

FRIDAY, FEBRUARY 11TH, 8 A. M.

Annual address of president—Henry Michels, Malone.

Secretary's report—Testing Seed Corn and Treatment of Seed Grains—R. A. Moore, Madison.

The Seed Corn Situation from the Practical Farmer's Standpoint—W. H. Hanchett, Sparta.

Young People's Agricultural Clubs and Why the Association Should Lend a Helping Hand—T. L. Bewick, Madison, State Leader Boys and Girls' Club Work.

Growing and Preparing Grains for Exhibition—H. T. Draheim, Gotham, winner of largest number of first prizes at last year's grain show.

Our State and County Fairs—Hon. C. P. Norgord, Madison, Commissioner of Agriculture.

Address—Science and the Soil—Prof. H. G. Bell, Chicago, Agronomist Middle West Social Imp. Committee.

Certification of Seed Potatoes—Prof. J. G. Milward, Madison, secretary Wisconsin Potato Growers' Assn.

The Drying of Potatoes—Dr. H. E. Horton, Washington, D. C., American Steel & Wire Co., Chicago.

ALFALFA ORDER, 1:30 P. M.

President's address—Jas. B. Cheesman, Racine.

Secretary's report—L. F. Graber, Madison.

Alfalfa From the Railroad Man's Viewpoint—A. C. Johnson, Traffic Mgr., C. & N. W. Ry. Co., Chicago.

Alfalfa on Every Farm—P. G. Holden, Director Agr. Extension, I. H. C., Chicago.

Motion pictures on alfalfa growing in Wisconsin.

AUDITORIUM, AGRICULTURAL HALL FRIDAY, 7:30 P. M.

Joint session of the experiment association farmers' course with short and long course literary societies.

Music—Agricultural Orchestra.

Address of welcome—Dean H. L. Russell.

Address—Adda F. Howie.

Music—Agricultural Orchestra.

Recognition exercises.

Music—Agricultural Orchestra.

AUDITORIUM, AGRICULTURAL HALL SATURDAY, FEBRUARY 12TH, 8:30 P. M.

Business meeting of the experiment association.

Reports of committees and election of officers.

Sudan Grass in Wisconsin—Prof. Geo. B. Mortimer, Madison.

Report on Association's Co-operative Experimental Work—J. J Garland, Assistant to Secretary, Madison.

Soil Management for Seed Corn Production—Noyes Raessler, Beloit.

Agricultural Opportunities in Wisconsin—Ben Faast, Eau Claire.

Uniting Country and City Efforts—Hon. Burt Williams, Madison.

Secretary Moore wishes it known that any farmer can exhibit at the grain show and that it is not required that he be a member of the experiment association to compete. The only requirement from nonmembers is a 25-cent entry fee for each sample exhibited.

As the grain show must be put up and judged before the farmers' course begins all grains must be in Madison by Thursday morning, February 3d. The prize list is especially attractive this year and may be secured from the secretary.

The officers of the alfalfa order are:

President—Jas. B. Cheesman, Racine, Wis.

Vice president—Ex-Gov. W. D. Hoard, Ft. Atkinson, Wis.

Secretary—L. F. Graber, Madison, Wis.

The officers of the experiment association are:

President—Henry Michels, Malone.

Vice president—J. R. Thorpe, Tavera.

Secretary—Ransom A. Moore, Madison.

Asst. to the Secy.—J. J. Garland, Madison.

Treasurer—Henry E. Krueger, Beaver Dam.

Clerk and Stenographer—Clara Brabant.

Executive Committee—Geo. W. Davies, North Freedom; J. R. Thorpe, Tavera; A. L. Stone, Madison; Frank Bell, Columbus; Jesse Van Natta, Dodgeville; Officers of Association, Ex-Officio.

Whether You Build or Remodel

JAMES Barn Plan Service will start you right and keep you going right. Whether you do the work yourself or hire a builder, this service, which is a great feature of the new book, "The JAMESWAY," will be a wonderful help and profit to you. Tells what the barn owner needs to know about location, drainage, lighting, ventilation, equipping, etc. It will *save* you money and *make* you money. Written by W. D. James and his expert associates—originators of sanitary barn equipment ideas.

JAMES Sanitary Barn Equipment

in a barn built the Jamesway means bigger results with less labor. Notwithstanding its reputation and superior quality, it is reasonably priced. Stalls as low as $4.25 each. An ideal stall to begin with is the one for $5.25, with the same quality and construction of the complete feature-equipped stalls. The only difference between JAMES stalls of different prices is in some of the special features which are added to the higher-priced stalls.

The JAMES line includes Stalls, Stanchions, Pens, Carriers, Ventilators, Trucks, Watering Buckets, etc. To get a free copy of "The JAMESWAY" just fill out the coupon aud mail it at once.

POULTRY

THIS department is edited by a competent poultryman, who will be pleased to answer questions concerning diseases, poultry management, etc., when they can be answered through the department. Questions will not, however, as a rule, be answered by mail, and stamps need not, therefore, be inclosed with inquiries. Address all letters relating to poultry topics to this office.

FROM A DANE COUNTY BREEDER.

To the Editor:—I have done a good real to improve poultry in Wisconsin and other states. I am breeding the utility Barred Rocks, large birds and good layers. We keep about 400 birds. Sold 9,000 eggs for hatching this year, also will sell about fifty cockerels this winter for breeding. We have 100 Rouen ducks, some Pearl guineas and Poland China hogs.

As regards feeding for eggs in winter, first you must have early-hatched pullets from strong, vigorous stock, well fed through the summer. When it comes cold make them work. Take some bundles of wheat, scatter them on the floor and some scratch feed in the morning. At noon fill self-feeders with ground oats, corn and bran. At night feed Yellow Dent corn. It makes a good egg. You must have a farm house and good yard, water, grit, oyster shell, slaked lime, wood ashes, second crop clover or alfalfa once a week, boiled potatoes, boiled oats, lard scraps pounded fine on a plank floor. When it is warm enough open the door and let the sun shine on them. There are lots of things that can be done.

Do I believe in open-air poultry house? No, I like a warm house, facing the south, some windows and large doors to open to let the sunshine in. I like a scratching shed, open front and a curtain to let down.

How to keep your poultry houses free from lice and mites: For mites I have my roosts hung on hinges, tied up with ropes at the other end. I raise them up and whitewash with hot, thin lime and sprinkle dry lime on the floor. For lice I have a box with hard coal ashes for the hens to dust in. When hatched with hens the lice go onto the little chickens. I have a recipe that will kill the lice on little chicks when two days old and not hurt them. (Meaning painless death for the lice.)

I have had a few cases of roup. The ax is the only cure I can find. I clean out the poultry houses and scatter lime around, scald out the drinking dishes and put permanganate of potash in the drinking water twice a week for a while.

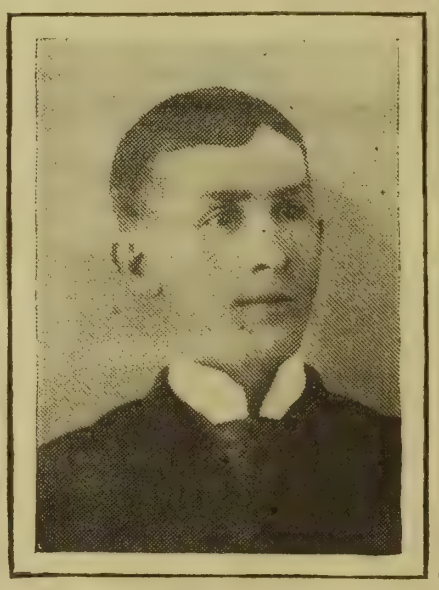
After the breeding season is over I pen my roosters up, then I sell eggs that will keep for winter packing for 2 to 5 cents a dozen more than the stores pay. Wm. Davenport.

Dane Co., Wisconsin.

APPROVES OPEN AIR HOUSING.

To the Editor:—We breed Barred Rocks and waterfowl. At the last Wisconsin fair we exhibited ten waterfowl, four Toulouse geese and six Pekin ducks and won eight ribbons out of the ten entries, three firsts, two seconds, one third and two fourths. We regret very much that we haven't some photographs of our stock to send The Wisconsin Farmer.

In feeding for winter eggs we find we get the best results from feeding a small feed of oats and wheat in litter, so that the chicks will get sufficient exercise early in the morning when they first leave the perch. We



FRED KRINKEY, ROCK COUNTY.
A successful Buff Orpington breeder.

scatter their morning feed in the litter the night before after the birds have gone to roost so that it will be there when the birds get up. About eight o'clock, or as soon as the birds have cleaned up the oats and wheat feed, a warm mash consisting of bran, corn meal, beef scrap and alfalfa meal, a little oil meal in the mash once a week is good. Feed plenty of greens. Sprouted oats is an excellent green food for laying hens. Feed the green oats at noon. Feed a good feed of whole grain in the evening, consisting of wheat, oats, barley and a little corn. Feed corn sparingly to laying hens or the hens will get fat and lazy. Serious results will come to the overfattened birds; no eggs and a loss of feed.

We do most strongly approve of the open air system of housing. It is natural that the birds should live out in the open air. So have an open front in the poultry house with a curtain in front which can be dropped on cold and stormy weather and raised on bright days so as to let in all the sunlight and fresh air you can. The housing of poultry is one of the biggest stumbling blocks in the poultry business.

To rid the birds from lice keep the house clean. Spray with a strong solution of daytholeum and water, paint the roosts with a wash made of kerosene and carbolic acid. Wood ashes placed in a box is good for the birds to dust in.

We have not been troubled with roup and we believe the principal cause to come from bad housing, by this we mean (1) by not keeping the houses clean (2) by not keeping the houses well aired (3) by keeping too many birds in the same house. Disinfect the poultry house and yard thoroughly with a good strong solution of daytholeum and water. If this is done twice a year, once in the spring and again in the fall, the houses kept clean, well aired and not overcrowded, we believe that there will not be any trouble with roup.

Waterford, Wis. Hardie Bros.

SELECTING HENS FOR SETTING.

To the Editor:—We always select two-year-old hens to be used as sitters. Hens of this age make better mothers than pullets. Pullets, as a rule, are more nervous than the older hens. The hen will sit more quietly upon her eggs during the period of incubation; therefore the hatching will be more uniform and also a more successful hatch will be the result.

Pullets that have been producing eggs through the winter will, of course, become broody during the hatching season, but we confine these in slatted coops kept for this purpose, and by feeding and watering them well for a few days their desire for setting will vanish and in a short time they will be laying again.

We prefer hatching out the greater part of our chicks during the months of February and March. The pullets from these hatches are kept, which make our winter layers. The roosters are sold when weighing two pounds, and for these we secure the top prices.

We prefer sound, hard-shelled eggs of uniform size for hatching, and those from the older hens give the best results. We prefer setting as many as eight or ten hens at the same time so that the chicks will all be of the same age, and there will be no trampling of the younger ones as would be the case if the broods came off at different times. Then, too, the

Ironclad TRADE MARK
Wins in the Two BIGGEST HATCHING Contests Ever Held

Why take chances with untried machines when for only $10 we guarantee to deliver safely, all freight charges paid (East of Rockies) BOTH of these big prize winning machines fully equipped, set up ready for use! Why not own an Ironclad — the incubator that has for two years in succession won in the greatest hatching contests ever held. In the last contest conducted by Missouri Valley farmer and Nebraska Farm Journal, 2000 machines were entered, including practically every make, style and price. With 140 egg Ironclad—the same machine we offer with Brooder, freight paid, for only $10, Mrs. C. F. Merrick, Lockney, Texas, hatched 148 chicks from 148 eggs in the last contest.

140-EGG Ironclad Incubator
Don't class this big, all metal covered, dependable hatcher with cheaply constructed machines. Ironclads are not covered with cheap tin or other thin metal and painted like some do to cover up poor quality of material. Ironclads are shipped in the natural color—you can see exactly what you are getting. Don't buy any incubator until you know what it is made of. Note these Ironclad specifications. Genuine California Redwood, triple walls, asbestos lining, galvanized iron covering. Large egg tray, extra deep chick nursery—hot water tank, copper tanks and boiler, self regulator, Tycos Thermometer, glass in door and many other special advantages fully explained in Free Catalog. Write for it TODAY or order direct from this advertisement.

W. A. WEBER, Box 905, Mankato, Minn.

feeding is more easily done when all the youngsters come off at once.

We make warm, soft nests for the hens that are to hatch our early chicks. We feed them well during the period of incubation so that they will be in good condition when bringing off their brood. When the hatch is over we remove the hens and chicks to individual brood coops made to set a few inches above the surrounding surface to insure perfect dryiness, and there is nothing so harmful as dampness to the early broods. The coops are made wind and waterproof by lining them inside with tarred paper. Trenches are dug around the coops and the dirt is banked outside so that all water during a rainy spell will run away from them. The coops are also movable so that the floor underneath can be frequently cleaned.

Chicks like to scratch among leaves and we bring a supply from the woods and place them upon the floor. Thus they get all the exercise needed when so confined.

The chicks are fed in coops made of slats, which prevents the hens getting a greater part of the food. The hens, also the chicks, are examined carefully for lice. If any signs are seen we grease the hens under the wings and breast with lard and put a wee bit upon the chicks' heads. We never allow the hens and chicks outside during rainy weather, but remove them to a slatted shed built at one side of the hen house.

We feed the young chicks sparingly at first—increasing their rations as their digestive organs gain strength to properly digest the amount given. We feed chopped corn and wheat after the chicks are two weeks old. Their diet at first is dried bread crumbs. Plenty of water is before them at all times, also pulverized charcoal and sand, to keep their digestive organs in good working condition. The hens are fed liberally upon whole corn or wheat while mothering their broods. S. E. M.

IMPORTANT PLACE OF INCUBATOR AS WELL AS HEN HATCHING.

To the Editor:—I have had abundant experience with different makes of incubators. I like the machine method. It is all right. It is scientific and very trustworthy; so, also, is the old plan of natural incubation. Both methods of hatching have features worthy of our attention and adoption, but it depends on what is wanted and when and how to bring about the desired end.

I am not rejecting either method; neither do I expect to discard either. I find a fixed and worthy place for both. My plan is to employ both methods, but to hatch chickens for certain purposes at certain seasons of the year. For instance, I find the use of the incubator through the months of January and February, with the accompanying brooders, indispensable for hatching and brooding chicks for broilers—the males, chiefly, and stock from which to make my layers of eggs the following winter.

It is a well-known fact that it is not before in March, and generally during April, that there are any broody hens worth mentioning. This precludes the possibility of hatching and growing chickens for broilers, or from which to get extra early pullets for dependable winter layers. Late-hatched chickens cannot be expected, as a rule, to lay eggs the first winter, hence the desire for quite early ones.

Taking up now a peculiar plan of hatching chickens, as it were, by wholesale, which I accidentally discovered some years ago, I will describe the method. It will pay anyone to give it a fair trial. Remember, it does not do away with incubators or brooders, but for all medium to late hatches of chickens it is the finest arrangement imaginable and there is but little extra expense to get ready for operations. Extra room is all that is needed.

The way I made my discovery is like this. I had that spring some ten dozen hens of good, but somewhat mixed stock. They had the run of three connected houses, each 12x15 feet square, all provided with good box nests and roosts. It so happened that most of the hens made one of the rooms their roosting place. Consequently, when the weather warmed up and egg laying began in earnest the most of the eggs were deposited in the nests in the room where most of the flock roosted. This was perfectly natural and I made no effort to change it for the time being. Each evening I gathered the eggs—nearly 100—so as to keep them perfectly fresh for sale, use or some of the choicest for setting purposes.

After laying had gone on rapidly for some time I noticed one evening that quite a number showed signs of being broody. A new idea struck me, namely, that there was soon going to be a chance to set a dozen or more of them at one time. Then it occurred to me, also, that it would be possible to not only set a big lot of the hens at one time, but they could then be shut up so no laying hens could bother them through the period of incubation.

Well, to make a long story short, one evening when gathering the eggs I counted fifteen broody hens on the nests. Having plenty of fresh, fertile eggs on hand, just after dark I proceeded to set them. I gave each one fourteen eggs. The hens that had gone on the roosts I put out and the following morning I placed in the apartment a vessel of water and a liberal supply of mixed corn and wheat was put in a broad, shallow box for them to eat.

During the three weeks they sat they came off and went on their nests at will and during all that time (I looked in twice and three times a day) I only had to enter once to do any regulating. That time I found two of the hens had gone on the same nest. When they desired to do so they would leave the nests and after eating, drinking and stretching their wings a little, went back in good order. Not every time did each hen get on the nest she left, but any nest showing no occupant seemed satisfactory. So this changing resulted in no apparent ill, except the case I have named, and that did no harm. There were more than 200 eggs being set on in the very best way, and I have at no time found one of the mechanical devices giving as little care or trouble, even if the hatching was satisfactory.

It was only a little more than two weeks until in the adjoining house or room I set twelve more. I arranged them the same as I did those in the first room, namely, shut out all laying hens and provided them with water and feed. They hatched 140 chicks and I placed them with mothers like I did the first lot.

It is noticed that when I had the two rooms occupied with setting hens there was the third one left for hens still laying to enter, and there was still a good roosting place. This is the reason, if anyone wants to imitate what I have done, that he should construct three-room houses, or put high wire partitions in any extra large house already possessed.

I could have repeated the operation and hatched a similar number of chickens, but I wanted no more until late summer time, so I stopped proceedings. Since that time I have had little trouble with sitting hens through the regular hatching season. With sufficient brooders for mothering the young chicks I could have dispensed with the hens, but I find if the hens have the care of good-sized flocks of the young they range out on the premises some distance and get both natural food by hunting and exercise as well, which is very beneficial to them.

In conclusion, I will say to those having good numbers of hens and wanting to supplement the use of the incubator and brooder by hatching many chickens in the natural way, they will find the plan I have described exceedingly satisfactory. There may be seasons when more or less failure will result—I have had some bad hatches—but generally there is the best of satisfaction and constant care and worry is largely eliminated.

241 EGG Strain S.C.Buff Orpingtons. 200 cockerels, hens and pullets for sale. Catalog free. Address W. L. Bardsley, Neola, Iowa.

TALK OVER VALUE OF DRAINAGE.

(Continued from page 18.)

hauling the tile and filling the trenches, but Mr. Jones considers these estimates sufficiently high to cover a portion of these inconveniences. Many areas require tile only every eight rods and in deep peat the digging is easy and five-inch tile can be laid four and one-half feet deep at a cost little more than that of laying four-inch tile three feet deep in a clay soil. In many areas, he explained, less tile than this is required for satisfactory drainage.

Mr. Jones referred briefly to farmers who had found it pays to tile. William Kamman, of Manitowoc county, tile drained the wet swales on his 160-acre farm at a cost of less than $500 and now estimates the selling value has been increased at least $2,000. Gilbert Richmond, of Lodi, has made a cornfield by draining where previously he lost every crop and George Carpenter, of Sauk county, contends that tiling is far more satisfactory than open ditches and he has tried both.

Much interest was manifest in the address by F. M. White, of Madison, on "The Adaptability of Tractors to Marsh Land." The tractor is coming into such universal use on the farm now that the owners of swamp lands were anxious to learn the uses of the tractor, which Mr. White outlined:

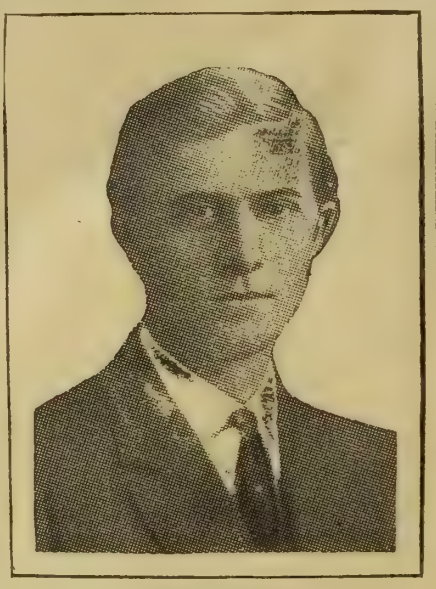
1. Pulling a ditching machine.
2. Pulling small willows, old logs, and stumps and removing them from the field.
3. Pulling a grub breaker and an ordinary plow.
4. Pulling a heavy roller to settle peaty soils.
5. Pulling heavy disks to pulverize the ground after breaking.
6. Pumping water during flood water periods.
7. For hauling tile.

Reclaiming land in this day of machinery is easy compared to ten years ago. The gas engine is a source of power which can be applied to all kinds of work and it seems to be especially adapted as an aid in land reclamations.

Tile ditching, Mr. White explained, is the feasible method of removing underground water and the disinclination of good labor to do this kind of work makes it necessary to adapt mechanical power in ditching. Horse ditching machines require from six to eight horses. A tractor can furnish this amount of power easily and ought to go on the soil where horses would be impracticable. Quite a discussion arose as to how to keep a tractor from miring in the soft soil and Mr. White explained the per square inch pressure of the various types. With either the caterpillar or wheel tractor type, he said, the pressure per square inch was less than that exerted by a horse. Mr. White also went into details as to the value of the tractor for pulling disks, plows, etc., and said that it could be hitched to the pumps at flood time and used in this connection when it otherwise would be standing idle.

Mr. H. W. Ullsperger, attached to the soils division of Wisconsin Agricultural Experiment Association, located at Sturgeon Bay, gave an interesting address on the fertility of marsh soils. We shall have more to say concerning this address in a subsequent issue.

F. W. Lucas, of Madison, discussed drainage specifications; B. M. Vaughn,



E. R. JONES.

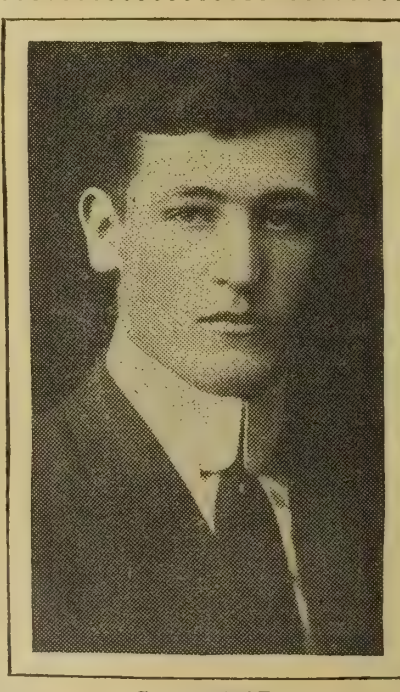
College of agriculture expert on drainage.

of Grand Rapids, reviewed the legislation proposed in 1915, and E. I. Philleo, of Grand Rapids, spoke of peculiar drainage methods in Wood county.

The use of tools, machinery and methods in tile drainage was discussed by J. H. Harness, of Waterloo, Wisconsin, who reviewed this work in some detail. How complete drainage and the use of large tile reduce floods was the subject assigned A. L. Webster, of Wheaton, Illinois, and A. J. Bracken, of Chicago, spoke on dredging from the contractor's standpoint. W. B. Coddington, of Plover, gave an interesting talk on the qualifications of a drainage commissioner and Nye Jordan, of Manson, explained how to keep drainage records. The convention was opened with an address by E. P. Arpen, of Grand Rapids, to which H. H. Sherwood, president, responded.

W. B. Coddington, of Plover, was chosen president for the coming year; B. M. Vaughn, of Grand Rapids, vice president; E. R. Jones, of Madison, secretary, and A. C. Willard, of Necedah, treasurer.

Madison was chosen as the place for the holding of the next annual meeting and Racine was selected for the summer meeting.



C. P. WEST.

New county agricultural representative for Sawyer county, Wisconsin.

STATE HOLSTEIN MEETING.

The Wisconsin Holstein Breeders' Association will hold its next annual meeting at Watertown, Wisconsin, March 2d. On the preceding evening the Holstein breeders and business men of Watertown will give a free banquet to the Holstein breeders. An interesting program is being arranged and a large and enthusiastic meeting is expected.

8 H.P. Portable Saw Rig

2-Cylinder Engine

This Engine alone weighs only 320 lbs. It is one of the famous light-weight Cushmans, for all farm work.

A 3-in-One Outfit

1 Used as a Portable Saw Outfit. Only one horse is required to handle it.

2 Saw may be detached, making it a portable outfit for all kinds of work.

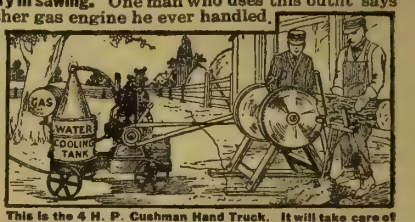
3 Engine is easily removed from the truck, and used for all general purposes.

Here is the successful Light Weight Saw Rig you have been looking for. Weighs only 1285 lbs. One horse easily takes it anywhere. Saw frame of the tilting type. Blades 28 inches. Fitted for pole saw work, when ordered. Where desired, tongue neck yoke and doubletrees will be furnished instead of shafts.

The sensitive Cushman Throttle Governor responds instantly when saw strikes the log, making it stand up and deliver steady, uniform speed, so necessary in sawing. One man who uses this outfit says the Cushman pulls more like a steam engine than any other gas engine he ever handled.

Light Weight Cushman Engines

Are the most useful engines for farm work. Run very quietly and steadily, on account of Throttle Governor and perfect balance. No violent explosions and fast and slow speeds. Very light in weight and easy to move around from job to job. 4 H. P. weighs only 190 lbs.; 8 H. P. only 320 lbs.; 15 H. P. only 780 lbs.; 20 H. P. only 1200 lbs. Cushman Engines are not cheap, but they are cheap in the long run. Engine book free.



This is the 4 H. P. Cushman Hand Truck. It will take care of the sawing needs of most farmers, besides doing all other jobs. Same engine used on binder. Weighs only 190 lbs.

Cushman Motor Works, 855 N. 21st St., Lincoln, Nebr.

UPPER WISCONSIN

AN ASHLAND COUNTY FARM.

The visiting stranger to Ashland county could hardly expect to see in that upper county a finer farm than that at Sanborn, known as "Troutmere Farm" and operated and owned by Theodore Werder. As an editor of The Wisconsin Farmer was touring Ashland county several weeks ago with C. B. Post, county agricultural representative, he observed as the machine was dropping out of the hills into the valley ahead a set of farm buildings which would do justice to

PART OF GUERNSEY HERD OF THEO. WERDER, SANBORN, ASHLAND COUNTY, WISCONSIN.

any of the counties in the southern tier. That was Troutmere Farm, one of the best equipped farms in Ashland county, and located where only a few years ago the lumberjacks were taking out the virgin timber.

Mr. Werder is interested primarily in the breeding of Guernsey cattle and Duroc Jersey swine and his farm has supplied many of the Guernseys which have enabled the settlers in that community to get started properly

THEO. WERDER'S STOCK AT ASHLAND FAIR FROM TROUTMERE FARM.

in the dairy industry. Mr. Werder has been using a pure-bred sire for several years and also has some pure-bred females in his herd of forty head. Dairying is still in its infancy in Ashland county, as the loggers have been gone only a few years and the marks of their visit are still visible in Mr. Werder's neighborhood where the old pine stumps dot the fields that have been cleared, but not stumped, and in other places they are hidden only by the second growth that is waiting for the settler's ax and the match.

The barn shown on this page was recently completed and represents a cost of about $9,000. It is modern in every way and the equal of barns in other dairy sections of the state. It is 36x150 feet, has stanchions for forty cows and at the end there stands two hollow brick silos to afford succulent feed for his cows in the winter. The floors are all of cement, the feed bins equipped with feed chutes, litter carriers, etc. Mr. Werder built for the future and has provided his herd with a cow home which is the equal of any in comfort, ventilation, etc.

On the farm at the time the writer was there Mr. Werder had 150 pure-bred Durocs which are housed in hog houses made of concrete. Like the barn, the house, the outbuildings, etc., they are lighted with electricity. Mr. Werder has had splendid success in swine breeding in this upper county, but felt he was entering the winter with a herd too large and at that time contemplated turning some of them into pork. Buttermilk is fed his hogs, he having a plentiful supply always.

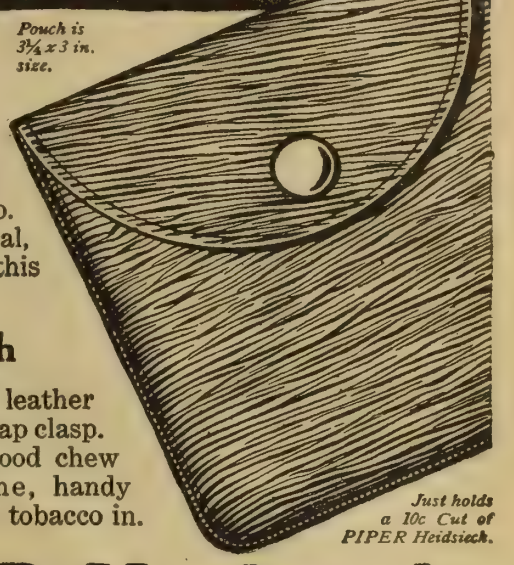
In Troutmere Farm there are 260 acres, 160 of which is under the plow. The other 100 acres is being cleared gradually and when the writer was there Mr. Werder was working with a big stump that was giving him considerable trouble, but which he finally landed with the use of dynamite. It took several charges to blast this stump out, as the central roots were hard to reach, but Mr. Werder said that he had experienced little difficulty with his stumping operations. Occasionally he encounters a tough stump, but by using the pullers, dynamite and his tractor when necessary the stump always yields.

The tractor is used very generally on the farm and is invaluable in stump operations. Mr. Werder also uses it for plowing, etc.

Mr. Werder operates a private creamery in connection with his farm and the product of all his cows is made into butter on the premises. This creamery also takes care of the milk produced on adjoining farms and during the summer Mr. Werder churns twice daily. During the fall he was churning about 500 pounds of butter daily. In connection with the creamery he conducts his own refrigeration system and also his own electric plant which generates the light for the house, barns, etc. He uses a milking machine and finds it very satisfactory and a great labor saver. His milk room off the barn is a model for cleanliness and with running water therein it is easy to keep it clean. His separator he operates with a gas engine and every convenience known to the farmer in the older sections of the state are to be found at Troutmere Farm.

FINE NEW BARN ON THE THEO. WERDER FARM, ASHLAND COUNTY, WISCONSIN.

FREE



Pouch is 3¼ x 3 in. size.

No matter what tobacco you are now chewing, if you will try PIPER Heidsieck you will become a permanent user of this famous tobacco. To induce you to make a trial, we will send you free, this genuine leather

Tobacco Pouch

Strongly made of fine tan leather with a flap and patent snap clasp. Every man who loves a good chew will prize this handsome, handy leather pouch to carry his tobacco in.

Just holds a 10c Cut of PIPER Heidsieck.

PIPER Heidsieck

CHEWING TOBACCO (CHAMPAGNE FLAVOR)

DAIRY

FACTS LEARNED FROM TESTING.

Farmers who have tested their cows say many times that the ones they considered the best were in many cases inferior to others in the herd. A striking illustration of the fact that the test and scales is the only method of knowing the best cows is shown in these figures taken from the herd books of 300 members of the River Falls and Roberts Testing Association. In one herd a cow produced 9,247 pounds of milk, testing 2.7 per cent, making for the year 251 pounds of fat. In another herd an animal gave 8,930 pounds of milk testing 5.1 per cent, with 461 pounds of fat. Here is a case of a cow producing 317 pounds less milk, but yielding 210 pounds more fat. As the average price of fat last year was 31 cents, this leaves a difference of $65.00 in favor of the cow producing the smaller total yield of milk. The cost of feed for the 251-pound cow was $40.00; that of the other $50.00, leaving a net difference of $55.10. In practically all herds fat tests range from 3 to 4 or 5 per cent, the difference of which can only be determined by testing. The length of time required to make a high-yielding herd depends much on the cows from which the heifers are selected. By testing, the farmer has the actual figures relating to the merits of his cows and he is in a position to make a more intelligent selection.

It is interesting to note the differences in cows in the following table:

Average of the twenty-six best cows (one from each herd):

Pounds of milk	6,361
Pounds of fat	332
Cost of feed	$37.90
Profit	$63.65
Average age	6.1 years
Months milking	10½ months
Cost of 1 pound of fat	11c
Returns for $1 expended	$2.72

Average of twenty-six poorest cows (one from each herd):

Pounds of milk	4,868
Pounds of fat	185
Cost of feed	$34.19
Profit	$23.56
Months milking	9.1 months
Average age of cow	4.1 years
Cost of 1 pound of fat	19c
Returns for $1 expended	$1.55

The figures, which cover the year ending February 1, 1915, show that it costs more money to feed a good cow than a poor one, yet by spending $3.71 more for feed, the best cows produced $40.09 more profit. The length of period that an animal is milked has much to do with her profit. The best cows had an average lactation of ten and one-half months, as compared with nine months for the poorest. A dairy cow requires some rest between freshening periods, but a three-month period means feeding too long without receiving any return. It is a common practice with many dairymen to give a six weeks' rest and these figures are in accord with that fact. The results also confirm the somewhat-established fact that an animal is at her best when about six or seven years old.

There has been a great deal of discussion the last few years regarding the time of year for the cow to freshen. It was impossible to secure complete data on this point, due to the fact that in most of the herds the majority of the cows freshened either in the fall or spring. In one herd, however, a basis for studying this problem was possible, since ten cows freshened during the fall and ten in the spring months.

	Av. of fall cows (10)	Spring cows (10)
Lbs. fat	388	322
Cost of feed	$43.00	$41.50
Profit	$76.45	$57.60

After freshening, a cow gives a good flow of milk. If this occurs in the fall and good feeding follows, she will maintain her milk secretion until spring. When turned to pasture the milk yield may increase, making it possible to maintain a long lactation period, with good results. Fall and winter prices for butter fat are always higher than at other times of the year. Farmers have more time to care for the calves at this time than during the rush work of spring. As evidence that farmers are appreciating this point is seen in the increasing number of dairymen practicing fall freshening.

Below are some rations that produced good returns:

(1) Silage, 30 pounds.
Fodder,
Alfalfa, 7.5 pounds.
Mixture oats, bran, oil meal, 10 pounds.

(2) Silage, 25 pounds.
Clover, 7 pounds.
Mixture oats, bran, oil meal, 8½ pounds.

(3) Silage, 40 pounds.
Fodder, 3½ pounds.
Mixed hay, 6.6 pounds.
Oats, bran, corn, 7 pounds.

One of the greatest problems in dairying is the feeding. A successful dairyman must produce a large amount of milk at the least possible cost. The question of knowing when the cow is fed to her inherited capacity is many times a perplexing one. Some are overfed, others underfed. It is only by studying and noting the results that one is able to come to a satisfactory conclusion. A practical rule that has been found successful is to feed one pound of grain daily to every three or four pounds of milk produced, giving all the roughage she will consume without waste. It is very necessary that the ration be succulent and palatable, since investigators have proven that palatability improves digestion and increases the amount of food a cow may consume. Variety in the ration is of the utmost importance to dairy cows and if this factor is not considered the results will likely be poorer than the animal's possibilities.

SANITATION IN DAIRY PRODUCTS.

"Sanitation First" is the slogan of George J. Weigle, of the dairy and food commission of the state of Wisconsin. Wisconsin is the leading state in the quantity of dairy products produced, and it is the commissioner's aim to co-operate with other interests in making it first in quality as well.

The dairy and food commission, under authority of chapter 597 of the laws of 1915, have adopted a set of comprehensive rules and regulations for the manufacture of dairy products. These regulations go into effect January 1, 1916. Many of these rules appear very simple and unnecessary to anyone who is interested in the present conditions of Wisconsin factories. But it is just such simple laws which either through negligence of the operator or lack of proper facilities are most often disregarded, according to men of experience in the business. For instance, the new rule that factory floors, fixtures, utensils and other apparatus shall be cleaned at the close of each operation, seems at first sight to be an unnecessary regulation. One would expect the operator to do these things from common sense or decency, but it has been the experience of the dairy and food commission to find that just such rules are the most often disregarded.

The cheese and buttermakers are heartily in favor of the policy of the dairy and food commissioner, and at the recent meetings at Eau Claire, Fond du Lac, and Green Bay they showed their willingness to co-operate with him. Perhaps the chief reason for this new interest is the fact that heretofore the blame rested entirely on the operator. Now, however, the blame will be settled upon the owners, and they must provide the operator with the proper facilities to maintain the factory and product in a sanitary condition.

The owners of the factory at Mt. Horeb have already caught the spirit of cleanliness and have requested one of the members of the commission to inspect their plant in order to ascertain whether they should build a new factory or remodel the old one. The commission found that a new factory would be advisable. Now the owners have recently sent a man to Madison to confer with the commissioner on plans for a new building. This spirit is not only manifested at this particular place, but also is spreading by leaps and bounds throughout the entire state.

Sections 1410b-1 and 1400-2 of chapter 597 require not only the licensing of butter and cheesemakers but also of operators of butter and cheese factories. This is another very great step towards the goal of the commissioner. Since these licenses are subject to revocation by the dairy and food commissioner upon reasonable written notice that the licensee has violated any of the rules and regulations of the state relating to milk or cream or milk or cream products, the operators are forced to set a high standard to protect themselves.

Some of the requirements that a man must fulfill in order to obtain a butter or cheesemakers' license are that he shall have had twenty-four months' experience for a buttermaker, and twelve months for a cheesemaker, also, he must have a creditable record in operating and keeping in sanitary

Only $2 DOWN and One Year To Pay

For any Size—Direct from Factory

You can now get one of these splendid money-making, labor-saving machines on a plan whereby it will earn its own cost and more before you pay. You won't feel the cost at all.

Get The Latest Modern Silage Methods Only 10c

Tells you all there is to know about present-day silage feeding—how to build silos. Gives reliable and unbiased facts (we do not sell silos) on every silo built—home made—stave, hoop and octagonal silos—pit, brick, tile, cement, concrete silos—all modifications. Also covers every crop used for silage—41 of them. Here's an entirely new book—264 pages—better than former copies used as text books in colleges. Copyrighted November, 1914. Ten page index. We send it for 10c coin or stamps. Send for this new copy today.

Silver's "Ohio" Silo Fillers

Write for catalog and booklet "Silo Filler Logic" which we send free. Enclose 10c and we send "Modern Silage Methods" with them.

The Silver Mfg. Co.
312 Broadway, Salem, O.

THE HINGE DOOR SILO

THE most convenient and best equipped silo made. Doors always in place. Strong steel frame. Perfect anchorage. Best material throughout. We also make the Lansing Silo, the Chicken Silo, and Tanks of all kinds.

Main Office: Dept. 19 Lincoln, Neb.
Factories: Lincoln, Neb.; Lansing, Mich.; and East St. Louis, Ill.

$15.95 Upward ON TRIAL

American FULLY GUARANTEED CREAM SEPARATOR

A SOLID PROPOSITION to send new, well made, easy running, perfect skimming separator for $15.95. Skims warm or cold milk; making heavy or light cream. Bowl is a sanitary marvel; easily cleaned.

ABSOLUTELY ON APPROVAL

Different from picture, which illustrates our large capacity machines. Western orders filled from western points. Whether dairy is large or small write for handsome free catalog. Address:

AMERICAN SEPARATOR CO., Box 4126 Bainbridge, N. Y.

condition any factory or factories in which he may have been employed. These requirements bar beginners from filling the buttermakers' place at once, and thus increase the standard and efficiency of the butter and cheesemaker.

Although these new rules and regulations which are to take effect in January, are inadequate to meet the entire situation in the factories of today, it is a step in the right direction. With a good start the rest will follow easily. The rules of the commissioner are considered reasonable and easy to obey, and if he receives the proper co-operation he expects that his ambition will be realized, and the cleanliness of Wisconsin's greatest industry will then be an assured fact.

COW-TESTING PROGRAM.

Wisconsin dairymen who are interested in the subject of cow testing will be able to get a great many pointers if they attend the conference on this subject to be held in Madison February 7th-12th. The first open session of the conference will be held at 9 o'clock Tuesday, February 8th, and the program of topics and addresses will be as follows:

TUESDAY, FEBRUARY 8TH.
A. M.

9:00 Market Prices for Dairy Products During Twenty-five Years of Dairy Development—E. H. Farrington.
10:00 Undeveloped Opportunities for Dairy Farming in Wisconsin—E. J. Delwiche.
11:00 The Soil and Its Relation to Dairy Farming—A. R. Whitson.

P. M.

1:30 The Place of Grain and Forage Plants in Dairying—R. A. Moore.
2:30 Dairy Cattle Judging and Lecture—A. C. Oostrhuis.
3:30 General Aim of Our Cow-Testing Association Work—N. A. Negley.
4:00 Co-operative Enterprises of Cow-Testing Associations; Association Feed Ring—Ralph Splettstoeszer, Welcome Association.
Co-operative Buying of Feed—Louis Bober, Hillsboro, Association.
8:00 Our Friends, the Dumb Animals (Illustrated Lecture)—Dr. A. S. Alexander.

WEDNESDAY, FEBRUARY 9TH.
A. M.

8:00 New Methods of Controlling Diseases in Animals—F. B. Hadley. Value of Veterinary Service in Association Work—Alfred Parrot, Menomonie.
9:00 Economics of the Dairy Industry—L. C. Taylor.
10:00 Milk and Animal Nutrition—E. B. Hart.
11:00 Care and Management of the Dairy Calf—G. C. Humphrey.

P. M.

1:30 Testing Milk, Cream and Skim Milk, Laboratory Work—E. H. Farrington.
3:00 Record Keeping—C. L. Burlingham, United States Department of Agriculture.
4:00 Analysis and Application of Records—J. A. James.
5:00 Association Management—H. C. Searles.
Printing Reports—Frank Lynn, Eastern Pierce county.
6:30 Babcock Jubilee Banquet.

THURSDAY, FEBRUARY 10TH.
A. M.

8:00 Computation of Rations—G. C. Humphrey.
Discussion led by A. L. Odeen, Northport and Royalton Assn; Geo. L. Moss, Waupaca and Butternut Assns., and Richard Adams, Stanley Assn.
10:00 Cow-Testing Association Work in Dunn County—Theo. Sexauer.
11:00 Common Diseases of Cattle—F. B. Hadley.

P. M.

1:30 Judging Dairy Cattle—A. C. Oosterhuis.
3:30 Production and Care of Milk and Cream—A. C. Baer.
4.30 Care of Cream Separator, Dairy Utensils and Milking Machine—G. H. Benkendorf.
7:30 Address—Math. Michels, President Wisconsin Dairymen's Assn.
Guernsey Island (Illustrated Lecture)—Chas. L. Hill.
Moving Pictures, "From Cow to Consumer."

FRIDAY, FEBRUARY 11TH.
A. M.

8:00 Feeding Dairy Cows—C. C. Humphrey.
9:00 Dailry Cattle Management—A. C. Oosterhuis.
10:00 Value of Pure-Bred Sire—R. E. Baker.
Bull Associations—O. E. Winkjer, United States Department of Agriculture.

P. M.

1:30 Moving Pictures—Alfalfa.
2:30 Stable and Silo Construction—F. M. White.
3:30 Official Dairy Testing—R. T. Harris.
5:00 Proper Testing and Care of Outfit—J. H. Toolajian, Fox River Valley Assn.
7:40 Live Stock Lecture and Lantern Slides—Animal Husbandry Department.
Moving Pictures—"Homemade Silo," "Cow-Testing Associations."

SATURDAY, FEBRUARY 12TH.
A. M.

8:00 Marketing Dairy Products.
9:00 Question Box, Answers and Discussions.
10:00 Reports from Secretaries of Associations, Suggestions, Criticisms, etc.
11:00 Address—C. P. Norgord, Commissioner of Agriculture.

It is expected that Judge W. B. Quarton, Algona, Iowa, and other prominent breeders will attend and address the convention.

NEW RICHMOND TESTING.

Ivor Jones, official tester for the New Richmond Cow-Testing Association which has been in operation during the past ten months, reports that the farmers are much pleased with the business way of dairying and that they can get more profitable results on dry feeding than on pasture. Mr. Jones, in connection with the list of forty pounders for the last month which has just been made public, says that a second silo is going to be more profitable than so much pasture and that intelligent feeding, careful selection of stock and weeding out of unprofitable cows is going to do wonders for the dairy farmers of that vicinity.

The report shows twenty-eight cows in the forty-pound list and three two year olds in the thirty-five-pound list. His report for the last thirty-day period follows:

Owner, name and breed	Age	When fresh	Pounds milk	Per cent fat	Pounds B. fat

The milk in the pail the cow kicks over is lost forever

AND the butter-fat that goes into the can through the skim-milk spout of a cheap, inferior or worn-out cream separator is just as surely lost as the milk in the pail the cow kicked over.

If you are trying to get along without a cream separator; or with an inferior or worn-out machine, you are losing butter-fat right along and butter-fat is money.

Get Your DE LAVAL Now — Right Away

every day you use it it will be paying for itself out of its own saving.

If you haven't the spare cash right now that need not hinder your immediate purchase.

We have an arrangement with De Laval agents which makes it possible for any reputable farmer to secure a De Laval on the partial payment plan—a small payment at time of purchase and the balance in several installments, so that a De Laval really pays for itself while you are using it and getting the benefit from it.

Let the De Laval start saving cream for you right now while butter and cream prices are highest. See the nearest De Laval agent at once, or if you do not know him, write us direct for any desired information.

THE DE LAVAL SEPARATOR CO.

165 Broadway, New York 29 E. Madison St., Chicago

50,000 BRANCHES AND LOCAL AGENCIES THE WORLD OVER

OPEN UP FARMERS' PLANT

The Farmers' Co-operative Packing Plant at Wausau was recently thrown open for business. There were two carloads of hogs and considerable other stock offered on the first day. There are about fifty men employed at the plant and stock will be received as needed from anyone regardless of whether he is a stockholder in the co-operative enterprise or not. The Wausau plant is one of the best in the state and offers a good opportunity to test the co-operative packing plan.

PROFITS OF PACKING PLANT.

A year ago it was reported that the Farmers' Co-operative Packing Company, of La Crosse, was near bankruptcy. A report just issued shows the company made $1,800 in December. This is the first farmers' co-operative packing plant organized in the United States.

FOR BABY BEEF CONTEST.

Arrangements are being made for a baby beef contest in connection with the Janesville, Rock county, fair. Mr. R. Baker, of Madison, as secretary of the Wisconsin Live Stock Breeders' Association, appeared recently before the board and outlined the plans for the baby beef contest.

Ask your neighbor to subscribe for The Wisconsin Farmer.

AIDS TO GOOD HEALTH.

"An apple a day keeps the doctor away." And the doctors tell us that plenty of water will accomplish the same end, and water is cheaper and easier to get than apples. Because of its very cheapness we underestimate the value of water to keep our bodies in proper shape. Most of us look carefully to the cleansing of our outer bodies and then neglect to see that our inner bodies are given the same treatment. Physicians say that every individual should drink six to eight glasses of water each day, one upon rising, two or three between breakfast and dinner, two or three between dinner and supper and one upon retiring. That sounds easy enough and yet it is a fact that very few of us drink as much as this. The rule is always to drink before and after meals and not with them. Drink often of good, pure water, not a sup but a glassful.

And even cheaper and easier to get is fresh air. Day and night it should circulate through your homes, through the living rooms and the sleeping rooms, bringing with it health and vigor. Moreover, contrary to a very generally accepted notion that night air is not good for one, it is the very purest air we breathe. Actual tests have proved again and again that the bacteria count in the night air is much lower than that in the air during daylight when the activities of the world are at full height and the maximum of dirt and dust is active. Yet, in spite of this demonstrated scientific fact, thousands and thousands of people shut up their sleeping rooms during the winter for fear of letting in the "cold, damp night air." In the summer, of course, windows are opened to let in the cooling breezes, but during the winter months the purifying fresh air is diligently shut out, and thousands sleep in closed-window rooms and breathe over and over the vitiated air, rendered disease-breeding by the waste of their own bodies.

A VALUABLE KITCHEN ARTICLE.

No kitchen utensil will be found more useful than a good pair of steel scissors. They will save many cut fingers and much time. A medium-sized pair with good cutting point will answer every purpose.

There are many processes in the preparation of food that are often difficult to perform with a knife and yet they can be done easily and quickly with a pair of good, sharp scissors. Take, for instance, the disjointing of a fowl, there is nothing like a pair of sharp scissors for severing the joints. It is done quickly, neatly and easily and without splintering any bones in the process.

They are ideal for cutting celery, parsley, cabbage, carrots, etc., for soups and salads.

In the spring they will cut the young, tender stalks of rhubarb into cubes without removing the skins. It gives a pretty color to the sauce and the flavor is much finer when the skins are left on.

It is much easier to cut marshmallows with scissors than with a knife. The same is true of citron, lemon and orange peel.

They are most useful in the preparation of grape fruit, as the tough parts can be clipped out so easily. Large bunches of grapes and raisins can be readily divided into the right portions with scissors and are not torn or bruised as when a knife is used.

They are handy to cut shelf paper, covers for jelly glasses and butter jars, to cut up molasses candy, or to cut fruit off vines.

These are only a few of the services which the scissors will perform daily for the housewife. But they must receive the very best of care if they are to do their work well. They must be carefully cleaned and washed—and scoured occasionally, and thoroughly dried after each time they are used. When hung up let them be open. They should never be allowed to get rusty.

ESSENTIALS OF GOOD TASTE IN CLOTHES.

Individuality, simplicity and quality of material are elements that must be considered by the girl or woman who aspires to be well dressed in the judgment of Miss Florence Hunt, assistant in domestic art in the Kansas State Agricultural College.

According to Miss Hunt, too much stress cannot be placed on the importance of developing good taste. Good taste includes knowledge of color, line, form, material and suitability to the occasions upon which the dress is worn. Dresses for school, business, home or street wear or for dress affairs should, of course, be distinctive.

Then the costume must be suited to the individual according to line and form. A tall person cannot wear the same style as the short person. The same principles apply also to materials used.

The study of color harmony is essential also in the designing of appropriate costumes. There are materials which will not combine well and colors that should not be used together.

Another problem is the study of the design principles—the relation of rhythm, balance and harmony to dress. In Miss Hunt's department the greatest effort is made to impress upon girls studying costume designing the value of simplicity, good quality and less decoration. Women in general are beginning to give more thought to this phase of the costume question, and it is a step in the right direction. Simplicity and good quality, to a great extent, solve the dress question both as to economy and attractiveness of the finished product.

BREAD-MAKING POINTERS.

Bread is one of the simplest of our cooked foods, but making it involves some very complicated processes which will give better results if they are thoroughly understood by the housekeeper, according to Miss Addie D. Root, of the Missouri College of Agriculture. The first essentials are perfectly clean vessels and good strong yeast. No particular kind of yeast is better than any other, but whatever kind is used should be tested to see that it is not too old to give good results. It contains little plants which grow and give off gas, thus causing the bread to rise. In old yeast most of these plants are dead, so it is best to see whether it is live enough to form bubbles or foam in a few minutes after yeast has been added to sugar and lukewarm water.

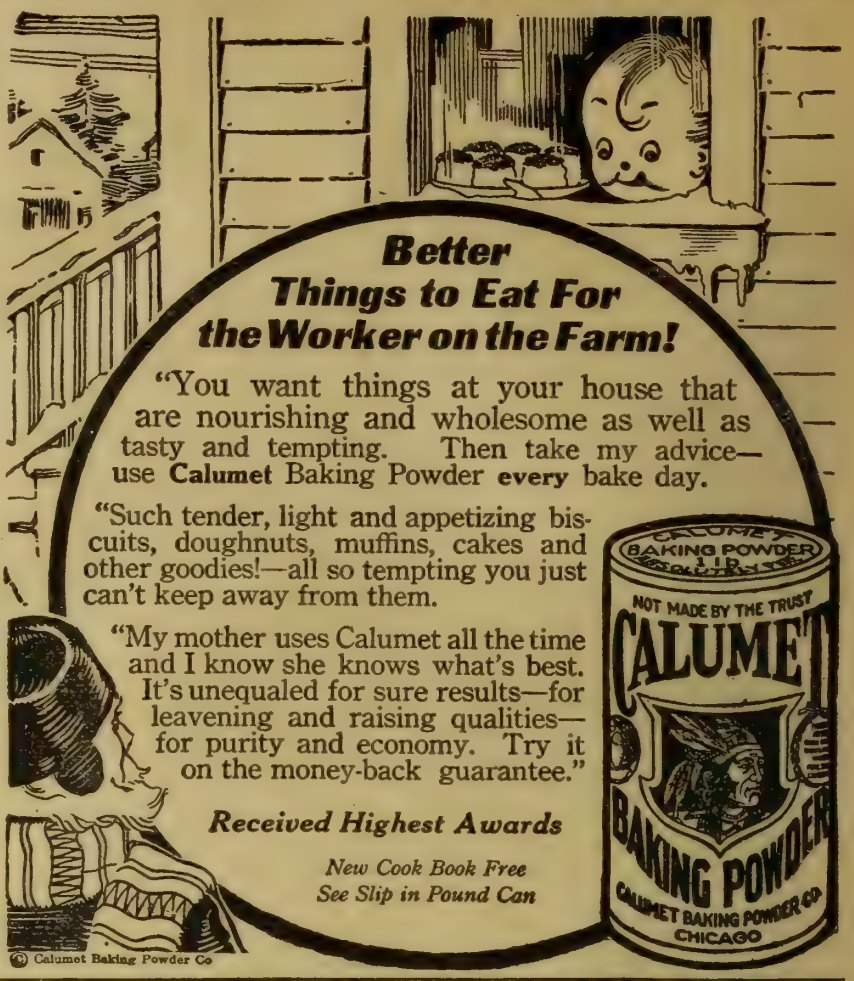
In mixing the dough if the flour is added gradually and thoroughly beaten into the liquid it will carry in enough air to make the yeast plants grow, for air is almost as necessary to them as it is to animals. If the dough is made too stiff, harsh, dry, crumbly bread will result, so as little flour as possible should be used, but enough must be used so that the dough will not be sticky.

In kneading use a quick, even stroke and be sure that the yeast plants reach every part of the bread in order that it may have a good, even texture. Never knead bread over thirty minutes, as too long kneading will destroy the elasticity of the dough. After fifteen or twenty minutes the surface will usually be smooth and velvety and gas bubbles will begin to appear, indicating that kneading has been continued long enough.

Set the bread to rise in a clean bowl covered tightly. If the temperature

A CITY WOMAN MAKING GOOD ON THE FARM.

She says she cooks for four men, yet finds time to raise poultry despite the fact that she never was on a farm until last summer. As you see, she is happy.



is kept between 80 and 95 degrees F. it will not be necessary to oil or moisten the surface to keep a crust from forming. It the dough is kept too warm while rising it will become soft and runny, too much gas will be formed, bacteria will grow, and the bread is likely to be dark, coarse and sour. Chilling will not stop the growth of yeast and formation of gas, but is likely to cause an undesirable crust to form over the dough. When the dough has risen in a warm, even temperature to about twice its first bulk and been properly worked, there should be little danger of souring.

The oven should be just hot enough to stop the dough from rising in the pans, after it is put in to bake, but should not be too hot at first. If a thermometer is used, start the bread in an oven at 360 degrees F. and increase the heat gradually for fifteen minutes, but lower it again after about thirty minutes. The bread should begin to turn brown in patches during the first fifteen minutes and should have an even brown surface at the end of half an hour.

If the dough has not risen to twice its original bulk it may be started in a cooler oven and allowed to continue to raise during the first ten minutes of baking.

BUCKWHEAT CAKES.

To the Editor:—I am sending you a good recipe for buckwheat cakes or griddle cakes that I have used for years.

Soak a yeast cake in lukewarm water, then stir in flour as you would start for bread in the morning. Then at night put one-half buckwheat flour and one-half wheat flour. I use milk, or if I do not have milk I use cold water. Make a thick batter. In the morning stir in half a teaspoonful of soda in a little water to sweeten the batter. Use milk to thin the batter.

Bake on a hot griddle; do not start baking until the griddle is hot enough to smoke. Turn the cakes as soon as there are holes in the top.

I save about a cupful of the batter for the next time, so that I do not need any more yeast. Set at night for each morning and each time save out a cupful or more of the batter to start the next lot.

These cakes are fine, never heavy or hard. I put them in a covered turene until ready to eat. Mrs. Sam Hall.

SHORT PRAYERS FOR LITTLE FOLKS.

To the Editor:—Not long ago someone asked for children's prayers and I will enclose some for you to use if you wish.

BLESSING.

We thank Thee, Lord, for daily bread,
And all the blessings on us shed;
We pray Thee fill us with thy love,
And guide us to our home above.
—Ps. 38-8.

EVENING PRAYERS.

Jesus, take this heart of mine,
Make it pure and wholly Thine;
Thou hast bled and died for me;
I will henceforth live for Thee.
—Matt. 19-14.

Fill Thou my heart with grace,
That I may clearer see;
The endless store of love
With which Thou blessest me.
—John 3-11.

Keep my heart, dear Lord, from sin,
Grant no evil dwell therein;
But as lilies fair and white,
Pure thoughts blossom in Thy sight.
—Matt. 5-8.

I want to live not only for myself,
To do some kindly deed, something for Thee;
To give some proof of gratitude, dear Lord,
For all the wondrous love Thou gavest me.
—Rom. 15-3.

Now I lay me down to sleep,
I pray Thee, Lord, my soul to keep;
Thy love be round me through the night,
And wake me with the morning light.
—Ps. 127-2.

MORNING PRAYER.

Now I wake and see the light,
'Tis God has kept me through the night;
And so I lift my voice and pray,
That he will keep me through the day.
—Josh. 1-5.

These are taken from a printed list of prayers which I have and I hope they will benefit someone.

Mrs. L. A. Inglett.

RECIPES.

Devil's Food Cake.—One-half cup butter, one and one-half cups sugar, yolks of four eggs, two squares chocolate dissolved in four tablespoonfuls boiling water, one-half cup cream or milk, one and three-fourths cup flour, whites of four eggs, two teaspoonfuls baking powder, one teaspoonful vanilla. Cream, butter and sugar, beat the eggs light, sift flour and baking powder together, then put all together in the order given. Put together with boiled icing.

Ham Croquettes.—One cup finely chopped cooked ham, one cup bread crumbs, two cups hot mashed potato, one large tablespoonful butter, two eggs, speck of cayenne pepper. Beat the ham, cayenne, butter and eggs into the potato. Let it cool slightly and shape like croquettes. Roll in bread crumbs, dip in beaten egg and again in crumbs, put in frying basket and plunge into boiling fat. Cook two minutes. Drain and serve.

Stuffed Baked Apples.—Wash and core the number of apples desired. Place in baking dish. Fill the centers with orange marmalade, jelly or a mixture of chopped nuts and raisins. Cover the bottom of the dish with hot water. Cook in oven until the apples are tender. Serve hot or cold with cream.

Orange and Date Salad.—Peel six oranges and a grape fruit, remove inner skin from the pulp and break into small bits. Wash, stone and cut into strips a pound of dates and mix with the fruit. Add one-half cup chopped nut meats and a dressing made of the yolks of two eggs, beaten light, one-half cup sugar, one cup orange juice and one tablespoonful of lemon juice. Ordinary boiled salad dressing may be used if prefrred.

Raisin Loaf Cake.—Cream, one-half cup of butter with one and a half cups of sugar. Add one cup of seeded raisins (cut in halves) and mix thoroughly. Then add two beaten eggs. Mix and sift two cups of flour with three teaspoonfuls of baking powder and add to the first mixture alternately with one cup of sweet milk. Flavor with one teaspoonful of lemon extract and bake in a loaf about one hour.

Dainty Dessert.—One quart milk, five rounding tablespoonfuls cocoa, four tablespoonfuls sugar, four tablespoonfuls cornstarch, one small teaspoonful salt, one cup macaroon crumbs, two egg whites. Heat milk, mix dry ingredients together, moisten with a little water and turn slowly into hot milk, stirring constantly. Cook until thick and smooth. Stir in macaroon crumbs and then fold in lightly the egg whites, which have been beaten stiff. Serve cold with whipped cream.

LYLE ELLSWORTH DAVIS, AGE FOUR MONTHS, WEIGHT FIFTEEN POUNDS.

FOR THE HOUSEWIFE.

A pinch of salt improves any cake.

Mix your pancake batter with an egg beater and you will have no lumps in the batter.

A trap baited with sunflower seeds is one of the most efficacious means of catching rats.

When baking fish never forget to line the pan with waxed paper; then there will be no disagreeably sticky dish to wash afterward.

When ironing waists for the boy or aprons for the girl put a clean handkerchief into the pocket of each before you hang it up, and they will never start to school without this essential article.

One teaspoonful of sweet cream in icing prevents crumbling when cut.

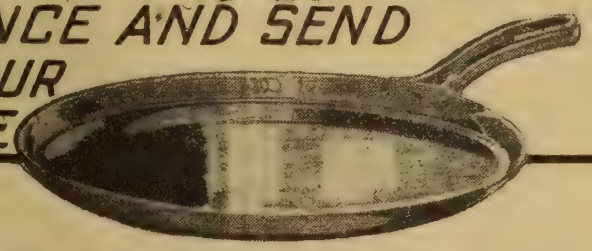
Wipe the range with brown paper after cooking and it can be kept bright with little trouble.

A snap clothespin has untold possibilities if kept near the kitchen stove. It may be used to lift hot kettle lids, pull saucepans from the fire, and will assist, without burning fingers, in turning pies or cakes in the oven.

An old tooth-brush will be found serviceable for spreading blacking on shoes. The long handle prevents the hands from getting soiled and it is durable and convenient. The shoes should be polished with a soft brush afterwards.

Karo Premium Griddle

$2.25 SOLID ALUMINUM GRIDDLE FOR 85 CENTS IN CASH AND LABELS FROM 50 CENTS WORTH OF KARO—GET YOUR KARO LABELS AT ONCE AND SEND FOR YOUR GRIDDLE



EVERYBODY these days knows aluminum ware—the highest priced and the most satisfactory kitchen ware used in this country.

Here is your chance to get a 10½ inch Solid Aluminum Griddle for less than the wholesale price.

This Aluminum Griddle needs *no greasing*. It heats uniformly all over; it doesn't smoke up the house; it doesn't chip; it doesn't rust and it looks so much better and cleaner than any of the old kind of griddles.

It bakes Griddle Cakes that are really just as crisp as you want them to be. With Karo on them, they are the finest eating in the world—and so *digestible* because baked without grease that many people who haven't dared to eat griddle cakes for years, are enjoying Karo and Griddle Cakes now.

At great expense we are seeking to place a Karo Aluminum Griddle in the homes of all Karo users, so that Karo—the famous spread for griddle cakes and waffles—may be served on the most deliciously baked cakes that can be made.

Go to your grocer today and get 50 cents worth of Karo and send us the labels and 85 cents in stamps or money order at once. You'll get your Aluminum Griddle by prepaid parcel post.

You know Karo, no doubt. It is the best known and most universally liked syrup in this country. Last year 65,000,000 cans were sold.

Get your Karo today—and send us the labels and 85 cents at once, so as to be sure of getting yours. We will also send you *free* the famous Corn Producs Cook Book.

THE YOUNG FOLKS

All letters from boys and girls to this department should be sent to office of The Wisconsin Farmer, Madison, Wisconsin.

FAIRER THAN A FAIRY.

Many, many years ago a beautiful princess was born to a king and queen far across the sea. The king, who was at war with several other rulers, had to be away from home all of the time and sent for his wife to join him. So they left their little daughter in a castle, which had been built by a mighty magician, and in the care of a wise old nurse, who loved the little princess as well as she loved her own children.

Everyone loved the princess and if you had seen her you would not have wondered at it. She was the most beautiful person that ever lived, the people said. Even as a tiny baby no name seemed to fit her but Fairer-Than-a-Fairy. So let us call her Fairer in the rest of our story.

For several years Fairer lived happily with her nurse in the castle, studying and improving her mind. Her beauty became so famous, in spite of her not going anywhere, that all the fairies were jealous and decided to destroy little Fairer.

Their queen was indeed lovely to look upon and she was so tiny that she was called Dwarfina. But she was mean and spiteful of disposition and plotting some way to hurt Fairer. At length Dwarfina came to the castle dressed like a serving maid and her ways were so charming, as only those of a fairy could be, that she soon became Fairer's favorite.

As long as she remained in the castle which the magician had built Dwrafina had no power. One day, however, Dwarfina, who was clever at dancing, in amusing Fairer and the other maidens, danced far out of the castle yard. Suddenly the deceitful little fairy queen pretended to faint and Fairer was so distressed that she rushed to her assistance. With a wave of her wand as Fairer stepped off the castle yard, where the fairy queen had no power, Dwarfina carried the beautiful maiden away to fairy regions deep in the earth.

Here Fairer learned that she had been captured by the maid whom she had loved best and she thought her heart would break. The fairies locked her in dungeons far away by herself and gave her many hard tasks to do.

She wept and wept until she fell asleep with her first task undone. Presently she was awakened by a bright light shining through her prison. There in the light stood a tall and princely young man.

"Who are you, young stranger?" asked Fairer. "Are you a god?" for she had never seen such a young man before.

"I'm not a god," answered the young man, "but I love you more than anything and I have come to help you. My name is Pyrrho and my mother is the fairy who has shut you in prison here."

Every night after that Pyrrho came and performed the tasks which the wicked fairies laid out for Fairer. Once it was to change a great basket of acorns into pearls; another time it was to clear thousands of cobwebs out of the long galleries of the dungeons. And after each task the fairies were much surprised and would give Fairer something harder to do.

They sent her to Sugar-Loaf Moun-

tain to get a goblet of the water that gave eternal life. When she got there she could not climb. So Pyrrho appeared in the form of an eagle, and, taking one of her slippers, brought it back from the top of the mountain full of the water of eternal life.

By this time Fairer truly lov the fairy prince as much as she had admired him from the first. His mother, Dwarfina, did not know that he was in love with her prisoner, but she was beginning to tire of having the work she set out for Fairer all so perfectly done. It gave her no excuse for doing away with the lovely princess.

As a final task and one that she was sure would end Fairer's life, Dwarfina sent her into the Forest of Marvels to capture the deer with silver hoofs. The princess started out with a little basket of food on her arm and soon was lost to sight in the forest, which seemed to close in all around her. In a short time she saw the deer with silver hoofs drinking from a stream near her, and, setting down her basket she started after the pretty animal. They ran on and on and then the deer disappeared and left Fairer all alone.

In despair fairer lay down and cried herself to sleep. A chorus of nightingales awakened her in the morning Some way she seemed to have more strength than she had before and so she spent the whole day chasing after the deer again.

At the end of three days Pyrrho appeared to Fairer in a dream and said to her:

"My dear Fairer, the cruel Dwarfina, my mother, knows that I have been helping you and so she has placed me in a dungeon for all but one hour in the day. Take this wand and wherever the silver-hoofed deer goes, follow. You will come to a bramble thicket at the entrance of which is a fire. Go past the fire and burn the skins of the animals which you shall find hanging there."

Then Pyrrho disappeared, leaving behind a wand with Fairer.

Now Fairer chased the deer with new hope in her heart. At the end of the fifth day it led her into a bramble

THE VERY BEST OF FRIENDS.

thicket at the entrance of which a fire was burning. Fairer ran on by until she came to a cozy little place in which was hanging the skin of a silver-hoofed deer. This she took on her wand, and, carrying it to the fire, burned it.

Looking around then she saw that she was in a little outdoor room which had many dainty little beds in it and was carpeted with Persian rugs. While she was wondering at this she heard the happy laughter of maidens. A lovely woman and several maidens entered the room.

"Dear maiden," said the lovely woman, "you are my deliverer. I am really queen of the fairies. I was changed into a deer, to live in that state for 300 years unless some maiden like you could capture me in the forest which is owned by the wicked Dwarfina. She has ruled in my place ever since I was enchanted. All these girls have tried and at the end of ten days' hunting they have been changed into animals. If you had failed you would have been a white rabbit."

Then they all left the Forest of Marvels and traveled back to Dwarfina and her bad fairies, who believed that Fairer had perished.

"Your power is at an end," said the real queen to Dwarfina. "You have done so many wicked and spiteful things, wholly unworthy of a fairy, that you may return to the islands where you were born. Only leave with me your son Pyrrho."

As Dwarfina was leaving Pyrrho came into the hall to bid her good-by. After she was gone he turned to Fairer, and the queen, seeing that they were in love with each other, sent them back to the kingdom of Fairer's father. Here they lived for many years in true happiness and the good fairy queen often visited them.

International Sunday School Lesson

Lesson for January 30, 1916
(By E. O. SELLERS, Acting Director of Sunday School Course.)

THE LAME MAN LEAPING.

LESSON TEXT—Act 3.
GOLDEN TEXT—Peter said, "Silver and gold have I none; but what I have that give I thee. In the name of Jesus Christ of Nazareth, walk."—Acts 3:6 R. V.

The coming of power (Chapter 2) is soon tested outside of the circle of believers. It is put to a public test, is tried as to its efficacy physically—i. e., has the Holy Spirit power physically as well as over the spirits of men?

I. **The Appeal to Peter and John, vv. 1-10.** Following Pentecost the disciples seem to have continued their accustomed mode of life. (1) The apostles and worship (v. 1). As yet,

A PREMO CAMERA
Is a Necessity--Not a Luxury

This camera is made by the Eastman Kodak Co., is of the box type, with universal focus lens, the simplest instrument for picture-making that can be devised. It will produce excellent results in the hands of anyone; no experience necessary. Film pack used, daylight loading. Pictures 1 1-4 x 3 1-4. Booklet of instructions included with each camera.

HAVE YOU ALWAYS REGARDED A CAMERA AS MERELY A "PLAY-THING?"

What do you raise?

Fruits? Livestock? Grain? Flowers?

It doesn't matter--whatever it is, you raise it to sell, don't you? Now, how much better than "telling" distant prospective customers what you have, is ***showing*** them! You can't bring them to your farm, but pictures will get practically the same result. One picture tells more than pages of words.

What better way of keeping a record of growth, than by pictures?

A Picture of old Dobbin with Baby on his back, will be priceless twenty years from now.

HERE'S HOW YOU CAN GET A CAMERA--

Given with The Housewife for one year at $1.80. Cameras sent postpaid, delivery guaranteed.

Remit by P. O. Money Order or Registered Letter. Address

The HOUSEWIFE, 30 Irving Place, New York City

and indeed for many years to come, there was no particular separation of Jews and Christians.

Praying men like these two leaders, Peter and John, continued to fulfill their temple duties. The ninth hour was the prayer hour, the hour of sacrifice (Ex. 29:39, I Kings 18:36).

All true approach to God must be on the grounds of sacrifice (John 14:6, Heb. 9:22) and we must remember that this hour was the one at which Jesus died for us, our sacrifice (Heb. 10:19, 29).

Emphasize the need and importance of worship and prayer.

(2) The afflicted one (v. 2). This man had been there often and made his usual appeal; his expectation was limited to material aid (v. 5); he may or he may not have been familiar with Christ and His teachings, but something unusual was about to happen because the two to whom he appealed really knew God and on them now rested this new power in the world.

(3) The apostle's response (vv. 4-7.) Peter took a good look at the man (v. 4). Peter was changed by a look (Matt. 16:7). What he saw was the man's fundamental spiritual need. (a) Demanding the man's undivided attention, Peter gave the man what he had not—not what the man wanted or expected.

Peter's words, "Look on us," and Paul's "Be ye followers of me" (I Cor. 4:16) are in no wise egotistical, but in each case the fearless appeal of a man wholly God's, men conscious of the endowment of power, trying to seize the wavering wills of men that they might point them to Christ. (b) Peter aroused the man's expectancy.

It is usually men lacking in silver and gold who give to the world its greatest blessings and highest good (I Cor. 4:11).

Every effective Christian worker must base his appeal upon the facts of a personal experience (I Pet. 4:10 11). (d) Peter bade the man to do the very thing he (humanly) could not do, but the thing which, "in the name of Jesus Christ" he would be able to do.

(4) The result. (1) Upon the man. There is no doubt as to the completeness of the cure (v. 8). He had "strength;" was "lifted up" from his former position of weakness; he "leaped" (literally, ecstatic joy); he "walked," continuous activity; and he "worshiped," thanksgiving and renewing of strength. (2) Upon the people. (a) "All the people saw." They may not have heard or comprehended the words of Peter, but they did witness the transformation. (b) "They took knowledge" (v. 10), they began to observe, even as the world always does, the one who professes his faith in Christ. (c) They were filled with "wonder and amazement" (v. 10), they could not understand. No more can the world today (See I Cor. 1:18, 23) really comprehend the Christian. There was no guesswork, however, about this miracle, and, of the people who witnessed it and were so filled with wonder and amazement, many were converted (Ch. 4:4).

The miracle served to get for the gospel a good hearing and it accomplished its purpose (Rom 1:16).

II Peter's Appeal to the People, vv. 11-26. Notice it was the man who attracted the crowd, not Peter or John, for he eagerly held the disciples while the crowd gathered (John 5:10, 11). This may suggest the weakness of the man's faith in that he depended upon Peter and John rather than upon Jesus. (1) Peter seized this opportunity (v. 12) and began his salutation by taking advantage of their curiosity.

Peter eagerly turned their thoughts from himself unto Jesus. He wished to divert attention from himself and used the miracle for the double purpose of glorifying Jesus Christ and to convict these men of their sin.

Verses 13, 14, 15 contain the charges, whereof Peter and John were "witnesses." They were not to look upon "us" as though they had done anything, nor was it some new God of whom they witnessed (v. 13). The act of the crucifixion, he grants, may have been consummated in ignorance (v. 17), but since God had raised Jesus from the dead, and this doctrine of the resurrection was new, therefore they ought to repent even though their acts were in accord with prophecy.

Peter appeals to Jewish pride. Is such an appeal legitimate?

WITH OUR ADVERTISERS.

A Good Agency Proposition.

A KRAMER rotary harrow, hitched behind your plow, insures a moist, finely pulverized seed bed, which in turn means quick germination preventing lost seed. You can do your disking, leveling and pulverizing all in one operation and they are of such light draft that they do not require extra pulling power. A big illustrated folder and special agency proposition will be sent you if you will write to Kramer Rotary Harrow Co., 215 Main St., Morton, Ill., and mention their advertisement on page 14.—Adv.

Some Good 1914 Seed Corn.

THE Dakota Improved Seed Co., of Mitchell, S. D., handlers of "Disco" guaranteed seeds, are advertising on page 15 a limited amount of fine 1914 seed corn at special prices. By ordering promptly they claim that you can save money and be sure of getting some of the few thousand bushels of A. No. 1 seed which they carried over from last year and which is guaranteed to produce excellent results, because of its extra high vitality. Please mention this paper and address Dakota Improved Seed Co., 27 Main St., Mitchell, S. D. —Adv.

Mankato Incubators Delivered Quickly.

MANKATO incubators are quickly delivered after an order is received, all vexatious delays being eliminated. For twenty years they have been building incubators that have given satisfaction wherever used and there are thousands in use. The New Mankato incubator sells for $7.25 and has all kinds of incubator refinements and the best of construction. A postal card addressed to Mankato Incubator Co., Box 708 Mankato, Minn., will bring their big free incubator book and catalog to you. In writing them kindly mention their advertisement on page 23.—Adv.

Over Sixty Years in the Nursery Business.

EVERBEARING strawberries, which fruit from early summer till November, are one of the specialties offered by Kellogg's Nurseries in their advertisement on page 15. This concern has been in the business over sixty years and Kellogg's Hardy Northern grown fruit has a well-deserved reputation for big productivity and strength. A free price list and book of instructions will be sent on application to Kellogg's Nursery, Box 224, Janesville, Wis. In writing please mention this paper.—Adv.

Extra Good Wheat and Oats.

THE Farmer Seed & Nursery Co., of Faribault, Minn., is featuring its Bumper Crop oats and Genuine Marquis wheat in its advertisement on page 14. The former is said to produce exceptionally heavy, white grains, which will weigh forty-five pounds to the measured bushel, while the latter has yielded forty bushels to the acre. Their seed comes from pure strains and is full of strength and vigor. Samples and illustrated seed book will be sent free to anyone addressing Farmer Seed & Nursery Co., 104 Third Ave., Farlbault, Minn., and mentioning this paper. —Adv.

A Liberal Nursery Offer.

THE Gardner Nursery Co., of Osage are making a liberal and interesting proposition in their advertisement on page 14. They offer to send a pair of mated everbearing strawberry plants to anyone who will agree to report their success with them, enough of the new Cereal Feterita to plant a rod square, and a package of perennial Oriental poppy seed free on request. They say that if you feel like doing so you can send 10 cents for the mailing expense, but yon don't have to. They just want to get acquainted with you. You can take advantage of this very fair offer by writing today to the Gardner Nursery Co., Box 730, Osage, Iowa. Mention of their advertisement in this paper would be appreciated.—Adv.

Making the Horse a Luxury.

WHEN you can get a tractor for $550 that will haul anything a horse can on fields or roads, and will also run all your farm machinery, you can hardly afford to use a horse. That is what is claimed for the "Happy Farmer" tractor, which is advertised on page 15. It is said to be unusually light in construction but exceptionally durable, because of a practically all steel construction. It is simple in design and so arranged that 88 per cent of the weight is on the drive wheels. Further information about this new, light tractor, together with agents' terms and territory, will be sent on inquiry addressed to Happy Farmer Tractor Co., 330 Third Ave., Minneapolis, Minn. When writing please mention this paper.—Adv.

Salzer's Seed Catalog.

FOR nearly half a century John A. Salzer's Seed Co., of La Crosse, Wis., has stood for quality in farm and garden seeds. During these years their annual seed catalog has been a standard in thousands of homes. It contains 184 pages of seed wisdom and a postal card request will bring it to you at once. In their advertisement on page 14 some of their high quality seeds are enumerated, including their oats, which are of a registered, pedigreed variety, warmly endorsed by agricultural stations, their high-grade and high-testing Minnesota and Wisconsin grown seed corn, their alfalfa, sweet clover and other hardy, big producing grasses. They are offering thirty-five packages of earliest vegetable seeds for $1.00. For further information address John A. Salzer's Seed Co., Box 123, La Crosse, Wis., and kindly refer to this paper.—Adv.

A Splendid Grass Mixture.

A SEED mixture of fully one-third alsike clover and the balance timothy clover for $5 a bushel is one of the special bargains offered by the A. A. Berry Seed Co., of Clarinda, Iowa, in their advertisement on page 15. This is said to be one of the greatest hay and pasture combinations grown. A free sample, together with their 100-page catalog, describing this wonderful grass mixture and others of their tested, recleaned and guaranteed seeds, will be sent on request to A. A. Berry Seed Co., Box 534, Clarinda, Iowa. Mention of this paper in writing will be appreciated.—Adv.

Firestone Tires Have New Color Design.

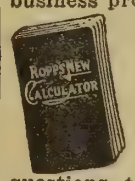
FROM now on you can easily distinguish Firestone tires by their color combination of red and black. They will have red side walls and black treads, and they lend a distinctive appearance to any car. If you will send the name of your dealer and the make of your tires to the makers they will forward you free one of their cementless tube patches, which is likely to come in handy some day. Ask also for a copy of their interesting new booklet, "Mileage Talks," No. 17. Address Firestone Tire & Rubber Co., Akron, Ohio, and please mention their advertisement on page 15.—Adv.

A Practical Ditcher and Grader.

MARTIN farm ditchers and road graders are useful in many ways. They are, of course, designed primarily for cutting ditches and grading country roads, and they do this work easily, in a common sense manner. They are handy to use in terracing and in cleaning out laterals. They are built entirely of steel and are so simple and practical that they do the work of much larger machines, costing four times as much money. You can learn about them and also about their special introductory proposition by writing Owensboro Ditcher & Grader Co., Box 861, Owensboro, Ky., and mentioning their advertisement on page 12.—Adv.

Two Books for Every Farmer.

ROPP'S New Calculator is a competent and accurate authority in the matter of short cuts to the solution of business problems of every description.



It covers every problem liable to come up on the farm, in the home, buying or selling, interest or discount, total of sales in dollars, exact amounts to be paid in wages, or amounts due for products. There are hundreds of answers aside from the common questions to be decided daily. The "Square Deal" fence book describes in detail how Square Deal fencing is made —why it is different from all others, and the fence you should put up. Both of these valuable books are sent by the Keystone Steel & Wire Co., 638 Industrial St., Peoria, Ill., to all who send name and address and who did not receive a copy of these books last year. In writing please mention this paper. See page 20.—Adv.

SUGAR FACTORY TO OPEN.

There is again talk of opening up the plant of the Rock County Sugar Company this year. This plant was closed down by Captain James Davidson, the owner and manager, when the present tariff law went into effect. Captain Davidson claimed that it was impossible to make the plant pay under the new tariff. The factory was closed down before the European war, which put quite a different aspect on the sugar business. The predicted slump in the price of sugar to follow the new tariff law did not come. On the contrary sugar raised in price after war was declared in Europe. Captain Davidson thinks it will pay to operate the Janesville plant and an effort is being made to interest farmers in raising more beets this year.

HONORS AT GRAIN SHOW.

There were 150 exhibitors at the recent grain show held in connection with the farmers' institute in Manitowoc county. A. H. Bauer, residing on Route 2, Manitowoc, won the silver loving cup offered to the exhibitor securing the largest number of points in the competition.

Farmers from near Stoughton, Dane county, met recently in Madison and discussed the advisability of supporting a condensary. Such a plant as is proposed for Stoughton would employ about twenty-five men.

The funeral of George Cannon, 89 years old, who, in 1863 and 1865 won the plowing championship of all England, took place recently. He was employed at Simplemarsh Farm, Addlestone, for more than fifty years, and continued working at Chertsey till he was past 77.

Only
$1.00
—and After Trial!

YES, the great New Edison with the new Diamond Stylus reproducer and your choice of all the brand new Diamond Amberol Records will be sent you on **free trial without a penny down.** The **finest,** the **best** that money can buy at very very much less than the price at which imitations of the genuine Edison are offered—**a rock-bottom offer *direct* from us.**

HEPSEY BURKE—A Sister to David Harum

By F. N. Wescott, the Brother of the Author of "David Harum."

(Copyright 1915.)

SYNOPSIS.

Hepsey Burke with the Junior Warder met the new pastor, Donald Maxwell, at the depot, giving him a welcome to his new parish. During the ride out to Thunder Cliff, Hepsey's home, she gave Maxwell in her outspoken way a very clear idea of the requisites or, as she put it, what the "parish wanted in the shape of a pastor."

CHAPTER II.

Gossip.

THAT afternoon Maxwell occupied himself in unpacking his trunk and arranging his room. As the finishing touch, he drew out of a leather case an exquisite miniature of a beautiful girl, which he placed on the mantelpiece, and at which he gazed for a long time with a wistful light in his fine gray eyes. Then he threw himself on the lounge, and, pulling a letter from his inner pocket, read:

"Don't worry about expenses, dear. Six hundred is quite enough for two; we shall be passing rich! You must remember that, although I am a 'college girl,' I am not a helpless, extravagant creature, and I know how to economize. I am sure we shall be able to make both ends meet. With a small house, rent free, a bit of ground for a vegetable garden, and plenty of fresh air, we can accomplish almost anything, and be supremely happy together. And then, when you win advancement, as, of course, you will very soon, we shall appreciate the comforts all the more from the fact that we were obliged to live the simple life for a while.

"You can't possibly imagine how I miss you, sweetheart. Do write as soon as possible and tell me all about Durford. If I could just have one glimpse of you in your new quarters—but that would only be a wretched aggravation; so I keep saying to myself 'Some day, some day,' and try to be patient. God bless you and good-by."

Donald folded the letter carefully, kissed it, and tucked it away in his pocket. Clasping his hands behind his head he gazed at the ceiling.

"I wonder if I'd better tell Mrs. Burke about Betty. I don't care to pass myself off as a free man in a parish like this. And yet, after all, it's none of their business at present. I think I'd better wait and find out if there's any possibility of making her happy here."

There was a knock at the door.

"Talk of angels," murmured Maxwell, and hurriedly returned the miniature to its case before opening the door to Mrs. Burke, who came to offer assistance.

"Don't bother to fuss for me," she said as he hastened to remove some books and clothes from a chair, so that she might sit down. "I only came up for a moment to see if there was anything I could do. Think you can make yourself pretty comfortable here? I call this room 'the prophet's chamber,' you know, because it's where I always put the visitin' parsons."

"They're lucky," he replied. "This room is just delightful with that jolly old fireplace, its big dormer windows and the view over the river and the hills beyond. I shall be very comfortable."

"Well, I hope so. You know I don't think any livin' room is complete without a fireplace. Next to an old friend, a bright wood fire's the best thing I know to keep one from getting lonesome."

"Yes—that and a good cigar."

"Well, I haven't smoked in some time now," Mrs. Burke replied, smiling, "so I can't say. What a lot of things you've got!"

"Yes, more than I thought I had."

"I do love to see a man tryin' to put things to rights. He never knows where anything belongs. What an awful lot of books you've got! I suppose you're just chuck full of learnin', clean up to your back teeth, but we won't any of us know the difference. Most city parsons preach about things that are ten miles over the heads of us country people. You can't imagine how little thinkin' most of us do up here. We're more troubled with potato bugs than we are with doubts, and you'll have to learn a lot about us before you really get down to business, I guess."

"Yes, I expect to learn more from you than you will from me. That's one of the reasons why I wanted to come so far out in the country."

"Hm! I hope you won't be disappointed."

Mrs. Burke adjusted her glasses and gazed interestedly about the room at some pictures and decorations which Maxwell had placed in position, and inquired:

"Who is the plaster lady and gentleman standin' on the mantelpiece?"

"The Venus de Milo and the Hermes of Praxitetes."

"Well, you know, I just can't help preferrin' ladies and gentlemen with arms and legs, myself. I suppose it's real cultivated to learn to like parts of people done in marble. Maybe when I go down to the city next fall to buy my trousseau I'll buy a few plasters myself to make the house look more cheerful-like."

Maxwell caught at the word "trousseau," and as Mrs. Burke had spoken quite seriously he asked:

"Are you going to be married, Mrs. Burke?"

"No such thing! But when a handsome young widow like me lives alone, frisky and sixty-ish, with six lonesome, awkward widowers in the same school district, you can never tell what might happen any minute; 'In time of peace prepare for war,' as the paper says."

Maxwell laughed reassuringly.

"I don't see why you laugh," Mrs. Burke responded, chuckling to herself. "'Taint polite to look surprised when a woman says she's a-goin' to get married. Every woman under ninety-eight has expectations. While there's life there's hope that some man will make a fool of himself. But unless I miss my guess, you don't catch me surrenderin' my independence. As long as I have enough to eat and am well I'm contented."

"You certainly look the picture of health, Mrs. Burke."

"Oh, yes! as well as could be expected, when I'm just recoverin' from a visit from Mary Sam."

"What sort of a visitor is that?" asked Maxwell, laughing.

"Mary Sam is my sister-in-law. She spends a month with me every year on her own initation. She is what you'd call a hardy annual. She is the most stingy and narrow-minded woman I ever saw. The bark on the trees hangs in double box-plaits as compared with Mary Sam. But I got the best of her last year. While I was cleanin' the attic I came across the red pasteboard sign with 'Scarlet Fever' painted on it, that the Board of Health put on the house when Nickey had the fever three years ago. The very next day I was watchin' the 'bus comin' up Main Street, when I saw Mary Sam's solferino bonnet bobbin' up and down inside. Before she got to the house I sneaked out and pinned up the sign, right by the front door. She got onto the piazza, bag and baggage, and brown paper bundles, before she caught sight of it. Then I wish you could have seen her face. I wouldn't have believed so much could be done with so few features."

"She didn't linger long?" laughed the parson, who continued arranging his books while his visitor chatted.

"Linger? Well, not exactly. She turned tail and run lickety-spindle back to the 'bus as if she had caught sight of a subscription paper for foreign missions. I heard Jim Anderson, who drives the 'bus, snicker as he helped her in again, but he didn't give me away. Jim and I are good friends. But when she got home she wrote to Sally Ramsdale to ask how Nickey was, and Sally, not bein' onto the game, wrote back that there was nothin' the matter with Nickey that she knew of. Then Mary Sam wrote me the impudentest letter I ever got, and she came right back and stayed two months instead of one, just to be mean. But that sign's done good service since. I've scared off agents and tramps by the score. I always hang it in the parlor window when I'm away from home."

"But suppose your house caught fire while you were away?"

"Well, I've thought of that, but there's worse things than fire if your insurance is all right."

Mrs. Burke relapsed into silence for a while, until Maxwell opened a box of embroidered stoles, which he spread out on the bed for her inspection.

"My! but aren't those beautiful! I never saw the like before. Where did you get 'em?"

"They were made by the 'Sisters of St. Paul' in Boston."

Hepsey gazed at the stoles a long time in silence, handling them daintily, then remarked:

"I used to embroider some myself. Would you like to see some of it?"

"Certainly, I should be delighted to see it," Donald responded; and Mrs. Burke went in search of her work.

Presently she returned and showed Maxwell a sample of her skill—doubtless intended for a cushion cover. To be sure it was a bit angular and impressionistic. Like Browning's poems and Turner's pictures, it left interesting room for speculation. To begin with, there was a dear little pink dog in the foreground, having convulsions on purple grass. In the middle-distance was a lay-figure in orange, picking scarlet apples from what appeared to be a revolving clothes-horse blossoming profusely at the ends of each beam. A little blue brook gurgled merrily up the hill and disappeared down the other side only to reappear again as a blue streak in an otherwise crushed-strawberry sky. A pumpkin sun was disappearing behind emerald hills, shooting up equidistant yellow rays, like the spokes of a cartwheel. Underneath this striking composition was embroidered the dubious sentiment "There is no place like home."

Maxwell examined carefully the square of crossstitch wool embroidery, biting his lip; while Hepsey watched him narrowly, chuckling quietly to herself. Then she laughed heartily and asked:

"Confess now, don't you think it's beautiful?"

Donald smiled broadly as he replied:

"It's really quite wonderful. Did you do it yourself?"

"To be sure I did, when I was a little girl and we used to work in wool from samplers, and learn to do alphabets. I'm glad you appreciate it. If you would like to have me embroider anything for the church don't hesitate to ask me." She busied herself examining the stoles again, and asked:

"How much did these things cost, if you don't mind my askin'?"

"I don't know. They were given to me by a friend of mine, when I graduated from the Seminary."

"Hm! a friend of yours, eh? She must think an awful lot of you."

Hepsey gave Donald a sharp glance.

"I didn't say it was a lady."

"No, but your eyes and cheeks did. Well, it's none of my business and there's no reason that I know of why the devil should have all the bright colors and embroideries and things. Are you High Church?"

Maxwell hesitated a moment and replied:

"What do you mean by 'High Church?'"

"The last rector we had was awful high." Hepsey smiled with reminiscent amusement.

"How so?"

"We suspected he didn't wear no pants durin' service."

"How very extraordinary! Is that a symptom of ritualism?"

"Well, you see he wore a cassock under his surplice, and none of our parsons had ever done that before. The Senior Warden got real stirred up about it and told Mr. Whittimore that our rectors always wore pants durin' service. Mr. Whittimore pulled up his cassock and showed the Warden that he had his pants on. The Warden told him it was an awful relief to his mind, as he considered goin' without pants

FISH eaters beware! Order only strictly fresh weather-frozen fish, such as we ship. Direct from the waters to you. Herring in sacks $3.25 per 100 lbs., in boxes $3.50 per 100 lbs. Pike $9.25. durin' service the enterin' wedge for Popish tricks; and if things went on like that, nobody knew where we would land. Then some of the women got talkin', and said that the rector practiced celibacy, and that someone should warn him that the parish wouldn't stand for any more innovations, and he'd better look out. So one day Virginia Bascom, the Senior Warden's daughter, told him what was being said about him. The parson just laughed at Ginty, and said that celibacy was his misfortune, not his fault; and that he hoped to overcome it in time. That puzzled her some and she came to me and asked what celibacy was. When I told her it was staying unmarried, like St. Paul—my, but wasn't she mad, though! You ought to have seen her face. She was so mortified that she wouldn't speak to me for a week. I must go and make my biscuits for supper. If I can help you any just call out.

(To be continued.)

VETERINARY MATTERS.

AILING ANIMALS.

Fistula.

Is there any cure for fistula and poll evil before they break and run? If not before, what is the best cure after they break? Kindly give me the best information you can obtain. If the cure is not permanent, can it be driven back by blistering, and for how long?

If taken when purely an acute inflammation it may be overcome by a counter irritant. If pus has formed in swelling it is not advisable to apply blistering agents, as it will only tend to cause pus to burrow deeper into the tissues. The pus cavity should be opened at the lowest point at the earliest moment and free drainage given. If the cavity has opened naturally it is best to have a competent veterinarian handle the case and use radical means, as it usually resolves itself into this sooner or later. The use of bacterins have proven a great help in the treatment of fistula. Fistulas are not all alike and, therefore, it usually calls for a competent man to make an examination before intelligent treatment can be carried out.

Chronic Bloating (Tympanites).

I have a black Polled Angus two-year-old bull that first got bloated last fall on a small patch of alfalfa. I had a veterinarian here and he tapped him and has sent out different medicines a couple of times since then. He gets bloated every day so that I have to tap him two and three times a day. He seems to be all right otherwise. He eats and drinks the same as he ever did.

While you give only a limited number of symptoms, it seems probable your bull is subject to chronic bloating following an acute attack of bloating. This is found quite often among cattle. Give the animal a moderate dose of purgative medicine, one pound of sulphate of magnesia, one-half ounce powdered barbadoes aloes and one ounce of powdered ginger. Put this in two quarts of lukewarm water and give as drench. After operation of the purgative try the following tonic: Powdered gentian, three ounces, powdered bicarbonate of potash, three ounces, powdered ginger, three ounces, powdered capsicum, one ounce. Mix and divide into twelve powders. Give one in water as drench three times a day before feeding. Give plenty of exercise and clean, wholesome food. Instead of using the trocar so often try the use of two ounces of aromatic spirits ammonia in a quart of water, repeated in a half hour if necessary. Also move animal around to help relieve bloat. If followed out closely the above directions and remedies may prove of some benefit.

HENNEPIN COUNTY JERSEY BREEDERS.

At a meeting of the Hennepin County Jersey Cattle Breeders at Minneapolis, Minn., an organization was perfected for the bettering of the Jersey cattle business in Hennepin county. The Hennepin County Jersey Cattle Club was formed with a membership of twenty-five. C. R. Brackett was elected president; J. W. Love, vice president; G. A. Chaffee, secretary and treasurer. The Jersey breeders of Hennepin county expect great results from this organization.

Three Hundred Million Bushel Crop in 1915

Farmers pay for their land with one year's crop and prosperity was never so great.

Regarding Western Canada as a grain producer, a prominent business man says: "Canada's position today is sounder than ever. There is more wheat, more oats, more grain for feed, 20% more cattle than last year and more hogs. The war market in Europe needs our surplus. As for the wheat crop, it is marvelous and a monument of strength for business confidence to build upon, exceeding the most optimistic predictions."

Wheat averaged in 1915 over 25 bushels per acre
Oats averaged in 1915 over 45 bushels per acre
Barley averaged in 1915 over 40 bushels per acre

Prices are high, markets convenient, excellent land low in price either improved or otherwise, ranging from $12 to $30 per acre. Free homestead lands are plentiful and not far from railway lines and convenient to good schools and churches. The climate is healthful. **There is no war tax on land, nor is there any conscription.** For complete information as to best locations for settlement, reduced railroad rates and descriptive illustrated pamphlet, address

Gordon's Holsteins.

ONE of the most progressive breeders of dairy cattle in southern Wisconsin is J. Roy Gordon, Mineral Point, Wis. He has been actively engaged in breeding pure-bred Holsteins for many years and has developed an excellent herd of high-producing animals of good straight type and of proven blood lines. Mr. Gordon is a graduate of the college of agriculture, being a member of the class of 1900. He tells with a great deal of pleasure of his personal association with Dr. Babcock, inventor of the famous Babcock test; Dean Henry, author of "Feeds and Feeding"; Professor King, inventor of the King System of Ventilation, and others who were the pioneers in scientific methods of agriculture. The writer recently spent a most pleasant day at this farm and while there looked over the herd of Holsteins which consists of some sixty head. There are several which have advance registry records of merit. There are two bulls in service, viz.: Pontiac Cornucopia Coronis and Ostego Korndyke Hengerveld De Kol. Pontiac Cornucopia Coronis has fifteen A. R. O. daughters with creditable records, one being a twenty-five-pound three year old. His sire is Pontiac Cornucopia, that has twenty-three A. R. O. daughters, eight with records over twenty pounds. His dam Pontiac Coronis is a 27.60, 5 per cent daughter of Hengerveld De Kol, that has 116 A. R. O. daughters, eight over thirty pounds, seventy-two with records over twenty pounds. His sire's sire is Aaggie Cornucopia Johanna Lad, that has 101 A. R. O. daughters, fifty-three with records from twenty to thirty-two pounds. Ostego Korndyke Hengerveld De Kol is a grandson of Pontiac Korndyke that has 100 A. R. O. daughters, eight with records from thirty to thirty-eight pounds butter in seven days. Among the females in the herd are ten yearling heifers, which are worthy of special mention. They are both well bred and of good, straight conformation, showing also great capacity and constitution. They are especially noticeable because of the extraordinary udder development and long, smooth teats. These were sired by Queen of the Pines Aaggie, whose dam is a 26.03-pound daughter of Dutchland Sir Pontiac Rag Apple. At the present time Mr. Gordon has a number of choice bulls for sale out of A. R. O. cows and sired by Pontiac Cornucopia Coronis. They are from one-half to seven-eighths white and of good type. For pedigrees and description write to the above address. See page 39.—Adv.

E. W. Hendricks' Poland China Sale.

IT will be a big-type sale of quality which E. W. Hendricks, Hazel Green, Wis., will hold on Thursday, February 10th, and one which our readers cannot afford to miss. The writer recently had the privilege of looking over the offering and was impressed with the type of the individuals and the breeding. He saw here one of the largest boars of the breed—Black Jumbo, that in show shape weighs 1,100 pounds. He is not only of exceptionally large size, but he is a good individual with eleven inch bone, great width and depth and a strong back. Five fall yearlings and four mature sows and twenty-seven spring gilts offered in the sale were sired by him. There are four fall yearlings by the $1,000 boar, Oakland's Equal, three proven sows by Giant Big Bug by J. C. Big Bug by Big Bone, two of these are out of daughters of Fesenmeyer's noted boar, A Wonder. There are also a number of spring gilts by Great Leader, a son of E. A. Fraser's 1,055-pound boar, Tecumseh Leader. Some by Peerless Wonder by A Wonder. The gilts are well developed, with heavy bone, wide, smooth, strong backs, short, wide heads, deep sides and thick, well let down hams. They are bred for spring litters to Big Oakland, Long Joe and R.'s Wonder. Big Oakland is a son of Irwin's $1,000 boar, Oakland's Equal and out of an A Wonder dam. Long Joe is by Big Special and out of a daughter of Fesenmeyer's boar, Big Joe. R's Wonder is by Rood's A Wonder, a son of A Wonder and out of a daughter of Peter Mouw's $1,500 boar, Longfellow Jr. These gilts are, therefore, not only well bred themselves, but carry litters that are by excellent individuals of known breeding. Catalogs giving breeding and description are now ready for distribution. Send for one at once and look it over carefully. Make your selections and if impossible to attend the sale in person send a mail bid to the auctioneer or to H. S. Hoard, representative of The Wisconsin Farmer. See advertisement on page 37.—Adv.

Madson's Poland China Sale.

FRIDAY, February 11th, is the date of the Wisconsin Poland China Breeders' Annual meeting and Madson's bred sow sale, both to be held at Madison, Wis. These are two events that every Wisconsin Farmer reader interested in Poland China swine should attend. The coming year promises to be the greatest in history for breeders of pure breds. There are several factors combining to make breeding very profitable. Firstly, the farmers and breeders have shipped all of their inferior and mediocre breeding animals for pork. This will create a heavy demand next fall, in addition there has been such a rush of light hogs, (from sixty to 150 pounds) on to the market that pork will be high next fall. High pork prices always stimulate a heavy demand for breeding stock. The offering in this sale is of high merit. They are excellent individuals, combining good type, large size with the desirable good quality. They are also well bred along proven blood lines, being sired by boars that have won high honors in the show ring under critical judges and against heavy competition. In addition every animal is cholera immune, having been given the double treatment. This is a factor of immense importance to every breeder whether he thinks he is in danger or not. I said that the animals are good individuals, and I leave it to you to decide. Many of the spring gilts now weigh 275 pounds and will touch 400 pounds by sale date. They have good, wide, strong backs, deep, heavy hams; deep barrels and well up on feet. The majority of the spring gilts were sired by Correct I Am, junior champion boar at the 1914 Minnesota and Illinois State Fairs against heavy competition. His sire was Correct I Know, grand champion at the South Dakota State Fair. The fall gilts were sired by Royal Model and Badger Perfection, that sired the 1913 grand champion sow. These sows are bred for March and April farrow to Triumph, an exceptionally good big-type boar declared by Lovejoy and McFadden to be an outstanding animal. He was sired by Hidestretcher, grand champion at the 1914 Wisconsin State Fair. The sale will be held at Dr. J. P. West's Veterinary Barn, 735 East Washington Avenue, five blocks from the C. & N. W. and east side C., M. & St. P. railway stations. It will, therefore, not be necessary to drive over drifted roads through cold heavy winds in case it storms. The sale will be held in a well heated, lighted and seated building where it will be perfectly comfortable regardless of the weather. Catalogs giving descriptions and breeding are now ready and will be mailed on application. Send for a catalog and look it over carefully. Plan to attend the sale if possible, but if impossible make your selections from the catalog and send a mail bid to either the auctioneer, Ira Cottingham, or H. S. Hoard, care of The Wisconsin Farmer, Madison, Wis. See page 37.—Adv.

A Very Popular Horse.

IF some candidates for office were able to attain the popularity of a certain race horse, which made a pacing record of 1:55, they would have no trouble in securing the offices for which they are running. This horse is so popular that over 2,000,000 people wrote and asked his owner for a picture of him and these pictures are now hanging in homes and offices all over the world. He is not only popular among the mass of people on account of his ability to win races and break world's records time after time, but he is also popular with his caretakers on account of his remarkably gentle and loving disposition. This horse seems to possess almost human intelligence and is remarkable in many ways. He has broken world's records fourteen times and while it may be that some day some horse may pace faster than he, it is conceded that for any horse to break as many records as this one has would be practically impossible. It is needless to mention the name of this horse, as it is known to every man, woman and child in the land. See advertisement of International Stock Food Co., Minneapolis, Minn., on page 24 this paper. Please mention this paper when you write them.—Adv.

Atwater's Duroc Sale.

THE annual Duroc bred sow sale of L. F. Atwater, Bangor, Wis., will be held on Tuesday, February 1st. This annual sale is an event looked forward to by Duroc breeders throughout this territory as one of the big events of the breed. The winnings of this herd at the Wisconsin and Minnesota State Fairs has placed it as one of the best herds in this territory. For several years he has won both grand, first and second prizes at the Wisconsin State Fair. The offering of sows and gilts in this sale is practically of grand champion blood. The majority of them are daughters or are out of daughters of Lee's Defender, grand champion at the 1914 Wisconsin State Fair. These are bred to Prince Illustrator, grand champion at the 1915 Wisconsin State Fair. He is by Model King of High Model by Golden Model 2d. A part of the other gilts are sired by Corrector, first-prize junior yearling at the 1914 Wisconsin State Fair, some by Lucky Col. and by Select Advancer. These are bred to Lee's Defender, a combination which should produce some excellent results. The gilts in addition to being of proven breeding are of superior type and well developed. They have been produced by careful mating of typey, well-developed animals of known and proven worth; in addition they have been well fed and cared for, not being allowed to be stunted at any time. Catalogs giving pedigrees and description are now ready for distribution. Write for one at once and look over the breeding. Attend this sale if possible, or send a mail bid to H. S. Hoard, representative of The Wisconsin Farmer. See advertisement on page 36.—Adv.

Paid for Incubator With First Hatch.

A GOOD incubator will pay for itself the first hatch if the hatch is made early so that the chickens can go on the market while prices are good. Last season the Logan Valley Poultry Farm, of Wayne, Neb., set a Radio-Round Incubator the second week of February with eggs which were gathered the last week in January and the first week in February. The hatch was good, considering the fact that in extremely cold weather many eggs are chilled before they can be gathered. When twenty-four hours old chicks were transferred to a Radio Brooder. On May 20th, when eleven weeks old, they were sold on the market as broilers. After paying for the incubator, the setting of eggs, feed and bedding for the chicks and oil for incubator and brooder, the owner of the incubator had $4.95 left from the proceeds of the hatch, besides five chicks on hand that he had not sold. The profits would have been considerably more had he not had bad luck and lost eleven chicks. Full details of the costs and profits of this hatch may be had by writing to the Radio-Round Incubator Co., Drawer 9, Wayne, Neb., and asking for Book No. 38. Please mention this paper when writing.—Adv.

Avoid Sled and Sleigh Tips.

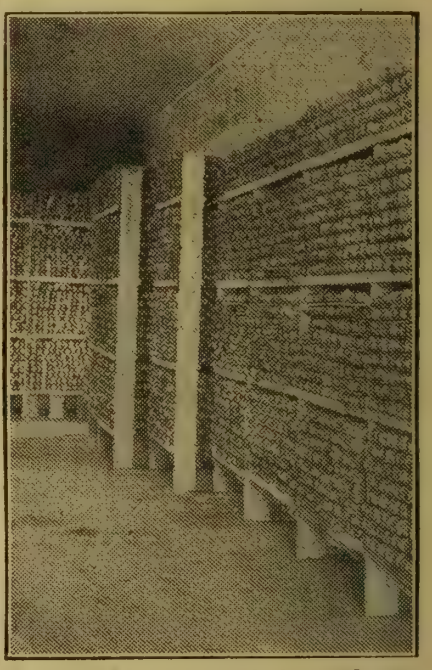
WEST BEND anti-tip sleigh runners are a sure guarantee against tipping over. The runners turn on pivots just below the beam, keeping the load directly over the runners, no matter how the team is turned. They also pull out of ruts much easier than the old-fashioned runners, take backing strain off the runners and distribute it evenly, making backing much easier, dodge obstructions easily and are very durable. They have been thoroughly tested and proven and are made by the old reliable Schmidt & Stork Wagon Co. In writing them for information about their anti-tip runners, inquire also about their "Light Running" West Bend wagons. Address Schmidt & Stork Wagon Co., Dept. 123, West Bend, Wis., and kindly mention their advertisement on page 18.—Adv.

"Hatching Facts" a Valuable Handbook.

THE booklet entitled "Hatching Facts," which the Belle City Incubator Co., of Racine, Wis., is offering to send free to anyone answering its advertisement on page 23, gives the story of many championship winners, told in their own words about their victories in hatching contests with Belle City incubators. It contains 100 photographs of these winning hatches, together with all sorts of valuable and interesting information about incubator and brooder construction. It is said of the Belle City machine that "it incubates in all states," there being over 400,000 in use. A postal card addressed to Jim Rohan, Pres. Belle City Incubator Co., Box 106, Racine, Wis., will bring you this handbook of practical hatching information, together with his personal ten-year guarantee propositiin. In writing please mention this paper.—Adv.

Stubbs & Hyzer's Duroc Sale.

EVERY reader of The Wisconsin Farmer who breeds pure-bred or grade Duroc swine or has "a leaning" that way, is advised to attend the sale of bred Duroc sows to be held by Stubbs & Hyzer, West Salem, Wis., Monday, January 31st. The demand for breeding stock next fall will undoubtedly be the largest ever experienced in this territory. Practically every farmer and many breders have shipped all of their hogs onto the market because of the poor corn crop. This meais that they will have to buy breeding stock later in the year. In addition to this the price of pork promises to be very high, which always stimulates a big demand for breeding animals. For these reasons every breeder of Duroc swine should be in a position to supply this heavy demand, which is sure to come. The animals offered for sale are of the best both in breeding and as individuals. In fact, they represent blood lines that have proven of exceptional quality. The offering consists of eighteen tried sows and thirty-two spring gilts, ten of these were sired by King the Colonel. This boar is the premier sire of the Colonel family. He has more 1,000-pound sons than any other boar of any breed. His daughters are also of exceptional merit, which is shown by the prices they were sold for. In 1915 thirty-five daughters of King the Colonel in nineteen different sales sold at an average of $140.60. There are eight sows sired by a son of the King the Colonel; two by Lee's Defender, grand champion at the 1915 Wisconsin State Fair; fifteen of Golden Model breeding and six of Defender breeding. The sale will he held on the farm, which is only three blocks from both the C., M. and St. P. and C. & N. W. Ry. stations. Everyone will be comfortable, regardless of weather conditions, as it will not be necessary to drive over drifted roads. If impossible to attend the sale in person, send a mail bid to the auctioneer, I. E. Stickelman, or to H. S. Hoard, of The Wisconsin Farmer. See page 35.—Adv.



A CORNER in one of the seed corn drying rooms of the Vermilion Seed Co., Vermilion, S. D. This firm has several thousand bushels of early picked and carefully dried seed which is testing high in germination. Note their advertisement on page 15.

Wisconsin Incubator and Brooder for $10.

WISCONSIN incubators and brooders offered on page 23, are shipped, freight prepaid, for only $10 for both machines. They are constructed of California Redwood and are guaranteed for ten years. They come to you complete, ready to run and are sold on thirty days' free trial. The 180-egg incubator and brooder of the same make sell for $12, and both machines are sold on a guarantee of money back if not satisfactory. They have proven their ability to produce results both in practical use and in national hatching contests. If you will send a postal card

to the Wisconsin Incubator Co., Box 102, Racine, Wis., and mention their advertisement on page 23, you will receive their new 1916 catalog by return mail.—Adv.

Shekleton's Draft Horses.

FRANK P. SHEKLETON & SONS, well-known importers and breeders of Percheron, Belgian and Clydesdale stallions and mares, under recent date write as follows: "We are enjoying a very brisk stallion and mare trade and are looking forward to the best year we have had since engaged in the horse business. We have had inquiries from seven states and feel fortunate in having such a large collection of high-class drafters for our customers. Horse buyers who visit our barns say that we have the best bunch of young stallions that they have seen this year. Within the last few weeks buyers have been here nearly every day. We have sold to Mr. Likley, Strawberry Point, Iowa, a well-bred four-year-old Percheron mare. Mr. Likley is founding a herd of registered Percherons and buys nothing but the best. John Meyers, Graceville, Minn., was looking for a low-down, blocky Percheron stallion and found what he wanted in the thick, massive Prosper. Mr. Meyers has taken a great step forward in the upbuilding of the Percheron horse in his county and deserves the hearty support of the farmers in his community. S. Allen, Rudd,

LINCOLN MODEL 133864, first prize Sioux City Interstate Fair, first prize Nebraska State Fair, second prize Wisconsin State Fair, first prize and champion over all breeds at six leading county fairs. The sows and gilts in Stubbs & Hyzer's Duroc sale are bred to this boar. See advertisement on this page.

Iowa, purchased four black imported Percheron mares weighing nearly a ton each, all in foal, and while Mr. Allen paid a long price for these mares we know that with his enterprise and push he is sure to make a go of the business. Warrior, a low-down, dapple-gray, three-year-old Percheron stallion, goes to Theo Rake, Algona, Ia., and we want to say that Warrior is a grandly bred horse, a showy fellow, and cannot help but do his community a lot of good. Boudonnis, a rising five-year-old, dapple-gray Percheron, goes to Bert Powell, Genoa, Wis. Mr. Powell was looking for a draft stallion and a show stallion and we believe he has the combination in this horse. Owen Bunn, Fredericksburg, Iowa, purchased the imported Belgian stallion that we have considered one of the best we ever owned. This stallion is a tried sire and cost Mr. Bunn a lot of money. We still have a large collection of horses on hand and can suit the most critical judge. We have stallions that weigh up to 2,400 pounds and two year olds that will weigh a ton." Anyone interested in a good stallion or mare should see the advertisement on page 36 and write this firm, kindly mentioning this paper.—Adv.

Smiley's Oxford Sheep.

OXFORD ewes and ram lambs are advertised for sale on page 38 by William Smiley & Son, Albany, Wis. They have an excellent flock, the individuals from which have given excellent satisfaction wherever sold. They are now offering sixty ewes, ranging in age from ewe lambs to matured animals and fifteen ram lambs. There are ten yearling ewes, fifteen ewe lambs, seven two year olds, four three year olds and twenty-three matured animals all with full mouth. The older ewes are the ones that have produced their fine show animals. These sheep are in their everyday clothes, just in good, thrifty condition. Thirty-three of them are due in March and the balance in April. They are bred to Cowley President 2d, a Horlick lamb by Cowley's Hunch. He is a splendid individual, big, wide and even, of good Oxford type and well wooled. The ewe and ram lambs were sired by Smileys Jumbo, a ram of high individual merit, weighing 290 pounds in ordinary breeding condition and fitted for show would weigh 350 pounds. With the present outlook for wool the entire flock would produce about $2.50 worth per head. The outlook for sheep breeding is very promising, owing to the high price of wool and mutton. There is very little likelihood of any decrease in price, because of the great demand for wool and mutton and the destroying of all supply from the European market. For this reason we advise our readers to take up the breeding of sheep and we could suggest no better investment than buying a few of the animals offered by this firm.—Adv.

An Authority on Silage and Silos.

MODERN SILAGE METHODS" is a 264-page book that has been adopted as an authority on all silage and silo matters by many schools. A new edition, much better than all previous ones, containing a ten-page index, has been gotten out and will be sent for 10 cents in coin or stamps to anyone replying to the Silver Mfg. Co.'s advertisement on page 26. It tells all about silage feeding and silo construction. This company is widely and favorably known as the manufacturers of Silver's "Ohio" silo fillers. They will be glad to send you free on request their catalog and booklet "Silo Filler Logic." In writing them address Silver Mfg. Co., 312 Broadway, Salem, Ohio, and please refer to their advertisement in this paper.—Adv.

J. C. Hendricks' Big-Type Poland China Sale.

THE second sale in the Southern Wisconsin Poland China Sale Circuit is that of J. C. Hendricks, Hazel Green, Wis., Wednesday, February 9th. Mr. Hendricks' herd is well known to Poland China breeders throughout Wisconsin, Illinios, Minnesota and Iowa, because of the many good animals which have come from this herd. The noted boar, Hidestretcher, which won grand championship at the 1914 Wisconsin State Fair and others of equal note were bred on this farm. He has developed an exceptionally good "type" of big-type animals, not only breeding animals of great size, but with this combining good width, deep barrels and deep, thick hams. The offering of gilts and sows for his sale are very creditable. They have not been stinted on feed of the right sort and by steady growing from birth have developed into animals far above the average. On December 30th when issuing his catalogs for the sale, Mr. Hendricks weighed every animal going into the sale and has entered the weight of every sow and gilt in the catalog. Many of the gilts weighed close to 400 pounds at that time, while the average was close to 350 pounds. By date of sale the average will probably be close to 375 pounds. These animals represent the most popular of proven blood lines, being daughters and granddaughters of Fesenmeyer's famous boar, A Wonder; Peter Mouw's boar, Big Bone; the 1,000-pound boar, Big Bug; Wisconsin Giant; High Wonder, a 850-pound two-year-old and the 1,000-pound boar, Black Jumbo. These are out of large sows of good type, many of which weighed from 600 to 800 pounds. They are bred for spring litters to Mr. Hendricks' excellent boars, Repeater, Smooth Price, North Star Wonder and Oakland's Equal Jr. Catalogs containing pictures, pedigrees and description are now ready and will be sent on application. Send for one and look it over carefully. Plan to attend the sale in person. However, if impossible to attend the sale send a mail bid and a description of the type of animal you want to H. S. Hoard, representative of The Wisconsin Farmer. Mr. Hendricks states that all animals purchased on mail bids may be returned and the money will be refunded if not satisfactory. See page 37.—Adv.

Smiley's Annual Sow Sale.

WILLIAM SMILEY & SON, Albany, Wis., will hold their annual sale of bred sows and gilts on Tuesday, February 8, 1916. These sales are always looked forward to by Poland China breededs throughout this territory for the reputation of Smiley's Poland Chinas is of the best. Their winnings at the Wisconsin State Fair and leading county fairs throughout the state and the high quality of the animals, which they have sold both privately and in the sale ring have established this herd in the minds of

PONTIAC CORNUCOPIA CORONIS 51148, sire of the yearling Holstein bulls advertised for sale on page 39 by J. Roy Gordon, Mineral Point, Wis.

Poland China breeders everywhere. The offering which goes into their sale this year is of the same high quality that has won for them this enviable reputation. These animals are largely of their own breeding, many of them show animals themselves and practically all of them sired by their noted show boars and out of their show sows. They represent the very best in the line of breeding, being of blood lines that have proven to produce animals of the best type. The majority of the gilts in this sale are daughters of such boars as Major Hadley, Monarch, Wisconsin Jumbo 2d, Keefer's King and Orange Price. Major Hadley will be remembered as the senior boar of the Smiley herd. He is a big boar of excellent type and his offspring have been heavy winners in the show ring. He won first himself at the Wisconsin State Fair. Monarch won second as a senior yearling at the 1915 Wisconsin State Fair, weighing 800 pounds. Wisconsin Jumbo 2d is an excellent individual, sired by Peter Mouw's noted boar, Longfellow Jr., and out of the sow, Miss Mouw, an 800-pound daughter of Big Jumbo. Keefer's King is a son of Pfander's noted boar, King of Wonders. Orange Price is a son of Miller's Chief Price and out of a daughter of Miller's Big Orange. It will be seen that these

Sale starts at 2 o'clock. Will be held three blocks from C., M. & St. P. and C. & N. W. Railway stations. No driving and no delay necessary and perfectly comfortable, regardless of the weather.

SOME OF THE GILTS IN THE SALE

50 Head Bred Duroc Sows, 18 Tried Sows, 32 Spring Gilts **50**

Ten by King the Colonel, the sire of more 1,000-pound boars and top-price gilts than any other boar of the breed. **Eight by a son of King the Colonel. Two by Lee's Defender,** grand champion at the 1914 Wisconsin State Fair. **Fifteen of Golden Model breeding. Seven of Defender breeding.**

How Do These Proven Blood Lines Look to You?

In addition to being well bred and good individuals these sows are safe in pig to our great herd boars, **Lincoln's Model,** first and champion at six leading fairs; S. and H. Colonel, out of a daughter of King the Colonel; **Logan Col.,** a son of King the Colonel; **Salem's Model,** of Golden Model breeding.

Attend this sale and be prepared to supply the great demand for breeding stock next fall. Trains leaving Watertown, Portage, Madison, Wis., Monday forenoon arrive here in ample time for sale. Be with us.

STUBBS & HYZER, West Salem, Wis.

gilts represent the best blood lines of the breed. Catalogs are now ready, which contains pictures, description and pedigrees. We urge our readers to attend this sale and the other sales of the Southern Wisconsin Poland China Sale Circuit. Send for catalog at once and look it over carefully. If impossible to attend the sale in person send a mail bid to the auctioneer, Ira Cottingham or H. S. Hoard. See page 37. —Adv.

A Story of Unbroken Successes.

THE history of "P. & O." Little Genius engine gang plows is a story of unbroken successes. Wherever they have been used they have called forth words of highest praise for their strength, ease in handling and durability. They are made with molds or disks of various styles for from two to twelve farrows. One of the most popular is their "No. 2. Little Genius" with a powerful and

BIG-TYPE Poland China gilts going into the sale of Wm. Smiley & Son, Albany, Wis., February 8th. See advertisement on page 37.

positive rear wheel lift, shown in their advertisement on page 18. It has a hitch adapted to all tractors and one man operates both engine and plow. The power lift operates all three wheels, giving a high, level lift. You can get further information about them from your dealer or by writing Parlin & Orendorff Co., Canton, Ill., and mentioning this paper.—Adv.

National Incubators Guaranteed Twelve Years.

NATIONAL incubators are made with hot water heat, double walls with dead air spaces, asbestos lining and metal covers. They are self regulating and it is claimed they will not warp or shrink. They get big hatches in the coldest weather and are shipped set up with a book of operating instructions. In their advertisement on page 23, the National Incubator Co. is offering to

TOO LATE TO CLASSIFY.

OF serviceable age and younger; and yearling heifers and younger; from heavy-producing cows of A. R. breeding.

H. A. MARTIN - . GOTHAM, WIS.

send its 165-egg incubators and brooders for $10 on forty days' trial with money back proposition and twelve years' guarantee. They prepay the freight east of the Rockies. For further facts address National Incubator Co., Box 62, Racine, Wis., and kindly refer to this paper.—Adv.

Bargains From Earl Ferris Nursery Company.

THE Earl Ferris Nursery, of Hampton, Iowa, has established a big reputation for their evergreens, and when they say that the trees they are offering in their advertisement on page 14 are the best they have ever grown it means something. They are offering to send 100 of these windbreak evergreens for $1.50, prepaid. Other bargains which they mention are apple trees for 10 cents each, with twenty-five standard varieties to pick from, 300 popular variety strawberry plants for $1.00 and a combination offer for 98 cents, sent prepaid by parcel post. Their free catalog is printed in colors and not only gives prices and descriptions, but contains valuable advice and suggestions for the planting and growing of fruits, vegetables and shrubbery. To get a copy address Earl Ferris Nursery Co., 265 Bridge St., Hampton, Iowa, and please mention this paper.—Adv.

Seed Catalog With 700 Pictures.

A BIG seed catalog, containing over 700 illustrations of vegetables and flowers, will be sent free to all of our readers replying to R. H. Shumway's advertisement on page 14. He will also send one to any of your neighbors whose names you will send him. With every order of seeds he sends a lot of new sorts free. If after testing his seeds they are not found O. K. you can return them and get your money back. Address R. H. Shumway, Rockford, Ill., and kindly mention this paper in writing.—Adv.

L. F. ATWATER'S GREAT DUROC

BRED SOW SALE

BANCOR, WIS., FEBRUARY 1, 1916

47 HEAD OF CHAMPIONSHIP CALIBER AND BREEDING

30 GILTS OUT OF BLUE RIBBON SOWS

These are sired by the great Lee's Defender, and their dams are the sows I won my ribbons on at the state fairs this last summer.

10 GILTS OUT OF LEE'S DEFENDER SOWS

Their sire is Select Advancer, he by Chief Select, a full brother to Cherry Chief. Here is breeding unexcelled anywhere.

5 GILTS BY CORRECTOR

He by Sensation Wonder and out of a Golden Model 2nd dam. These five are bred to Lee's Defender; they are sure grand champion stuff, as Lee's Defender and Corrector were twice awarded the purple ribbons.

2 GREAT FALL SOWS

Sired by Lee's Defender; their dam a full sister to the sow that won three grand championships at the big fairs in 1915. These two sows themselves were first and second and trophy winners at two of the big shows in 1915.

Remember, two-thirds of this offering bred to farrow in March. I. E. Stickelman, Auctioneer. H. S. Hoard, Wisconsin Farmer field man. Send for my Catalog today.

IMPORTERS AND BREEDERS OF

PERCHERON, BELGIAN AND CLYDESDALE STALLIONS AND MARES

WE now have in our barns more big-boned, rugged draft colts, from yearlings to 4 and 5 years, of the different breeds than ever before. We have two-year-olds that weigh over a ton—herd headers and show propositions.

Five farms over 1,000 acres devoted to the horse business. We do all our own buying and selling, grow all our own feed. Our economical way of handling stallions saves money for the purchaser. We guarantee all horses sold and can sell you a high-class stallion cheaper than any other firm in America.

We are located in North Central Iowa, 20 miles from the Minnesota line, on the C. M. & St. P. Ry., midway between Mason City and McGregor.

Send 20c in stamps for large Horse Hanger which shows our Main Farm and sales stables. Correspondence a pleasure. **We have a horse for every purse.**

Smiley's Annual Big-Type Poland China Bred Sow Sale

Albany, Wis., Tuesday, February 8, 1916

The Type of Gilts in the Sale

45 SPRING GILTS; six fall yearling and mature sows. These are sired by Major Hadley, our noted sire of prize winners; Wisconsin Jumbo 2d, a son of the $1,500 boar, Longfellow Jr.; Monarch, weighed 800 pounds and won second at 1915 Wisconsin State Fair; Keefer's King, a grandson of old A Wonder; Orange Price by Miller's Big Orange. These are bred to Major Hadley, Wisconsin Jumbo 2d, Monarch, also Major Miller, first-prize yearling at 1915 Wisconsin State Fair; Big Hadley (by Big Top), Mouw's Wonder and Big Bone Jumbo. These are of good size and quality. The type that have won us so many blue ribbons at the state fair. Send for catalog containing eight illustrations, descriptions and pedigrees. Train service has been arranged to get to J. C. Hendricks' sale the day following at Hazel Green.

Black Jumbo 221231

The Greatest 1,100 Pound Boar in America

Sale February 10, 1916

40 HEAD of sows and gilts, mostly bred to or sired by Black Jumbo. Nine corking good fall yearlings that are good enough to enter the best herds in the corn belt; four tried sows, twenty-seven spring gilts weighing up to 400 pounds and better. The offering is sired by Black Jumbo, King Jumbo, Oakland's Equal, Peerless Wonder, Giant Big Bug and Great Leader; bred to Black Jumbo, Big Oakland, Long Joe and R.'s Wonder for March and April farrow. Size, bone and quality combined. Col. Ira Cottingham, auctioneer. Write for catalog. Address

E. W. Hendricks, Hazel Green, Wis.

J. C. Hendricks' Big Sale

HAZEL GREEN, WIS., WEDNESDAY, FEB. 9, 1916

BIG type, big bone, big litters, big quality. Forty head of great sows and gilts that for size, length, bone, quality and feeding propensity will please the most fastidious buyers. Five tried sows, all having raised fall litters, sired by A Wonder, Wisconsin Giant, Big Bone, Big Bug and Big Leader. Thirty-five spring gilts, mostly March farrow, sired by Repeater, High Wonder, Black Jumbo, Smooth Wonder, Giant Defender and H.'s Jumbo, and are bred to Repeater, the greatest two-year-old boar living, weighing 810 pounds after service; High Wonder by Long Wonder 2d, the $600 boar. He sired first and second-prize under six months gilt in futurity class and second on produce of sow at Milwaukee this last fall. Others will be bred to Smooth Price, the largest and heaviest boned boar in the state. Weighed 550 pounds at twelve months and has a ten-inch bone, and North Side Wonder, a big, rugged, extra heavy-boned boar by Rude's Wonder by A Wonder, dam Orange Gem by Big Orange. He is a 1,000-pound boar at maturity. These gilts were all weighed on December 30th. They range in weight from 300 to 390 pounds in growing condition. They must be seen to be appreciated. Big Daisy has five dandy gilts, March 5th farrow; average weight on December 30th, 345 pounds; sired by Smooth Wonder. Wis. Giantess has five gilts, farrowed March 12th; average weight December 30th, 335 pounds; sired by High Wonder. Mary Miller has four gilts, average 325 pounds, and others are just as good. These are only a few samples. Send for catalog, which gives weight of each sow and gilt. It is instructive. Auctioneer, Col. Ira Cottingham. H. S. Hoard will represent The Wisconsin Farmer. Send your bids to him and I will guarantee entire satisfaction.

J. C. HENDRICKS HAZEL GREEN, WISCONSIN

Madson's Big Poland China Sale

Friday, February 11, 1916, Madison, Wis.

(Wisconsin Poland China Breeders' Annual Meeting Held Friday Evening)

30 Spring Gilts, 10 Yearling and Mature Sows

Cholera Immune Cholera Immune

Sale Held in Dr. West's Veterinary Barns

NO DRIVING in country necessary; 753 East Washington avenue. Building well heated and lighted. The spring gilts are sired by the big-type boar, **Corrector I Am, junior champion boar** at the Minnesota and Illinois State Fairs in 1914. He is by Correct I Know, grand champion South Dakota State Fair. The fall sows are by **Royal Model and Badger Perfection.** These gilts are bred to the big-type boar, **Triumph,** by **Hidestretcher,** grand champion at the 1914 Minnesota State Fair. These sows are big, well developed, combining quality with size. They will produce the profitable type of hogs and the type that will win in the show ring next fall. Send for catalog. Plan to attend this sale and the Wisconsin Poland China breeders' meeting in the evening.

Homestead Farm Guernseys

TEN bulls, grandsons of Governor of the Chien. From 1 to 15 months; mostly from A. R. O. cows with records up to 566 lbs. fat. Prices reasonable.

W. G. Jamison & Sons, Appleton, Wisconsin

JERSEY CATTLE.

More Butter and Better Butter

YOUR HERD should average at least 500 lbs. of butter per year. A good Jersey herd will do even better—600 lbs. per year, and the butter will be of the finest flavor, texture, and color. There are many individuals of this breed producing 1100 lbs. They make good use of every ounce of feed, do not require fancy feeding, mature early, thrive in any climate, are steady producers, are beautiful and gentle. They pay big dividends on the highest priced land.

Our latest free book, "About Jersey Cattle," tells all about the development of this hardy breed. Send for it—*now*. You'll be glad you did.

American Jersey Cattle Club
338 West 23rd St., New York City

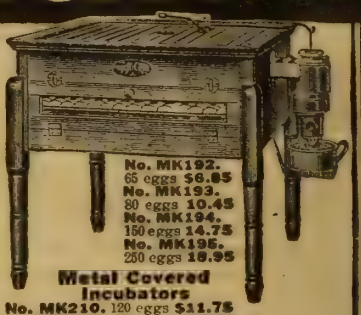
HARTMAN'S SPECIAL Farm Credit Plan

HARTMAN'S Sensational Bargains

Look at the bargains on this page. Every one is a big money saver. You couldn't begin to buy elsewhere, paint and roofing, or engine, an incubator, brooder or cream separator of the Hartman high quality at anywhere near the terms we ask, even were you to pay all cash. On the Hartman Plan you can test the quality of your purchase before you decide to buy and, if goods are satisfactory, practically your own time to pay.

Order Direct From This Page Send no money—not a cent in advance. Hartman will ship the goods promptly—no deposit required—no C. O. D.—no tiresome "red tape"—no security—no interest to pay. We give you free, wide-open credit in the literal meaning of the word. Everything is strictly confidential. You run absolutely no risk.



CREAM SEPARATOR

Lowest price ever made on a strictly high grade Separator. Learn from your own experience that here, at last, in the Majestic is a perfect separator—a masterpiece of mechanical skill and ingenuity. Test it on warm or cold milk and find out by actual results how the Majestic skims down to the last drop—note the condition of cream—note how quickly it skims.

The Majestic Cream Separator has all the latest improvements including remarkable inside oiling device that keeps gearing perfectly lubricated and absolutely prevents a drop of oil coming in contact with cream. Improved separable disc bowl. Simplest to clean—all parts readily accessible—no nooks or corners to gather dirt.

Order Direct From This Advertisement. Just state size you want. We will ship it promptly. If not satisfactory after 30 days trial, return at our freight expense both ways. If you decide to keep it, make first small payment in three months; balance in 3, 6 and 9 months thereafter. No interest to pay.

FREE SEPARATOR BOOK. Fully describes the remarkable Majestic and proves its great value. Mail Coupon today.

No Money In Advance

ROOFING

Hercules Never-Leak, Flint-Surfaced Roofing Is Absolutely Guaranteed "All-Kinds-of-Weather-Proof"—Greatest Money-Saving Roofing Offer Ever Made.

Order all the roofing you need direct from this advertisement. You run no risk because you are not required to send a cent with your order, make a deposit with anyone or even promise to buy.

Why have a leaky roof on any building when you can buy **absolutely guaranteed** roofing at such low prices and on such unheard of liberal terms?

No matter where you live, you will find that Hercules Roofing will remain unchanged and unharmed under all climatic conditions.

Made from highest quality long fibre wool felt, thoroughly saturated with pure asphalt. Both sides are thickly coated with very fine sharp particles of crystal which are firmly imbedded under enormous pressure.

Each roll is complete—32 in. wide, contains 108 sq. ft. (enough to cover 100 sq. ft.) Nails and cement included. No skill required to lay.

No. MK207. 1-ply, 55 lbs. per roll, guaranteed 5 years, per roll..... **$1.29**
No. MK208. 2-ply, 65 lbs. per roll, guaranteed 8 years, per roll..... **$1.78**
No. MK209. 3-ply, 75 lbs. per roll, guaranteed 12 years, per roll..... **$2.23**

Free Samples Your name and address on the coupon below or on a postal card will bring them by return mail.

We realize that farm dwellers everywhere prefer to pay their obligations at crop and stock selling times. It is more convenient for them to do so. We have devised our credit terms accordingly—to suit your convenience. And it is the most liberal credit ever offered by any concern.

Pay In 3, 6, 9 and 12 Months

Not only will we send you anything you want for farm or home—engine, separator, paint, roofing, incubator, brooder, furniture, rugs, carpets, stoves, ranges, dishes, silverware, etc., **without a cent of advance payment,** but you have 30 days' free use of the goods before you even decide to keep them. If you decide **not** to keep them, return them at our freight expense both ways. If you keep what you order, **you can take 3 whole months** before making even the first small payment—balance **in 3, 6 and 9 months** thereafter, giving you **a full year** to pay **without a cent of interest.** No other concern in the world has such confidence in the quality of its merchandise as to send out goods on such wide open terms as these. With $12,000,000 capital and resources, 1,500,000 satisfied customers and an organization that has grown for over 60 years to its present gigantic proportions Hartman's can well afford to accommodate the farm dwellers of this country.

PAINT

Rex-Kote Paint Is Guaranteed

Made of the best and purest ingredients. Guaranteed against peeling, blistering, chalking or rubbing off, and to cover more surface, make a better finish, and last longer than any other paint. Mixed by machinery—pigments and oil ground together until every particle is thoroughly impregnated with and absorbed by the others. This insures greater spreading qualities and more uniform color.

Don't confuse this paint with cheap paints you see advertised, and don't let a painter tell you that any paint mixed by hand is better, or even as good as our Rex-Kote Ready-Mixed House Paint. It is not. It can't be.

Send no money. Order all the paint you want direct from this advertisement. Your credit is good. Not a cent to pay for three months. You can pay in 3, 6, 9 and 12 months.

No. MK159. Ready Mixed House Paint as low per gallon as **$1.27**
No. MK160. Ready Mixed Mineral Barn Paint as low per gal. as **94c**
No. MK161. Ready Mixed Roof Paint as low per gallon as **59c**

GASOLINE ENGINES

Here is the engine offer that eclipses all others. Think of it—not one cent to pay for three months.

Don't send us a cent of your money until, from your own experience on your own work, you are absolutely sure it is the engine you want. If it isn't, send it back at our expense. If it is, you may use it for three whole months before you make even the first small payment and then pay the balance in 3, 6 and 9 months thereafter without interest.

The Great Majestic Gasoline, Kerosene, Naphtha and Gas Engines

are such amazing triumphs of engine construction that we will gladly send any size to suit your needs so that you, by testing it on your own place, may prove our claims at our risk.

The Majestic is the "happy medium"—neither too heavy or too light. Has fewer number of parts—a marvel of simplicity. Perfectly balanced—no excessive friction—most powerful for its H. P. rating, the most economical to operate.

Big improvements in all vital parts—and the most wonderful automatic mixer ever put on a gasoline engine.

Horizontal, 4-cycle type, open jacket, hopper cooled. No over-heating of parts or sticking of valves. Very little water needed for cooling.

Sizes 2, 3, 5, 7, 9 and 14 H. P. Stationary, Hand Portable and Horse Portable Styles.

FREE Engine Book

Tells why the majestic is the biggest engine value in America today and explains the famous Hartman selling plan.

The Wisconsin Farmer

THURSDAY, FEBRUARY 3, 1916.

FAMILY CIRCLE TALKS
BY THE PUBLISHER

THE PRESIDENT'S VISIT.

BY THE time these words of mine are read the president will well-nigh have completed his swing around the circle in the grain belt. His intention to visit us may possibly not have been arrived at suddenly, but it was announced with little public preparation. He has been rather thorough in his evident desire to reach every section of the grain belt, his tour including stops and speeches in Milwaukee, Chicago, Des Moines, Topeka, Kansas City, St. Louis and innumerable smaller towns en route, where farmers will no doubt compose a goodly part of his audiences.

It is quite noteworthy, to me at least, that in his very first appeal to the people on any big, notable and national issue, the president has chosen to come to the grain belt first; to the cities which, despite their large factories and stores, are rural rather than urban in sentiment and composition. Milwaukee, Chicago, Kansas City and the other cities visited number their inhabitants by the hundreds of thousands; they are cities, in every sense of the word. But they are cities made up of folks from the farm and small town, in which the finger of the analyst can feel the throb of country life, as it is utterly impossible to feel it in New York, Philadelphia and the other big cities of the East. The president is wise enough to propose to stop at innumerable small towns, where he will get in close touch with the farmers and the actual rural population, but he is not out of touch with that population when he visits the large cities of the grain belt, recruited from the ranks of the farm and the small towns of less than 5,000 inhabitants. In coming thus among us he makes public testimony to the fact that public sentiment is best manifest here, amid people whose tastes and tendencies are rural, rather than urban. The president could have reached more people, numerically speaking, within a few hundred miles of Washington. He could not have reached so many typical Americans, whose opinions so really reflect and crystallize national ideas and ideals, other than by coming here to the grain belt. It is a compliment which we acknowledge with modesty, admitting it to be well deserved.

I have no doubt but that the president will devote most of his time and energies to defending national preparedness and to sounding public views on this subject. As host to our chief executive it would be discourteous for us to deny him the first word or an uninterrupted opportunity to have his say. Because we are silent when he urges us to turn our cornfields into munition factories and beat our pruning hooks into swords is not to say we agree with him; because we greet him with an enthusiasm which approaches the demonstrative is not to say we are ready for the new policy of empire which he would thrust upon us. There is a certain patriotic homage due the high office he occupies, an acknowledged appreciation of the many high qualities of head and heart which he brings to this office. So, as hosts, we welcome, applaud and entertain our guest, not promising, however, that as soon as the obligations of hospitality are at an end we shall not speak out in meeting and make our real sentiments manifest in most positive and unmistakable terms.

My own views on the issue which the president comes among us to champion are already well known. With our nation's chief executive honoring us with his presence this week I shall not have the effrontery to advance views which cannot but be antagonistic to those of our distinguished guest. Later on, as we counsel together, I shall speak, frequently and freely. Now, with the president swinging around the circle in the fertile garden spot of the world, our duty is to honor the man for doing what he conscientiously believes to be right. He has the courage of his convictions and is certain to express those convictions in language which all can understand, forcible and elegant. One and all, we should unite in welcoming him to the grain belt, to which he comes in the full knowledge that it is this section which he must win if the idea he champions is to be adopted by the nation.

TARIFF COMMISSION SUCCESS.

I AM delighted to see by the newspaper dispatches this week that President Wilson has committed himself in favor of a non-partisan tariff commission, which shall investigate and recommend with an eye single to the needs of the country as a whole and its best development. With the president thus squarely aligned in favor of the plan, I can see no reason why it should not be pushed through congress this winter, without undue delay.

I am greatly interested in this proposed non-partisan tariff commission for several reasons. First, because we must all admit we have been bungling our tariff revisions, upward and downward, for a good many years, considering the welfare of sections, instead of the country as a whole, and allowing certain interests to become all too firmly entrenched behind barriers of special privileges, when so important a matter should be settled for the greatest good of the greatest number. Second, because the bill which is to be introduced in congress gives agriculture representation upon the commission, its authors acknowledging it to be the most important industry in our country, demanding representation above all others. Third, because the plan is being pushed through to success by a personal friend, a man of unwavering determination, to whom every farmer owes a vote of thanks for being the man to put the Smith-Lever bill through congress, bringing our agricultural colleges home to us on the farms, making our educational system practical and of direct value to every member of the farm household.

I am delighted to see that success is about to crown the efforts of this man, who has devoted the major part of his time for the last half year to urging such a non-partisan tariff commission upon everyone within sound of his voice. Those of my readers who attended the sessions of the Farmers' National Congress at Omaha last fall heard Mr. H. H. Gross explain his plan in detail. It is this same plan which the president is now said to indorse and which, with the strong backing Mr. Gross has secured for it from all lines of industry, bids fair to be adopted by congress and to give the country long-needed relief from tariff tinkering, which, as I said before, is all too often tariff bungling.

I have devoted several columns of this department to indorsing this non-partisan tariff commission plan, and Mr. Gross was kind enough, a few weeks ago, to write and say I had rendered him invaluable assistance and that as a result of my articles he had received innumerable letters of commendation and support from farmers all over the country. I am glad, indeed, if I have been of any service and I shall look forward to seeing the efforts of Mr. Gross and his associates crowned with the success which they richly deserve. Mr. Gross has addressed innumerable gatherings during the last six months, always insisting (sometimes in the face of strenuous opposition) that agriculture shall have representation upon the commission, being too large and important an industry to ignore or overlook. In this he is absolutely right and I hasten to congratulate him upon his determined stand. Many men have argued with him, but in the end they have been convinced that he was right and so a great victory has been won.

Our nation confronts a period of even greater prosperity than it is now enjoying. To reap the full benefits of this larger prosperity, however, we must solve our problems in a big, national way, putting general welfare above individual good, making the nation the unit of our interests and endeavors. We will have taken a long step toward clearing the political atmosphere and putting government on a higher plane if we succeed, as now seems almost certain, in removing the tariff from politics and placing it in the hands of a non-partisan commission, the very first member of which shall represent the great farming interests of our country.

A MODEL FARM LEASE.

A SUBSCRIBER sends me a copy of a five-year farm lease recently signed by friends of his, a model of its kind and so interesting it opens up a most profitable subject for discussion in this page of mine. Before I give you the terms of this particular lease I want to tell of two other incidents which have recently come under my observation.

I have the honor to number among my friends a young banker who inherited 480 acres of grain-belt land, which he has tiled, fertilized and otherwise reclaimed until he has increased the gross rental from $2 to $10 and (in particularly favorable years) even to $12 an acre. He does not work this land himself, but leases it, his holdings comprising about 1,300 acres altogether. Under the terms of his leases the owner receives one-half of the corn, two-fifths of the small grain and $5 an acre for the hay and pasture land. My friend is a firm believer in commercial fertilizers, which he furnishes to his tenants in carload lots, they being required to haul it from the near-by town and spread it over the fields, but not being called upon to bear any of the expense. By reason of the tiling and the continued use of fertilizers the landlord has been able to increase his gross profits from 4 per cent to 14 per cent a year. But the tenants fared still better, for while he was doing this they increased their net earnings 24 per cent in one case and 47 per cent in another case. My banker friend advises me that practically all his tenants (there have been perhaps twenty or thirty in the last ten years) remain on his farm about three years, on the average, and then get places of their own, using as their original cash payment the money they have made and saved while tenant farmers. Here is splendid proof that the door of opportunity is open to both landowner and tenant when they work together harmoniously, realizing that their interests are mutual.

I had the pleasure, last summer, to hear a most practical talk given before a national conference of farm workers by a southern woman, Mrs. G. H. Mathis, of Alabama. Here, in briefest outline, is her story:

She bought 1,000 acres of farm land and decided to try out her tenant-farming plans. She tore up all the existing leases and made out new ones. Her first lease, and every one since, called for so many acres in corn, so many in hay, so many in potatoes; one acre in sorghum, from which to make at least one barrel of molasses for the tenant's own use; at least two acres of garden truck and other "surplus money" crops; one brood sow, that will yield $100 worth of meat; one cow and calf, that will yield $50 worth of butter, milk and meat; one brood mare, that will raise a colt worth $100; in addition to all which the lease provided for keeping roads and fences in repair and for removing all filth promptly, "so as to protect the health of my own family and the water supply of other people," all this work to be done under the direction of Mrs. Mathis, "without dissension or fuss"—the exact words.

The underlying idea is not hard to find. First, Mrs. Mathis wanted to see that her tenants raise enough to feed themselves, their families and their live stock. Then she wanted to insure a diversity of crops that would bring in ready money all the year around and get the shiftless ones away from cotton and nothing but cotton. By this method she has succeeded in bettering the lot of her tenants until now many own their places or are buying them on the installment plan, while she has materially reduced the 45 per cent which formerly had absolutely nothing, neither hog, horse nor cow, moving every twelve months. Another case, you see, of partnership between landowner and tenant and not making the transaction a mere matter of dollars and cents alone.

Now, I want to tell you of the model lease which my subscriber friend sends to me. It covers five years and provides for the owner furnishing the land and one-half of all the stock and machinery necessary to work it; the tenant furnishing all the labor and the other half of the stock and machinery. Permanent improvements are to be made from time to time, on the agreement of both owner and tenant, provision being made for borrowing money for this purpose, when both agree to it, the taxes, insurance and mortgage interest to be included in the expenses which are to be deducted before there is any division of profit. The crops and produce are to be sold and divided evenly, and at the end of the lease period of five years whatever sum the land may be worth in excess of $135 an acre, agreed upon as the present value, shall be divided evenly between owner and tenant. If they cannot agree on the valuation when the lease expires a third party, to be agreed upon, is to appraise it. Should the owner not accept this appraisement and agree to pay the tenant one-half of the increase in the land value, the farm is to be sold, the tenant having the first option on it at the price the appraisers shall put upon it.

It seems to me this is an admirable, even ideal arrangement, worthy of being copied by others (owners and tenants alike) who conscientiously want to improve one another's condition and put tenant farming on a higher plane. If any of my readers know of similar cases they will do me a great favor by letting me hear of them. Here is a matter we can well afford to spend a few hours discussing between ourselves, now that the time of the year is here when farm leases are to be made out or renewed and the subject becomes one of major importance.

James M. Pierce

THE WISCONSIN FARMER

A WEEKLY JOURNAL OF AGRICULTURE, HORTICULTURE, STOCK RAISING AND ALLIED INDUSTRIES

BY JAMES M. PIERCE

JAMES ATKINSON, Editor-In-Chief

ESTABLISHED IN 1848

Entered at Des Moines Postoffice as second-class matter

PUBLISHED EVERY THURSDAY

1912 Grand Ave. Des Moines, Ia. | 201 Washington Bldg. Madison, Wis.

To either of which communications relating to subscription or advertising may be addressed.

MEMBER AGRICULTURAL PUBLISHERS' ASSOCIATION
MEMBER AUDIT BUREAU OF CIRCULATIONS

SUBSCRIPTION RATES—Single subscriptions, $1.00 a year. In clubs of ten, 75 cents a year and an extra copy to getter up of club. In clubs of fifty or more, 25 cents a year. Single subscription three years in advance, $1.50; five years in advance, $2.25; ten years in advance, $4.00. Subscription prices in Canada, $1.50 a year. Remit by draft, registered letter, postoffice or express money order. In changing address, send both the old and new addresses. In renewing, give the same name and initials as you gave before or state both the old and new names, and explain why you make the change. In case of errors or failure to receive the paper within two weeks, promptly notify the publisher. Address WISCONSIN FARMER, MADISON, WISCONSIN

Record-Breaking Issue of The Wisconsin Farmer.

THIS is the largest Wisconsin Farmer ever published. With forty-eight pages this number is eight pages larger than any previous issue of this paper. Files in our office show that this is the largest issue of a Wiconsin farm paper, from the standpoint of number of pages, in the years 1913, 1914, 1915 and 1916, and we believe it is the largest regular issue of a Wisconsin farm paper ever published.

This issue carries approximately ninety columns of advertising, which breaks all records for big issues in the years named. This paper is not only a splendid fulfillment of the hopes and aspirations of the publisher to lead as a Wisconsin farm paper, but it is prophetic of what may be expected in a much larger way in the future. The success of The Wisconsin Farmer is due entirely to the editorial efficiency of the paper. The foundation of any farm paper is what it has to give its patrons in the way of practical and interesting information concerning farm affairs in the field which it covers. The Wisconsin Farmer is edited and published for Wisconsin farmers, and its success as noted herein, is sufficient evidence of the approval of our readers.

One of the most gratifying phases of the farm paper situation in this state, to us, is the predominance which The Wisconsin Farmer maintains as an advertising medium for our prosperous stockmen. In the issue of January 20th The Wisconsin Farmer published seventeen and one-fourth columns of live stock advertising as compared to nine and one-half columns published by our nearest Wisconsin farm paper competitor. In this same issue The Wisconsin Farmer published a total of sixty-five columns of advertising, which was a gain of ten columns over last year. Our chief competitor published less total advertising in the issue of January 20th, and gained only one and one-fourth columns over the previous year. In the issue of January 27th The Wisconsin Farmer published seventeen and one-half columns of live stock advertising, and our next competitor only nine columns. This gave The Wisconsin Farmer a little more than two full pages the best of it, and indicates conclusively that the stockmen of this state regard the columns of The Wisconsin Farmer as their best market place. On total advertising in the issue of January 27th, The Wisconsin Farmer gained nineteen and one-half columns over last year, and the nearest competing paper gained fifteen and three-fourths columns.

The Wisconsin Farmer is attuned to the onward step of progress in the agricultural activities of this great state and feels closely the pulse of the farmers and stockmen on all practical topics and public issues. The Wisconsin Farmer has no political cliques to serve, is not affiliated with any "close corporation" organizations, and owes its one chief obligation to the farmers and live stock men who so liberally support it. The Wisconsin Farmer guarantees 80,000 circulation, which is a larger guaranteed circulation than is offered by any other Wisconsin farm paper. As a matter of fact The Wisconsin Farmer's actual circulation is largely in excess of its guaranteed amount, running well over 90,000 each week, over 75 per cent of which is concentrated in Wisconsin.

As we have started the year 1916 by making new records, we hope to continue it. More columns of good reading matter every week, more illustrations, more letters from Wisconsin people, greater interest in Wisconsin farm affairs, and more careful attention to the farm field of this state have made it possible to have this record-breaking issue of The Wisconsin Farmer. As the same policy is to be pursued and as we are prepared to redouble our efforts in these matters, we can see the brightest kind of a future for The Wisconsin Farmer.

For the hundreds of expressions of good will and encouragement received by the publisher through the mails, we take this opportunity to express our hearty thanks. Wisconsin farm and live stock opportunities are just opening up for development. This state can produce double the amount of almost any farm commodity we could name, if farming is properly carried on, with a minimum of waste and with proper equipment. To inspire the farmers in raising better products, to interest them in greater quantity of products, to aid them in living more comfortably and more happily, and to help work out their problems of sales and distribution, are some of the aims which the publisher and editors of this paper have in mind for the future. We ask the farmers of the state to continue to help us in this great work.

Wisconsin Man's New Ideas on Tuberculin Test.

COMMISSIONER OF AGRICULTURE C. P. NORGORD discussed the tuberculin test at the Waukesha County Guernsey Breeders' meeting and gave some new ideas which bid fair to assume national prominence.

Under the plan proposed by Commissioner Norgord tuberculin-tested cattle will not only be given a rating above those not tested, but this rating will be interstate and will be maintained and backed by veterinary departments of all states. The plan already has been indorsed by a number of states.

The plan presented by the commissioner practically is assured of general adoption, and already it has the indorsement of the executive committee of the Wisconsin Live Stock Breeders' Association, and will be formally indorsed by this organization at its annual meeting on February 10th. It also has been approved by several county breeders' associations.

The project has been worked out by the Wisconsin commissioner, the veterinary division of his department, of which Dr. O. H. Eliason is head, and the Live Stock Sanitary Board of the same department.

A campaign of education will be conducted in furtherance of the plan, and co-operating with the Wisconsin Department of Agriculture in this will be the College of Agriculture of University of Wisconsin, the United States Department of Agriculture, and the Wisconsin Live Stock Breeders' Association and all county breeders' organizations of Wisconsin.

The proposal of the commissioner means, in a word, that the tuberculin test will be so made use of, that, instead of its use being a stigma, added commercial importance will give the test the standing it deserves and make desirable its use.

Under the new order of things the herds coming under the test and found free from tuberculosis will be certified as Class A herds, and will be so listed in all states. Therefore, it will be an inducement for the breeder to voluntarily acquire this certification as soon as possible.

Death of James Zuill McLay.

JAMES ZUILL McLAY, prominent breeder and importer of Clydesdale horses and Short-horn cattle, died January 25th, at his home near Janesville, Rock county, aged fifty-three years. He had been ill of pneumonia, but was believed to be on the road to recovery when a sudden change for the worse came. Half an hour before his death Mr. McLay was pronounced much better, and his demise under such circumstances was a sudden shock.

With his brother, David McLay, James Z. McLay helped to collect what many good judges have called one of the finest groups of blooded Clydesdale horses in this country. The McLays have had and still maintain an exceptionally high standing among horsemen of this country and Canada. On their farms, aggregating about 900 acres in Rock county, they had thousands of dollars invested in blooded mares and stallions and Short-horn cattle. In 1904, at the World's Fair at St. Louis, the McLay farm swept the field with its exhibit of Clydesdales. At other state fairs during the past number of years the McLay horses have without fail always taken first honors.

Dr. A. S. Alexander, of the Wisconsin College of Agriculture, has written the following beautiful and richly merited appreciation of the late Mr. McLay:

James Zuill McLay exemplified the highest type of Christian country gentleman. At "Arngibbon," among his broad acres on Rock Prairie, near Janesville, he lived a retiring, peaceful, pastoral life, happy with his gudewife and large family, setting his children an ideal example and demonstrating the best methods of farming and stock breeding. He was modest, unassuming, courteous and conservative. He possessed the caution, reserve, thrift, keenness and integrity of his fine Scottish ancestry, like them was a stanch Presbyterian and he lived up to his creed and training. To the public he was best known and will longest be remembered as a successful breeder and judge of Clydesdale horses, but he also maintained a herd of pedigreed Short-horns. He was a constructive breeder keeping ever and clearly in mind an ideal of type and character which to him spelled perfection. It was based upon that of Cedric, Colonel Holloway's noted Prince of Wales horse, and its chief features were quality, style and action, oblique pasterns, silky "feather" and "cleftiness" of bone. Such refinement often is attained at a sacrifice of size and weight, yet many of the McLay bred Clydesdales, notably the females, have combined quality and size and everywhere ... animals of the stud have won a full shar... ...nors.

The "laird of Arngibbon" has ... from us in the prime of life, before h... ...pleted his work, before he could be spar... ...ered to his flock, but the Divine Will ... ...t and we must bow to it, keep "Jim" in affe... ...e memory and rest assured that he has de...rve... ...d received the "well done good and ... ..." of the Master.

A conspicuous ... which the late Mr. McLay took inter... ... the organization of the county Y. M. C. A. ... gives the rural boys the same privileges ... who belong to the Y. M. C. A. in town. Th... ...ork has been carried on in Rock county to the extent that inquiries concerning it have come from all over the country.

Mr. McLay was born in Rock county May 1, 1863, being the son of John and Jane Zuill McLay, who settled in Rock county in 1843. In 1888, on the third day of October he was united in marriage to Jean McFarland, the daughter of James McFarland. He is survived by the widow, three daughters, Mary McLay, who resides at home; Margaret McLay, a student at Beloit college; and Catherine McLay, who attends Monmouth College at Monmouth, Ill.; two sons, John McLay, of Milton College, and James Gordon McLay, at home. He is also survived by a sister, Mrs. Archie Reid, of this city, and two brothers, David McClay, of Johnstown, and William McLay, of this city.

The Wisconsin Farmer extends sympathy to the bereaved family. Mr. McLay's death is a loss to the state and nation.

Poultry Raising a Growing Industry.

IT IS DIFFICULT to comprehend the enormous total represented in the value of the poultry produced in the United States. It runs into the hundreds of millions, exceeding by far the enumeration given in the census reports. In 1911 the secretary of agriculture placed the total income from poultry and poultry products at $750,000,000. In our census reports no account is taken of the poultry raised and consumed in villages and towns, while the eggs and poultry consumed on the farm are also left out of the reckoning. The income from poultry alone is greater than that from the gold, silver, iron and coal mines in a given year, and until the last year or two the value of poultry products exceeded the value of the wheat crop.

No excuse, therefore, need be offered by The Wisconsin Farmer when it makes a special recognition of the great poultry industry by devoting a large part of this issue to poultry topics. From the year 1900 to 1910 the number of poultry in the United States increased 20 per cent, and there are those who are predicting that the next federal census will show an income from poultry products of the farms of the United States approximating $1,000,000,000.

Those who have been asked to contribute to this issue of The Wisconsin Farmer were warned in advance that readers of this paper were interested in poultry merely as a secondary farm industry. Exclusive poultry farms are so few in number that their needs are not to be considered at a time like this. There has been strict compliance with our suggestion and, therefore, the articles that appear in this issue will appeal strongly to those of our readers who are aware that their methods of poultry raising might be improved upon and who, therefore, turn the pages of The Wisconsin Farmer as open-minded truth seekers.

Poultry raising may be regarded as one branch of the farm that brings in a continuous revenue. It meets the little emergencies of life and, indeed, it supplies many of the comforts and most of the luxuries of living in thousands and tens of thousands of families.

While there are those who claim that there is little profit in the raising of poultry if the science of mathematics is coldly applied to the proposition, yet we contend that in no other industry is there so large a margin of profit returned from material that would otherwise go to waste as is the case with those who engage in poultry raising as a side issue to general stock and grain farming. On our high-priced land we must more and more realize on materials that have been going to waste in the past, and if we do this most efficiently we will be forced to recognize the numerous advantages of the poultry industry in attaining this end.

If profits are to increase these can come only as the result of more intelligent management. The day has passed when any breeder can afford to lose hundreds of little chicks simply as the result of irrational methods of feeding. Those who undertake to operate incubators should have it forced upon their attention that these artificial hens are highly efficient when properly managed. They have long since passed the experimental stage and, unquestionably, the introduction of incubators has been the one important factor responsible for the great increase in the number of poultry on the farms of the United States during the last decade and a half.

Those who have contributed to this issue of The Wisconsin Farmer are not in any sense theorists, but practical poultry people who bring to their subject not only comprehensive theoretical knowledge, but abundant practical experience. The reader may rely implicitly upon the instruction embodied in the various contributions, and we make the suggeston that this issue of The Wis-

consin Farmer be preserved so that some of the articles contained in it may be read and reread during the season when we are in the midst of active poultry raising operations.

Wisconsin Potato Men to Profit.

WISCONSIN growers are in a fair way to realize considerable profit on potato stock now on hand, even though the stock is much less in quantity than a year ago. On January 1, 1915, Wisconsin growers had 20,356,000 bushels of potatoes on hand. In addition to this there were 3,770,000 bushels in the hands of dealers. At that time, however, the price was around 30 cents. This was the prevailing price on December 1, 1914, and it fluctuated very little, being only 31 cents on March 1, 1915.

At the present time Wisconsin growers have nearly 12,000,000 bushels of potatoes on hand and dealers have 3,370,000 bushels. The price on December 1, 1915, was 45 cents, and it has advanced since then and there is every prospect of an advance before March 1st.

Unusually small stocks of potatoes were held on January 1st in the important potato-producing states, according to reports of correspondents of the Bureau of Crop Estimates. This is the reverse of conditions a year ago. Then, stocks were unusually large and southern potato growers who compete in the spring months with stocks carried over in the northern states were warned to expect the low prices which prevailed last spring.

Supplies on hand January 1, 1916, for market, are estimated to be about 38 per cent smaller than a year ago, 15 per cent smaller than two years ago, 30 per cent smaller than three years ago, but 16 per cent larger than four years ago.

If, for the purpose of comparison, the estimates of percentages of marketable stocks of potatoes on January 1st be applied to the estimates of total production, it shows, in the states included (which produced 66 per cent of the 1915 crop and 78 per cent of the 1914 crop of the United States), a total of 105,345,000 bushels January 1, 1916, compared with 169,554,000 a year ago, 123,292,000 two years ago, 149,845,000 three years ago and 90,778,000 four years ago. These figures indicate that southern growers need not fear a burdensome competition with northern stocks of potatoes this spring. The United States seldom imports or exports relatively a large quantity of potatoes. Therefore, the European war has no material direct influence upon the potato market of the United States.

Toting Water No Longer Necessary

THAT the farm housewife in her ordinary duties carries more than a ton of water a week, on a farm where there is no water system, is not generally known, but it is a fact. It is possible to relieve the women in farm homes from this drudgery with machinery which can be installed at a reasonable expense. "Toting" water requires a good deal of strength and time. It is easily possible for systems to be installed which will permit water supply for kitchen and other rooms of the home by simply turning on a faucet. Mr. F. M. White, secretary of the American Society of Agricultural Engineers, and a member of the Wisconsin College of Agriculture staff, has discussed the water-carrying problem in a Wisconsin Bankers' Farm Bulletin for February. The source of water supply on a farm is usually made convenient for the men, near the barn. A great many farmers object to pumping water for their stock and so have a gas engine or a windmill. Mr. White calls attention to the fact that it is usually possible to make this same engine or windmill furnish power for pumping every drop of water needed in the home. He says that installation of the motor system for the home is not so expensive as one may think. There are three methods of distribution: First, the elevated tank system; second, the air and water pressure system; third, the fresh water direct from the well. Before any of these are installed the source of supply should be considered, and in doing this Mr. White says that we may figure the following quantities of water needed daily: Twenty-five gallons per person, ten gallons per horse, ten gallons per cow, two gallons per hog, two gallons per sheep. Mr. White recommends wood as a good material for the tank, as wood will not sweat nor rust, causes little trouble to erect, is easier to keep from freezing and will last fifteen to twenty years. Where the tank is to be of large capacity he prefers steel or concrete. In Upper Wisconsin tanks will give trouble unless well protected. The tank must be at least six feet above point of delivery for every 100 feet of three-fourths-inch pipe through which water flows. The tank must be supported by heavy timbers. A good location for a gravity tank is in the hay-mow. A tank made of steel six feet in diameter and eight feet deep will hold 1,688 gallons, and will cost not to exceed $100 to install.

In the air and water, or hydro-pneumatic system, air and water are stored in an air-tight tank. The advantage is that this tank may be placed in the basement of the house or in the ground near the well. An outfit large enough for a family of six, for six horses, twenty head of cattle and ten hogs can be installed for $200. A small tank for house use only would cost about $100. The fresh water, or pneumatic system, delivers water direct from the well to the faucet, using compressed air as the power. This is a late development in water supply systems, according to Mr. White, and the special pump and air compressor and air tank complete cost about $300. The advantages of this system are as follows:

(1) One air storage tank will supply both hard and soft water by providing the extra cylinder or pump.
(2) Fresh water at all times.

Its disadvantages are:

(1) Storage of air difficult.
(2) Sand in water causes leaky valves.
(3) Not suitable to raise water over 125 feet.

Wisconsin farmers who have not seen this valuable bulletin, which gives more complete details, should ask for one at their bank, mentioning the fact that they read about the bulletin in The Wisconsin Farmer.

Farmers' Week at Madison.

THIS is the last opportunity which The Wisconsin Farmer will have to call attention to the numerous meetings of importance to be held in Madison February 7th-12th. Attention has been called to these matters in previous issues and several of the programs published. The grain show, under the auspices of the Wisconsin experiment station, the conferences on grain farming, horticulture, drainage, live stock raising and dairying, and the cow-testing conference, are among the matters of interest to come up during this Farmers' Week. Then there are the meetings of all the live stock associations, and of the Wisconsin Alfalfa Order, and the sessions of the home department, and of the country life conference. The spirit of the week is embodied in a twenty-fifth anniversary celebration of the discovery of the Babcock Test, and Dr. Babcock will be awarded appropriate honors. Those who miss Farmers' Week this year are likely to be sorry.

High Wisconsin Grain Yields.

FIGURES recently compiled on the production of grain per acre for the years 1913, 1914 and 1915, continue to show the predominance of Wisconsin and to emphasize the value of seed bought in Wisconsin, because of the heavy yielding strains. The average yield per acre in Wisconsin for 1913, 1914 and 1915 was 34.7 bushels. This is a higher average than any other state which grows any considerable amount of corn, with the single exception of Indiana, where the average was 35.9 bushels to the acre. Such great corn-growing states as Illinois and Iowa had 30.7 bushels per acre and 34 bushels per acre respectively.

The average yield of oats per acre in Wisconsin for the three years mentioned was 36.7 bushels. This is a higher average yield per acre than any other state in the Union. The next closest is Minnesota with 36 bushels per acre, then Iowa with 35.7 bushels and Michigan fourth with 35.2 bushels per acre.

Wisconsin leads all the wheat states in the yield of bushels per acre for the three years named. The average yield was 20.4 in Wisconsin, Iowa second with 19.7 bushels and Michigan third with 18.8 bushels.

Illinois had a slight lead over Wisconsin in the yield of barley per acre. The average yield for three years in Illinois was 29.8 bushels. Wisconsin comes second with 29.3 bushels, Iowa third with 27.3 bushels.

Minnesota led in the yield on rye. For the three years Minnesota averaged 19.1 bushels of rye per acre. Iowa was second with 18.6 bushels and Wisconsin third with 17.5 bushels per acre.

When it comes to big yields of good sound grain, suitable for good seed, it is hard to beat Wisconsin.

Durability of Concrete Posts Makes Strong Appeal.

IN A BULLETIN published recently by the United States Department of Agriculture dealing with the problem of fencing the concrete post receives attention. The author of this bulletin, H. N. Humphrey, states that the greatest care must be taken in the selection of materials used in the construction of this post. Gravel or crushed rock should be used which does not exceed one-half inch or run under one-fourth inch in diameter. The sand used should be clean and sharp. To secure the best results a very rich mixture must be made and should run one part cement, two parts sand and three parts gravel. It does not pay to stint the quantity of cement used, for a very slight reduction in cost caused by the use of less cement will make a very big difference in the quality of the post.

It is important that the mixing of the materials be done very thoroughly. The reinforcement should be placed near the surface of the post, but not nearer than three-fourths of an inch. There should be enough reinforcing wires so that when a force is applied to the post from any direction at least one wire will be in tension. It has been found that when smooth cold-drawn wire is used for reinforcement purposes the bond between the wire and the concrete is not strong enough; when a strain is placed on the post such a wire will slip in the concrete. This may be overcome by cleaning the wire with a strong caustic solution and washing with water, or the same result may be gotten by slightly rusting the wires with a diluted solution of sal ammoniac. Homemade wooden forms may be used in the construction of the posts, but better results can be obtained by the use of steel forms.

Rapid Gains on Swine Made at Low Cost.

SINCE the practice of using the self-feeder in feeding swine has resulted in making not only rapid gains but also inexpensive gains on hogs the question comes up if pursuing this line of investigational work will not sooner or later demonstrate that the hog knows more than his master. Of course, the knowledge referred to includes only a wiser selection of foods when a variety is available than can possibly be made even by the most skillful feeder. If, in the search for truth, we find our own intelligence belittled, it must be accepted simply as one of the penalties of progress. Scientists have been pounding away on feeding questions for generation after generation and it looks now as if all this time the hog was waiting to show that his knowledge is more comprehensive than that of the chemist and his wisdom surpassed that of the most skillful scientific feeder.

Additional proof has come to light that is favorable to the use of the self-feeder in swine feeding operations. This time it is from the Minnesota station. Ten hogs were fed by the self-feeder plan from July 10th to November 15th of last year, a period of 128 days. Each hog was kept in a pen by himself, the object being to accumulate data on the individual animal. Each animal has access to shelled corn, to tankage and to shorts, these products being separate in self-feeders. Five of the pigs were farrowed in March, and at the close of the feeding period, November 15th, they weighed an average of 287.1 pounds. They made an average gain of 1.8 pounds each, and 392.4 pounds of food were required to make 100 pounds gain. These pigs consumed a ration composed of 88.26 per cent of shelled corn, 9.02 per cent of tankage and 2.72 per cent of shorts. At the close of the feeding period the March pigs were 237 days old.

The May pigs were 191 days old when the experiment closed, at which time they averaged 248.4 pounds each. It required, in this case, practically the same amount of grain to make a hundred pounds of gain, namely, 392.54. The younger pigs consumed slightly more tankage, because their daily ration for the feeding period was made up of 86.99 per cent of shelled corn, 10.83 per cent of tankage and 2.19 per cent of shorts.

Swine breeders generally will concede that these are exceedingly satisfactory gains and, furthermore, they will concede that they were made at a very low cost. There is to be considered in addition to the amount of food consumed, the matter of labor, and on this point there is certainly a large saving compared with the old-fashioned system of feeding by hand, particularly in those cases where considerable slop is used.

Producing a Superior Article Pays.

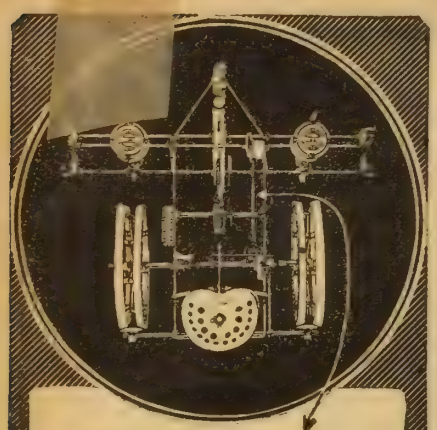
FOR a number of years there has been in existence in Wisconsin, of which many of our readers are aware, what is known as the Wisconsin Experiment Station Association. The members of this association are producing superior grains, such as corn, wheat, oats and barley. They have made a reputation for their grains and as a result are selling them all over the United States for seed purposes, and in foreign countries as well.

Similarly cattle breeding associations have been formed in Wisconsin, Michigan and other states. Farmers in certain communities are all breeding cattle of one breed, such as Holsteins, Guernseys or Short-horns. By reason of this co-operation they have been able to use better bulls than they could have done had they acted independent of each other. Furthermore, producing so many animals of one breed, buyers have been attracted in large numbers to these communities, which in turn has solved the marketing problem.

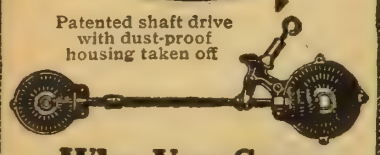
When the Missouri Valley Canners' Association recently met in Kansas City, the fact was brought out that the canning industry has developed wonderfully during the past decade, and that this development has been brought about largely because of putting out superior products. The canned vegetables and fruits of today are so much superior to the products of ten or fifteen years ago that there is no comparison between them, and the result has been an enormous increase in consumption. The output of canned tomatoes, for example, has increased over 100 per cent in the last ten years, and it is destined to grow even more in the next decade, because the canners are organized.

Local associations meet frequently to talk over things of interest to their members, while larger associations hold annual meetings where matters pertaining to marketing are discussed and where means of popularizing their products are studied. Had it not been for this close study of their business and the improvement of their product, it is not likely that consumption of canned goods would have been increased.

We mention these facts to get our readers to thinking about new methods and to get them to study their business more closely. Superior cattle, horses, hogs and sheep, as well as superior grains, forage crops, and all other products of the farm, will always find a ready demand on the market, and the better the article the more it will be sought and at a larger profit to the producer.



Patented shaft drive with dust-proof housing taken off



Why You Save Work and Money with the Shaft Drive

HERE you see a top view of the Janesville corn planter. Note the freedom from needless parts. The construction is simple—easy to handle—easy to take care of.

In using the shaft drive we reduce the number of operating parts generally needed on a corn planter. We discard the clutch—we free you from chains, sprockets, springs and possibilities for gumming up, breakages and needless repair bills. We assure you of having your planter in running shape all of the time. You are not held up waiting to replace broken parts.

Instead of giving your planter a kerosene bath at every round, you grease this shaft drive once a season. Any part showing a flaw in material will be replaced free of charge during life of machine.

Why not save work and worry this year and for many years to come by getting a

JANESVILLE CORN PLANTER

Manufacturers of Farm Implements

The Only One With The Shaft Drive

Here is another feature that you will like on this planter. It has a sight feed. You can see every hill as it drops. You can change the feed without stopping the team—drop two, three or four kernels to the hill as the soil will stand. Here's the best construction for handling silage corn.

You can provide for any quantity of seed corn per acre. Commercial fertilizer attachment, as well as cow pea attachment also, can be furnished.

80 rods of wire, a reel, a disc marker, a full set of edge drop as well as flat drop plates for checking or drilling, furnished with each machine. Made in following models: checking and drilling, drilling only and lister planter.

The Farmers' Open Forum

WITH CONTRIBUTIONS FROM READERS OF THE WISCONSIN FARMER

The Farmers' Institute at Weirgor.

To the Editor:—Fifteen months ago Weirgor was not on the map. It was lying dormant in cut-over lands or forests. In January, 1916, there are in this vicinity 142 families settled and commencing new homes.

Weirgor now has one of the finest district school buildings that one can imagine. There are a couple of stores, a post office, a fine eating place and a good, log community room. An investigation of the soil of that region shows that it is mostly of hard wood origin and good. Splendid streams of the finest kind filled with speckled trout abound. The settlers of the region are of high class and full of hope and determination.

Though the farmers' institute was held at a most unfortunate time, as the farmers were for the most part engaged in logging and other teaming the schoolhouse was filled with a most attentive audience. One farmer drove in seven miles and brought ten people. Mr. and Mrs. John Nelson, of Yarnell, walked ten and one-half miles to get to the institute. This was a great effort, for snow filled the roads. The little community at Meteor turned out and showed that it was made up of progressive people. A committee of three, consisting of John Foss, H. C. Busse and Bert Zettle, was appointed to see that this community has another institute. H. C. Busse, Bert Zettle and Dave Senesac, of Meteor, signified desire to know more about securing a pure-bred bull for that community. Howard Busse asked for milk sheets. H. C. Busse brought along with him his fine family of five sons, and John Foss his fine family of three sons. F. Messerschmidt, of Weigor, showed a sample of splendid Green Mountain potatoes. Much interest was shown in better potato growing, and some time this spring a community potato growers' association will be organized. One of the institute workers said that this was one of the best institutes in which he had worked.

A. C. Thompson, Henry Wilson and F. M. Doyle, of Ladysmith, were present to help make the institute a success. These men are interested in the land about Weirgor and are active in helping the settlers make good. These men, acting as the local committee, were responsible for the general arrangements and advertising which made the institute such a success. With fine soil, fine settlers and a good bunch of boosters back of them the Weirgor community will surely prove to be one of the best farming sections in the state.

E. L. Luther,
Supt. Wis. Farmers' Institutes.

Dynamite a Time and Labor Saver on the Farm.

To the Editor:—The farmers are just beginning to see the importance of using explosives on their farms for such work as blasting stumps, ditches, tree holes, subsoil and hardpan.

Two men can take a case of dynamite, some caps and fuse and very quickly remove a good number of stumps, and they are almost always broken up so that they can be handled with ease for hauling or burning, as the case may be. Then there is no dirt left on them to be removed. Some time ago I blasted some cypress stumps for Mr. J. T. Avret, of Kitson, Ga., some of them as large as seven or eight feet across, but they came out nicely and they were broken up very good. Mr. Avret was much pleased.

Dynamite will dig a ditch where no other method can be used, in such places as swamps and ponds. It does better work in wet ground than in dry.

Anywhere a man can work to punch holes and load them a ditch can be blasted. The blasts lifts the dirt out and scatters it far on each side of the ditch, thereby leaving no big banks of dirt on the sides of the ditch to hold the water back or be washing into the ditch and the jar from the explosion loosens up the earth so that the water can drain into the ditch. A ditch dug with spades have hard sides so that the water cannot drain in and then there is lots of dirt on the sides of the ditch unless it is hauled away, costing time and money. I blasted some ditches that were about four feet deep and five to seven feet wide at top. Blasted ditches have sloping sides, therefore there is no caving. Ditches can be blasted as large as six feet deep and twenty feet wide if the proper method is used.

Trees should never be set in any but a blasted hole, as the blast cracks up the soil so that the roots can grow fast and the moisture can rise. Spade dug holes have hard sides that the young roots cannot penetrate or the moisture cannot rise. Fruit trees set in blasted holes come into bearing one to three years earlier than those set in spade dug holes and the cost per tree for blasting is very light.

If you have clay subsoil and want bumper crops use one-half stick of 40 per cent dynamite about three feet deep and fifteen feet apart and if the work is done at the proper time you will get them. The dynamite cracks up the soil so that the rains can soak in and not run off, as is usually the case, and then moisture can rise and the roots go down deep getting the plant food. As early as possible in the fall this work should be done and when the soil is dry or it will only blow a hole in the ground, doing no good.

L. N. Hodges.

On Poultry Shows.

To the Editor:—I have been reading the articles in your paper on poultry shows and wish to say a few words.

My experience in visiting shows cover the past thirty years and what I consider their greatest weakness still prevails at many places. That is the want of properly grouping the different breeds of fowls and the proper labeling of same.

I have seen shows of beautiful birds so mixed up an owner couldn't find his exhibit.

I don't believe an association can run a show and pay out without looking to the general public for admissions and to get them they must look at their show from the public's viewpoint.

Too many men who have charge of exhibits think because they know all about chickens everybody does, but that is not the case. There is no pleasure in viewing a thing you know nothing about. I have viewed some noted and valuable paintings that, had not the finer points and the name of the artist been given me, I would have passed by, thinking them a daub and would have never known the difference.

Many an order for day-old chicks, a setting of eggs or a trio of good fowls could be written if someone would try to interest the visitors.

Many a person who has visited shows with interest and perhaps to see if their neighbor's birds won a prize come out disgusted because they couldn't even find them and no one seemed to be able to direct them.

About a year ago I visited a show, going quite a distance, to get some stock and eggs. I never saw a better lot of birds, but hardly a coop had a ticket on it to tell whose it was. But there was lots of outside advertising matter in their place, which was all wrong.

I found some birds that pleased me very much, but no one seemed to know who owned them. I was told the secretary had it all down in his book and that he could tell me. I found the secretary had gone to lunch and taken the book with him. It was the third day of the show, the premiums had been awarded and still only a few of the ribbons placed. (I didn't place my order).

Too many exhibitors huddle together and talk "chicken" and forget their exhibit, when if they were on the job with a word of interest, a glad hand and a pleasant smile many an order could be booked from people who just needed a word to have them make a start.

If the exhibitors want to gain knowledge at these shows have a time before the doors open each day and "get together and chew it over," but when your doors are open to the public give your attention to the public. See that your exhibit is in order and your pencil's got a point on it.

All breeds of fowls should be grouped. All cages should be labeled with the same form of card, showing breed, kind of bird, age, what prize it competes for, name and address of owner and if he has stock or eggs for sale and high up over each group should be a sign that could be read from the entrance bearing the name of the breed located there.

If your show is run just to get together don't look to the public for patronage. Go down in your pockets and pay the bills. But that is not why most shows are run. Why do you suppose such shows as the auto show is put on each year at such a vast expense? Just to look over each other's product? Not much! To get orders from the public. That is the only way to get the money out of any business, the chicken business included.

A Farmer.

Kenosha Co., Wisconsin.

How I Grew a Bumper Crop of Rye.

To the Editor:—A tobacco crop was raised on the ground in 1913. Therefore, it was kept well cultivated all summer.

After the tobacco was harvested the ground was plowed about five inches deep and the rye was sown October 1st in the usual way, about five pecks to the acre.

The following spring in order to use the rye as a nurse crop for alfalfa it was necessary to disk the ground regardless of the possible injury to the rye. This was done the 14th of April. Then the alfalfa was sown and harrowed in. The disking and the harrowing made the rye look rather sick for a time, but, as I cared more for the alfalfa than the rye crop, it was immaterial to me.

After a time, however, I noticed that the act of sowing the alfalfa had served as a splendid cultivation for the rye, as it caused it to stool out. The rye grew six feet in height, but lodged a short time before harvesting so that it was impossible to get all of it.

It stood in the shock about a week, after which it was threshed and accurately weighed, an act which showed it yielded 132 bushels and twelve pounds from three acres of ground or an average of forty-four bushels and four pounds per acre.

The alfalfa was rather thin the first season, but this year I had a good crop of alfalfa as well as quite a crop of self-sown rye. It was cut three times, yielding about a ton per acre each time.

No fertilizer was used except the manure, which was put on the ground for the tobacco crop.

A sample of this crop of rye was the one which won the silver medal at the Panama Exposition.

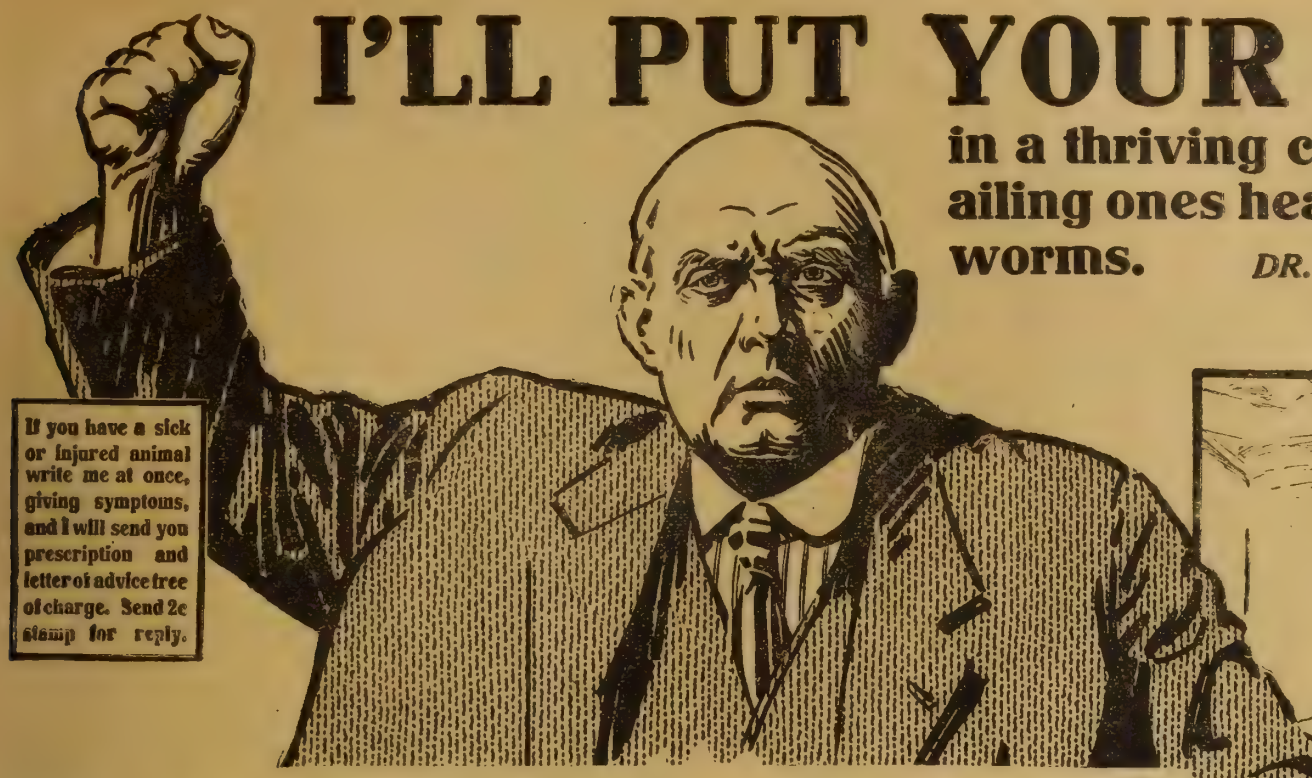
Lloyd F. Hubbard.

The principal grain crops of Canada during 1915 showed the most abundant yield in the history of the Dominion, according to an announcement of the census and statistics office. The increased yield of wheat and oats, it was said, was due to expansion of the acreage by a special effort as a result of the European war, as well as an exceptionally favorable season. The total value of field crops in 1915 amounted to approximately $800,000,000, comprising grain, $568,161,000,900; potatoes and sugar beets, $36,739,500. and fodder crops, $192,768,100. Total yield of wheat for 1915 was 376,303,600 bushels, compared with 161,280,000 in 1914. The quality of the crops, it was said, was superior to 1914, and also superior to the average of the last five years.

I'LL PUT YOUR STOCK

in a thriving condition, make the ailing ones healthy and expel the worms.

DR. GILBERT HESS
Doctor of Veterinary Science
Doctor of Medicine



If you have a sick or injured animal write me at once, giving symptoms, and I will send you prescription and letter of advice free of charge. Send 2c stamp for reply.

Why Pay the Peddler Twice My Price?

I urge every farmer to see to it right now that his work horses are put in condition for the hard work of spring and summer, so that when the sun shines your horses will be rid of their old coats, full of stamina and ready for business.

And don't overlook the spring pig crop—the mortgage lifters. Start them off free from disease—free from worms.

Be sure, also, that your milk cows are thoroughly conditioned for the long, heavy milking season, and that those with calf are vigorous and fit.

Remember, your stock have been cooped up for the last few months and have been on dry feed. As corn or oats, hay and fodder do not contain the laxatives and tonics so abundantly supplied in grass, your stock are pretty apt to be out of fix. Some of your animals are liable to be constipated, rough in hair, their legs may have become stocked, or they have dropsical swellings, but the most common disease of all, especially among hogs, is worms—worms.

DR. HESS STOCK TONIC

25-lb. Pail, $1.60. 100-lb. Sack, $5.00

Highly Concentrated, as the Small Dose Quantity Proves

Now, as a worm expeller, I will go the limit in guaranteeing my Stock Tonic. To clean out your hogs, put in the swill one tablespoonful of my Tonic to every two hogs twice a day and you'll make short work of the worms. Dr. Hess Stock Tonic is

A Sure Worm Expeller
A SPLENDID TONIC

This preparation of mine is 24 years old, farmers everywhere have tested it. I feed it to my own stock, for I know that it contains the necessary ingredients for enriching the blood, improving the digestion and assimilation, keeping the entire animal system clean and well regulated.

Now here is my guarantee to you—a guarantee that my dealer in your town will back up in letter and spirit; it must surely convince you of the undoubted faith I have in this preparation—read it very carefully:

So sure am I that Dr. Hess Stock Tonic will put your animals in a thriving condition, make the ailing ones healthy and expel the worms, that I have authorized my dealer in your town to supply you with enough for your stock, and if it does not do as I claim, return the empty packages and my dealer will refund your money.

And here are my prices—just half what the peddler charges: 25-lb. pail, $1.60; 100-lb. sack, $5.00. Smaller packages as low as 50c (except in Canada and the far West and the South). Sold only by dependable dealers who are known for square dealing.

I have a book about Dr. Hess Stock Tonic that you may have for the asking.

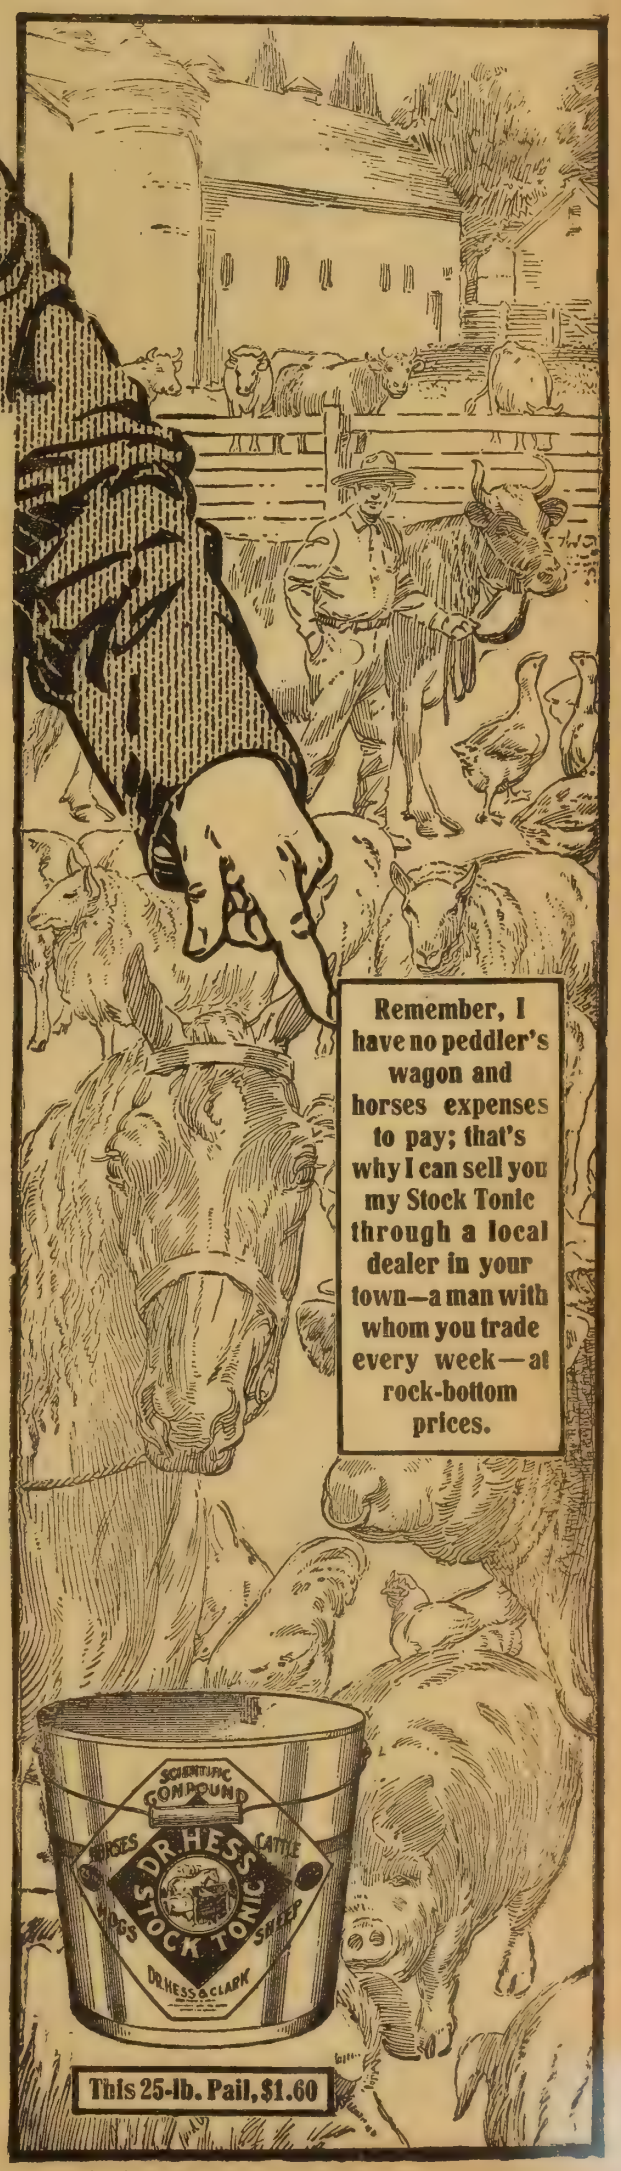
DR. HESS & CLARK, Ashland, Ohio

Dr. Hess Poultry Pan-a-ce-a

This is just the time you should be giving your poultry this splendid tonic. It will put them in fine condition, make your hens lay, ensure fertile hatching eggs and strong, vigorous chicks. Very economical—a penny's worth is enough for 30 fowl per day. Sold only by reliable dealers—1½ lbs. 25c; 5 lbs. 60c; 25-lb. pail, $2.50 (except in Canada and the far West). Guaranteed.

Dr. Hess Instant Louse Killer

Kills lice on poultry and all farm stock. Dust the hens and chicks with it, sprinkle it on the roosts, in the cracks, or, if kept in the dust bath, the hens will distribute it. Also destroys bugs on cucumber, squash and melon vines, cabbage worms, etc., slugs on rose bushes, etc. Comes in handy, sifting-top cans. 1 lb. 25c; 3 lbs. 60c (except in Canada and the far West). I guarantee it.



Remember, I have no peddler's wagon and horses expenses to pay; that's why I can sell you my Stock Tonic through a local dealer in your town—a man with whom you trade every week—at rock-bottom prices.

This 25-lb. Pail, $1.60

Special Sale during January and February

Buggies and Engines

We are making special inducements to early buyers during January and February that will enable you to make a bigger saving in the purchase of an American Beauty Buggy or an Economy Engine than you can make at any other time of the year.

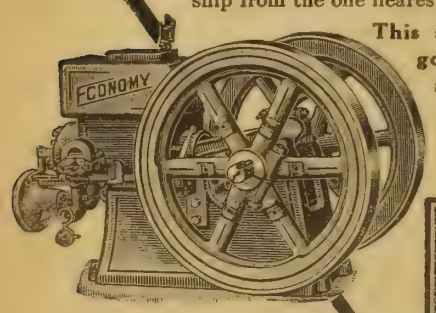
Don't buy a buggy or engine until you have seen this special proposition, as it means a big saving to you.

If you are interested in a Gasoline Engine, write for our special January and February Engine Proposition No. 74W80.

If you are interested in Buggies, write for our special January and February offer on American Beauty Buggies No. 74W80.

Shipped From a City Near You.

We carry six styles of American Beauty Buggies and a full line of Engines, Trucks, Saw Rigs, Grinders and Pumping Outfits in fifteen different cities and we ship from the one nearest you.



This special proposition good during January and February only. Write for it today.

Investigate The Zimmerman Mighty Monarch Steel Stump Puller Before You Buy

Don't overlook the biggest value your money can buy. The new improved Zimmerman Mighty Monarch Steel Stump Puller is a tried and tested machine—not an experiment. Best stump puller on earth—in construction, improvements and operation—we'll prove that. New improved model Zimmerman Mighty Monarch pulls ANY stump—cannot be broken in legitimate service. Absolutely safe—child can operate it. Cheaper to use than dynamite and good for lifetime service.

PULLS 200 TO 600 STUMPS PER DAY

Works faster and easier than any other stump puller—has every modern improvement. Built of steel—same quality as we furnish to the U. S. Government. Write for new catalog. It's free. Don't buy any stump puller until you know all about the Zimmerman Mighty Monarch. We'll prove every claim we make.

ZIMMERMAN STEEL CO., Dept. WS ***Bettendorf, Iowa***

ROLLER FEED MILLS

GRIND A WAGON LOAD OF FEED FOR 10 CENTS.

THIS is the **Famous Howell Roller Mill** you have heard so much talk about. The new improved mill for the scientific grinding of grain. Old style Burr and Stone Mills are out of date. Thousands of them are being annually replaced by the Famous Howell Roller Mills. Grinds twice as fast as the best burr mill made. Does not heat the feed. Grinds Graham and Rye flour as well as feed. Has big capacity. Requires little power. No burrs or stones to wear out. Guaranteed to last a life time. Made in 13 sizes suitable for any size engine. Save one-half your time, gasolene and money by using a Howell Roller Mill. Write for catalog D.

R. R. HOWELL & CO., Migrs., Minneapolis, Minn.

CURRENT EVENTS

PRESIDENT WILSON left Washington last Thursday on his swing around the circle of the middle West. He went first to New York City, where he delivered the first of a series of addresses urging greater national preparedness for war. After that he headed west, stops being planned at Pittsburgh, Cleveland, Milwaukee, Chicago, Des Moines, Topeka, Kansas City and St. Louis. Addresses were planned for each of these cities, practically all of them expressing the president's views on this same subject: Preparedness for war by means of a vastly increased army and navy. The president is staking much upon his present trip, not the least being the possibilities of his own renomination and re-election. He holds to a middle course on preparedness, commending the plans of the secretary of war for a larger standing army and for a new continental army of 300,000 young men, to serve three months each year for three years and then hold themselves in readiness to be called to the colors at any time in the future. He is not in favor of universal military service, however, and thus finds himself opposed to both Roosevelt, who favors universal service, and Bryan, who opposes any extension of our defenses whatever. The president devoted the greater part of last week preparing his addresses, which bid fair to be notable in our national history. It is practically the first time a president has come to the people, in their homes, urging any great idea of an absolutely non-partisan character and represents a new idea in our governmental relations. President Wilson plans another and similar trip later on, which shall take him through the South, as far west as Denver.

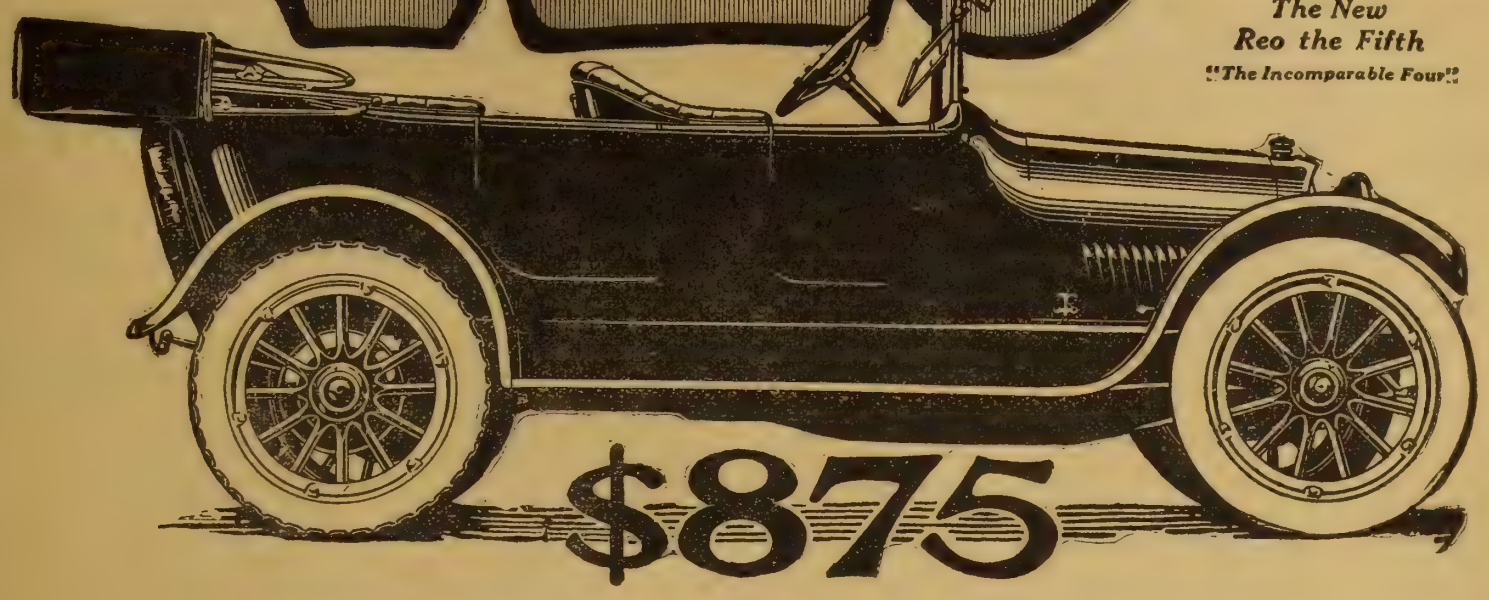
BY UNANIMOUS vote the United States Supreme Court has declared the federal income tax to be constitutional. As a result, leaders in congress predict that it is only a question of time until a definite movement is put on foot to levy more heavily on the revenues from great private fortunes for some of the millions the government must raise to carry out the army and navy increases. It is not likely that smaller incomes will be levied more heavily upon at first, but the larger ones are almost sure to suffer. "The supreme court's decision has absolutely unfettered the income tax as a source of revenue," said Representative Hull, of Tennessee, author of the law. "All doubt is removed and congress is left much freer to act. I believe congress will take advantage of the opportunity to amend the law materially. Without any unusual or unjust charges it can be made to yield $185,000,000 to $195,000,000 a year, as against $85,000,000 or $90,000,000 at present." Proposals are pending in congress to tax incomes of more than $1,000,000 a year as high as 50 per cent.

"FEAR God and take your own part," was the theme of a stirring address delivered by Theodore Roosevelt last week. He took occasion to denounce the proposed continental army plan (by which 300,000 men are to be enlisted, to serve three months each year for three years and then hold themselves ready for future service if needed) and to oppose a large regular army, but advocated universal military service, starting in the public schools at the age of sixteen, with four or six months actual service in the field, with the colors, between the ages of eighteen and twenty-one. He pleaded for a larger navy and opposed Senator Cummins' views on exclusive governmental ownership and operation of munition factories, saying: "We should at once begin governmental encouragement and control of our munition plants. To make war on them is to make war on the United States; and those doing so should be treated accordingly and all who encourage them should be treated accordingly. The existing plants should be encouraged in every legitimate way, and provisions made to encourage this continuance after the war. But it is most unfortunate that they are situated so near the seacoast. The establishment of munition plants further inland should be in every way encouraged and promoted. Pittsburgh is as far east as any plant should by rights be placed." Colonel Roosevelt declared he was in favor of the deportation of disloyal immigrants to their native lands. He praised Germany, in particular, for its military efficiency and its national cohesion. The speech was the most notable public utterance of the former president for some months and shows him opposed to President Wilson's preparedness plan, but favoring even a greater degree of national readiness for war than the president himself favors.

LITTLE has been given to the public concerning any of the campaigns of the European war in the last week. The report that Montenegro had accepted the peace terms granted it by Austria was emphatically denied and at last reports Montenegro was still allied against the Germans and Austrians, but practically all of its territory was in the possession of the enemy, the king and queen having fled, first to Italy and then to France, and the remnant of the army having crossed over into Albania, where it must fight hostile tribes. The Germans and their allies are now in possession of practically all of Belgium, Serbia and Montenegro and the most valuable part of France, while not a foot of German territory, except the colonial possessions, is occupied by the enemy. At the same time, the allies continue to claim that with the coming of spring they will be able to reverse the tables, and, with re-enforcements and plenty of munition, will be able to push the invaders back and gain the upper hand for the first time in the war. The British are said to have been defeated by the Turks in Asia, but no details are forthcoming. The result of the anxiously awaited debate in the British parliament on the blockade question is that the British government adheres to its existing policy. A resolution that the entire over-oceanic traffic with Germany should be prevented by a blockade, was talked out and the subject dropped, thus leaving the position exactly as before the debate, except that parliament seemed more converted to the government policy.

ENDORSEMENT of Secretary Garrison's efforts toward enlargement of the nation's military forces was voted by the National Security League in session at Washington last week, practically every state being represented. The plan of the present secretary of war was approved by two of his predecessors, Elihu Root and Henry L. Stimson, both of whom had held the war portfolio under republican presidents. George W. Wickersham, attorney-general in President Taft's cabinet, went even further than some of his league associates and advocated universal military service and immediate repeal of the law under which the national guard would be called into service in advance of volunteers. The only vote against the military preparedness program was cast by a delegate who said he represented the governor of Indiana. Aside from his protest the resolutions were adopted unanimously. Universal military service was likewise advocated before the league by Senator Chamberlain, of Oregon, chairman of the senate military affairs committee. Recognizing that the people were not ready for such a step, however, the senator said Secretary Garrison's continental army plan might be utilized to provide the force which the country must have to guarantee its security as a world power, protect the Panama canal and be ready to repel possible aggression from either Europe or Japan. Senator Chamberlain said among other things: "There is not a country in Europe that feels kindly toward us today and we know it."

REO



This Is Reo Year

EVERYTHING POINTS to that—everything indicates not only that the coming year will be the greatest Reo has ever known, but that the Reo policy and product will exert a greater influence on the automobile industry than ever before.

ALREADY YOU'VE NOTICED the tendency to emulate Reo in many features of design and construction—the "Sheerline" body of the New Reo Six is the acknowledged fashion plate, while Reo cantilever springs, Reo control and countless other mechanical features are being imitated as nearly as may be.

BUT AS THE YEAR PASSES you'll see more evidence of Reo influence on the trade generally.

FOR EXAMPLE, there's a greater divergence of engineering ideas this year than ever before. There's more types of motors and of cars—and no one dominant type.

OUT OF THAT CONFUSION—that babel of tongues arguing about and disputing over countless new and radical ideas—will come the decision that most or all of them are only engineering fallacies.

REO HAS BEEN CRITICISED for what some term our ultra-conservatism.

WE DON'T MIND—that has been the chief factor in the splendid Reo success. We don't change easily or often so we make less mistakes than others.

WE DON'T EXPLOIT our friends—so we keep them. We hold as sacred the confidence of Reo buyers—and as a result, this industry knows nothing that quite equals the loyalty of the Reo clientele.

AND SO WE SAY that this year of radicalism; this year of wild experimenting; this year of confusion will prove to be the Reo Year—because it will vindicate as no other year ever has, the Reo policy.

IF YOU ARE of an inventive or an adventurous turn, this is a great year to gratify your propensity for experimenting.

BUT IF YOU ARE one of those more serious minded persons who want value for your every dollar; who buy an automobile for service, not for the stunts it will perform:—

AND ABOVE ALL if you'd be certain when you draw your check that you are getting the best there is to be had in Simon pure automobile value and the lowest in maintenance cost—then come along with us—for this is Reo Year.

Reo Motor Car Company, Lansing, Michigan

117-(c)

Twenty-fifth Dairy Anniversary.

Farmers' Week This Year Will Be So Arranged as to Emphasize the State's Wonderful Progress in Dairy Industry.

EACH year in connection with farmers' week at the college of agriculture at Madison emphasis is laid upon some particular line of farming. This year dairying will feature the course during the second week in February, this being the twenty-fifth anniversary of the discovery of the Babcock test which has had so much to do with dairy development. It is also the twenty-fifth anniversary of the Wisconsin dairy school and the quarter centennial of the organization of the state dairy and food commission.

During this quarter of a century Wisconsin has advanced from the rank of seventh to first in dairying in the United States. It is appropriate that farmers of this state should, at this time, mark the advances which have been accomplished during the last twenty-five years.

Many of our present dairymen remember distinctly the situation twenty-five years ago—the difficulty they were having in building up their herds; the fight which the creameries and the cheese factories were having against the milk adulterators; the filled cheese fraud and the oleomargarine mixers. So it was when Dr. S. M. Babcock, of the Wisconsin College, gave his butter fat test to the world and the food and dairy commission was created that the means alone can decide. In the hope that it may benefit some who are striving to improve their stock and enable creameries to avoid the evils of the present system the test is given to the public.

The Wisconsin Farmer files of that time contain columns of matter relative to the test and it was estimated that this discovery, which was not patented and which Dr. Babcock gave to the public, was worth $100,000 to him. Time has certainly proved it worth many times $100,000, and had Dr. Babcock patented his test he certainly would have been rated a millionaire today.

The first machine was manufactured by Cornish, Curtiss & Greene, of Ft. Atkinson, and later by F. B. Fargo & Company, at Lake Mills, and by A. J. Decker, at Fond du Lac. It was first shown at the Wisconsin State Fair in the fall of 1890. Four models were exhibited—one by each of the above four firms and the original model perfected by Dr. Babcock, which is still in existence today and stands in the dairy school building at Madison.

Then began the campaign throughout the farm and dairy press for the use of the test, and The Wisconsin Farmer is pleased to note at this time the support it gave them in encouraging universal use of the test. Our files show hundreds of articles and editorials explaining the Babcock

DR. STEPHEN M. BABCOCK AND FORMER DEAN W. A. HENRY. TAKEN IN FLORIDA.

for improving these conditions were provided.

The Wisconsin Dairymen's Association, which was in existence at that time, the Wisconsin Buttermakers' Association, the Wisconsin Cheesemakers' Association and the various live stock breeders' associations have contributed much during this quarter of a century to Wisconsin's dairy success and these, with all other organizations which were working to the same end, will share in the celebration of "Twenty-five Years of Dairying" during farmers' week.

The Babcock test has stood through time and is essentially in every respect the same it was when Dr. Babcock gave it to the world a quarter of a century ago. Even the markings on the test tubes remain unchanged and so well did he build that nothing of greater value to dairying has been developed to this day. The test uncovered that one thing which the dairymen did not know and undoubtedly has done more toward the improvement of dairy herds than anything else. Prior to the discovery of this test there were two tests on the market—one known as Short's method, which was also developed at the Wisconsin College and the other the Patrick method, which came from Iowa.

That Dr. Babcock, who completed his work in 1890, built better than he knew at that time is indicated by this paragraph taken from his story of the discovery which appeared in The Wisconsin Farmer in the issue of August 15, 1890, the day that Dr. Babcock announced his discovery of a means to accurately determine the amount of fat in milk, to the world:

Whether this test will find a place . . . those already introduced time test and in fighting the conditions which have been largely overcome through the test and which has enabled Wisconsin to become the leading dairy center of the nation. On March 7, 1891, The Wisconsin Farmer contained this editorial:

The prudent dairyman will have a Babcock tester and a pair of scales he can depend upon so that by weighing and testing the cows' milk he can tell how much he is getting from each.

About the time the Babcock test was given to the public the dairy school was founded by Dr. Babcock and Dean W. A. Henry. This was the first school in America to attempt to give a definite course in the instruction in the science and art of dairy manufacture. Its first home was an old residence, and certainly the hundreds of buttermakers and cheesemakers who have taken the course there have been instrumental to a large degree in putting quality into our dairy products.

The food and dairy commission was created April 16, 1889, with H. C. Thom, H. K. Loomis and Prof. F. G. Short, who developed the Short method of testing, as commissioners.

All was not easy sailing for the commission, the maintenance of which during the last quarter of a century has done much towards improving dairy conditions. That this fight was a hard one is indicated by the following editorial defending the commission in The Wisconsin Farmer, issue of February 14, 1891:

It is a fight for life with them (meaning the oleo mixers; adulterators and filled cheese makers) but in an unjust cause. It will be a shame and a disgrace to the state if they gain a victory.

Wisconsin, it is thus evident, has not attained its enviable reputation as a dairy state, without a struggle. The press at that time was filled with advice on herd improvement, just as it is today, despite the wonderful advancement. Strenuous efforts were being made to get farmers into dairying and the following points for encouragement by H. C. Adams, which were published in The Wisconsin Farmer, May 2, 1891, are more or less true and applicable today:

Points for encouragement for the small dairyman.

1. In the fact that he can do his own work.
2. In the fact that the best dairy breeds are constantly increasing the maximum limit of butter production.
3. Because buyers are becoming more critical and better able to pay for what they want.
4. Because new machinery and new methods are diminishing the cost of each pound of feed and increasing the butter production of each acre of land.
5. Because his income is certain and his investment sure.

During the twenty-five years which has lapsed since the Babcock test was given to the public it must be borne in mind that Wisconsin has advanced steadily in dairying.

The most reliable statistics available as to that time shows that Wisconsin had only 792,600 milk cows in 1890, while in 1916 the total was more than 1,600,000. This is a gain of almost a million in twenty years. It was then estimated Wisconsin produced 60,000,000 pounds of cheese annually while conservative estimates are that the cheese produced in 1915 was 200,000,000 pounds or about 55 per cent of cheese made in America.

The government census of 1890 shows that 303,700,000 gallons of milk were produced on the farms and 458,320,000 gallons in 1909, the latest figures available. The 1909 statistics census showed 1,474,500 cows.

Many things have aided in making Wisconsin the leading dairy state. The King system of ventilation, which was the discovery of a Wisconsin man, has had to do with making our cow homes more comfortable and sanitary; the nearness to markets, Wisconsin having 20,000,000 persons within a night's ride, ideal climate, fine pastures, etc., all lending a helping hand.

Camels are fit to work at five years of age, but their strength begins to decline at twenty-five, although they usually live to be forty.

A TRACTOR ON EVERY FARM

Keep fewer horses. Let the Eagle Tractor do your plowing easier, quicker, cheaper—and you'll need less hired help. Then when you require Belt Power the **Eagle Gas Tractor** will be right on the job. It is the famous Eagle two-cylinder engine built for tractor service.

In the **Eagle Tractor** you get superior engine qualities—3-bearing crank shaft---cylinders cast in pairs---valve-in head action which gives more power and cleaner combustion for both tractor and belt work. You get **compactness** which specially fits it for small farm work.

Why buy for tractor work alone? Why buy a portable engine? You can get **both** in the **Eagle Gas Tractor**. Why do without a tractor, when you can get one built to fit Wisconsin farm conditions at a reasonable price—and save money by using it?

Every **Eagle Tractor** has four wheels with two drivers, also radiator, pump and fan, sliding gear shift and four block clutch applied at rim of pulley. High tension magneto with impulse starter does away with batteries.
Write for full description and prices.

Eagle Mfg. Co. 622 Winnebago St. Appleton, Wis.

Use It For Everything

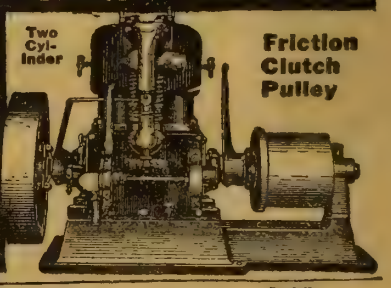
4 H.P.—190 lbs.

The 4 H. P. Cushman Handy Truck Outfit is the most useful outfit ever built for farm work. The engine weighs only 190 lbs., and the entire outfit only 375 lbs. A child can pull it around from job to job.
Besides doing all the farm and household power jobs, this 4 H. P. Cushman may be lifted from truck and hung on rear of binder during harvest to save horses and save the crop.

Light Weight
Cushman Engines

Built for farmers who need an engine to do many jobs in many places instead of one job in one place. Throttle Governed, with Schebler Carburetor. Run very quietly and steadily—not with violent explosions and fast and slow speeds like old-style heavy-weights. Engine Book free.
CUSHMAN MOTOR WORKS
855 N. 21st Street Lincoln, Nebraska

8 H.P.—320 lbs.



HOME MADE Concrete Mixer PLANS FREE

Send me your name and I'll send you, absolutely free, blue-print plans and complete instructions for building a practical, thoroughly-proven home-made concrete mixer. Hundreds have used my plans successfully. So can you.

Stop Egg and Feather Eating.

Some Things That Will Prevent It--By J. G. Halpin and J. B. Hayes, of Wisconsin College of Agriculture.

THE profits will be small if you keep hens that eat their eggs. This vice often exists for a long time in a flock before it is discovered. By the time it is found, it is probable that many of the hens have formed the habit. Whoever gathers the eggs should watch for the slightest indication of eggs having been broken in the nest.

If an egg has been eaten, the litter in the nest will be moist and will need replacing at once with clean, dry straw or shavings. The yolk of the broken egg will often be smeared on the feathers about the head of the guilty hen. This hen must be re-removed from the flock before others learn the habit. It is well to confine, for a day or two, a suspected hen so as to make sure that the egg was not accidentally broken and eaten.

Egg eating usually starts from an egg accidentally being broken in the nest, or from hens laying soft-shelled eggs. In some cases where hens are not well supplied with shell-forming material, the habit may be started from feeding egg shells that have not been crushed before feeding. Many flocks, too, will break and eat eggs that they see other hens lay on the floor, but will not interfere with eggs laid in the nests. At other times, hens learn to eat eggs because they are too closely confined, or because they are fed a ration lacking in egg-forming material. In such a case, the hen is especially greedy for the contents of the egg. Sometimes the lack of shell material is the cause. The hens often break the eggs, eat the shells, leaving the rest of the egg. In such a case the feeding of oyster shell and green bone will help to correct the trouble.

Whenever the trouble is noticed in the flock it is advisable to change the ration, give more range, or do whatever seems to be needed to correct conditions. If the trouble is not general, but confined to one or two hens, watch for them and use them on the table unless they are valuable for breeding purposes. If they are valuable for breeding cut the tip end of their beaks, removing thin slices until you note that blood will follow if more is removed. This makes the beak so blunt that the hen cannot readily break the egg, and also makes the beak tender. Occasionally a hen has the habit so fixed that even this treatment will not help. At the experiment station success has not resulted from the feeding of eggs containing pepper or other irritants, such as are frequently recommended.

To prevent egg eating, feed a well-balanced ration and give access to oyster shells. Keep all nests well littered so that eggs are not likely to be broken. Induce the hens to take plenty of exercise by feeding all grain in a deep litter of straw, whenever the flock is confined to the house. Provide darkened nests, so that the hens are not likely to see that an egg has been broken, and so that hens will not be likely to frequent the nest except when ready to lay. Gather the eggs frequently. If the eggs are allowed to accumulate in the nests the danger from breakage is greatly increased.

Feather eating is one of the worst habits of chickens and is often attended with loss. Fowls acquire this habit in three ways: First, from having nothing to do; second, from being fed a poorly-balanced ration; and third, from eating feathers smeared with blood plucked from table poultry.

This habit is most often seen in flocks that are closely confined. In some cases the hen that is attacked does not resist and the outer ends of the feathers are removed. At other times the entire feather is pulled out, especially if the hen that is attacked tries to get away. Both hens' pulling usually results in the removal of the feather.

Most feather eaters at first pull the feathers from the rump or the neck. If "pin" feathers are removed or the muscles at the base of the feather become torn, bleeding follows and the other hens in the flock, becoming cannibals, kill the hen unless she is removed. This trouble not infrequently develops among brooder chicks, causing severe losses.

Some hens seem to develop feather picking even when kept under good conditions, and unless valuable for breeding purposes, should be killed. If the hen is valuable, temporary relief may be had by trimming the beak so that the mouth parts cannot be shut close enough to grip a feather. At the experiment station three years ago a hen that had already learned the habit was kept from doing damage by trimming her beak once a month during the winter.

Where the trouble seems to be general in the flock, relief can sometimes be had by hanging pieces of tough, lean meat in the pen and letting the hens pick at it. This gives them something to do, which is essential. At other times the worst offenders can be removed. These are usually the ones that have been damaged the least. All grain feed should be fed in a deep, dry litter and as much range as possible given. If the flock still persists in feather eating it is avisable to dispose of the entire flock. Where the flock persists in picking at only a small area, barbadoes aloes can be smeared on the feathers with good results.

It has been noticed that many times birds on exhibition in the show room develop this vice, but it is usually temporarily relieved by heavy feeding on bologna sausage. The trouble usually stops as soon as the birds are released. Since all vices are likely to be the result of idleness, it is important to keep the flock busy.

During the winter hens frequently attack the male's comb, picking at it gently at first until the blood starts, when other hens join in and the comb is soon ruined. This often happens if the comb has been frosted. Sometimes the trouble will spread, the hens attacking other hens in the flock, sometimes killing them. This is usually the result of idleness and can only be treated by removing the injured bird. Do everything possible to keep the flock busy and contented. The suspending of strips of lean meat or vegetables far enough above the floor to force the fowls to jump for it, or the feeding of grain in a deep litter, are recommended as remedies.

The Wisconsin Guide Sign Association has taken up the work of marketing the roads in La Crosse county, under the guide-board law. This association established headquarters in Milwaukee at the Wisconsin Hotel and Bart J. Ruddle is in charge. The plan is to carry the campaign into all the counties of the state.

Uncle Sam made $2,500,000 last year from the sale of wood from the government forests.

When Detroit, the city

that produces more than three-fourths of the cars manufactured in the United States, shows by official figures for the entire year of 1915 MORE Studebakers in use on Detroit streets than any other car selling at more than $500

—what surer judgment can *you* follow in buying a car?

Think for a minute—think what that Studebaker Leadership in Detroit means to YOU. If a friend of yours has a car, you'd take his advice on buying a car in a minute—figure in your own mind that he ought to KNOW. Here's a whole city that KNOWS cars—and knows them better than any other city on the face of the earth. For Detroit's BIG industry is making cars. And so many people in Detroit are either directly engaged in the industry or else come into daily touch with others who are, that knowledge of cars is far more general and EXACT than in any other community.

And so when Detroit makes Studebaker its own Preference in cars—no man can overlook that judgment, whether he's running a farm in Illinois, a ranch in Colorado or a fruit orchard in California. For it means that in the judgment of the city that knows cars BEST, Studebaker gives the top VALUE of the market.

See the Car that Detroit PREFERS. See this new FORTY Horse Power, SEVEN passenger, SERIES 17 Studebaker at $845—the GREAT 4-cylinder Value of the year.

Six Reasons for Avery Tractor Success

THERE are more acres plowed by Avery Tractors and Plows than by any other make. These are some of the reasons why so many men are buying Avery Outfits:

First—Special sliding frame which makes possible the elimination of the intermediate gear, shaft and boxings. An Avery Tractor has the least gears, the least shafting and the least bearings of any two-speed, double-drive tractors built — which means more power and longer life.
Second—Two rear drive wheels and two speeds—a big advantage over single-drive and one-speed tractors.
Third—Slow-speed, heavy-duty opposed motors—not high-speed, light automobile motors.
Fourth—Crankshafts are one-half the diameter of the cylinder or more. There has never been a broken Avery crankshaft.
Fifth—Motors have renewable inner cylinder walls. These parts, which are subject to the most wear, can be replaced without buying entire new cylinders.
Sixth—No pumps and fans.

Complete Outfit—Tractor, Plow and Thresher—Built and Backed by One Company
A company with a large factory and many branch houses, which insure prompt and permanent service. Avery Plows in all sizes from 3 to 10 bottom. "Yellow-Fellow" Separators in sizes to fit each size tractor.

Prices—3-plow Tractor, $760 cash; 4-plow, $1120 cash; 5-plow, $1680; 6-plow, $2145; 8-10-plow, $2475. Special small size tractor, $295.

Ripening a 1915 Corn Crop.

Practical Experience of Noyes Raessler, a Rock County, Wisconsin, Grower of Golden Glow Wisconsin No. 12 Corn.

AS MY 1915 crop of Golden Glow was handled no different from that of any other season I will briefly outline our system. This involves nothing which cannot be carried on by the average farmer to a very good advantage. We must bear in mind that corn as we know it today is a comparatively new crop, very highly developed by plant breeders for production of grain. It is said that a good stalk of corn will produce an ear equal to its own weight. If exposed to unfavorable conditions the ear is the first to suffer.

How often have we noticed that crib corn, although apparently of good germination, failed to produce a satisfactory yield of corn, while the stalk appeared to be of fair size. The exposure to dampness and freezing weakened the vitality of that seed and the ear, being the most highly developed, was the first to suffer.

What happens to the dairy cow when we turn her out on a cold winter day? The milk flow is reduced very materially. Her milking properties were abnormally developed and are the first to suffer under favorable conditions even though we may give her plenty of feed.

If we expect to improve our corn we must follow a definite means of controlling each seed ear. True, there is a certain amount of new seed corn in Wisconsin even this year, but the supply is very limited and cannot be expected to reach very far over the great area to be planted next spring. Only about 25,000 bushels has been reported and it will require something like 300,000 bushels of seed to supply the entire state.

I attribute my succees in ripening the past year's crop to three things: Good seed and thorough cultivation. This sounds simple enough, but in reality it means a man's job while it lasts.

Seven years ago I started breeding Golden Glow (Wisconsin No. 12) for high yield, early maturity and uniformity. This variety appealed to me because it seemed to mature over a very large territory and grew into popularity so rapidly—from Mississippi to northern Wisconsin it has found a permanent home with many farmers. My first step in the right direction was to start an ear-to-row breeding plot and after seven years I am more convinced than ever that this is the only sure means of breeding up seed corn.

Only the very best ears are selected for the ear plot. An equal number of hills are planted from each ear and in the fall it is a simple matter to compare yielding powers of those ears, also their trueness to type and the time of ripening. Those ears having the best breeding qualities are selected for the next year's ear plot after visiting a number of fairs in competition with other ears of the same variety.

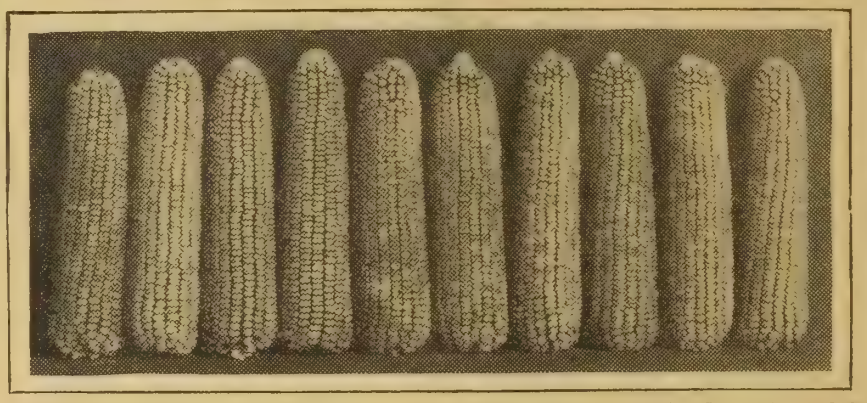
For the past four years the banner rows in our breeding plot were planted from prize winners only and each ear is planted in our fields unless it came from a parent which produced 100 bushels of shelled corn or more per acre in the breeding plot.

In our system of rotation we use clover every fourth year. After the first cutting of hay is taken off we begin to spread manure over the meadow, aiming to feed the second crop, only to plow it under when in full blossom. The field is then harrowed well and sown to winter rye, which acts as a cover crop during the fall and winter. In the early fall and winter another dressing of stable manure is applied to the rye and in the early spring the rye is plowed under for green manure. Immediately after the plowing the disk harrow is used to work up the sod as finely as possible. Again in a week or ten days the same thing is repeated. This may be termed a weed-killing process, as it destroys millions of tiny weeds before they have become troublesome. The first week in May the fine-tooth harrow completes the work of preparation.

Planting is begun May 10th, dropping three kernels to the hill in rows three feet six inches apart each way. A roller follows the planter firming the soil over each hill so that even if the planter happened to go a little too shallow in some places those hills will not be delayed in coming up.

We aim to harrow again twice before the corn is through the ground to keep the weeds in check.

As a rule from ten to fifteen days after planting the first cultivation is begun. No riding cultivator is allowed in our cornfields under any consideration. We start with an eight-shovel, two-horse walking sulky which straddles the row. One row to each cultivator has in our experience proven by far the best way to produce the bushels. Starting at a depth of three inches the cultivators are run more shallow each time through until about the first of July, when the sulky is replaced by a twelve-tooth one-horse cultivator. The latter is run at intervals of a week or ten days until the tassels appear. By this time the corn has been cultivated from eight to twelve times. To some this may look like a waste of labor, but we have kept the soil aerated, conserved the moisture and kept down the weeds thoroughly, even now the field is not laid by. The hoes are used freely from July until the last of August, cutting out all weeds which have escaped the cultivators and any suckers found robbing the soil of plant food which belongs to ear-bearing stalks are cut off close to the ground as soon as they are discovered.



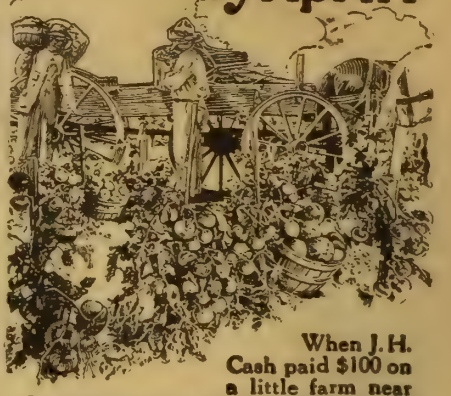
PRIZE-WINNING GOLDEN GLOW. ALL FROM ONE ROW IN THE EAR PLOT OF NOYES RAESSLER, ROCK COUNTY, WISCONSIN.

As our entire corn crop is pure bred and grown for seed we do our harvesting somewhat different from the ordinary way. In September as soon as the ears are fully matured we begin husking, one row at a time for each man. The ears are weighed, sorted and hung in the dry house by a good fire the same day they are picked. The binder cuts off the stover and when enough bundles accumulate the shocks are set up and tied firmly near the top. Our dry houses are provided with plenty of windows and ventilators so that a current of air is constantly passing through the buildings carrying off the moisture as fast as it leaves the corn. The secret of securing the very strongest seed, according to our best authorities, is first allowing the corn to mature; second, picking before frost, and, third, getting rid of the moisture as quickly as possible.

After filling our dry houses for four years we have never experienced any trouble in securing from 98 to 100 per cent germination whether the weather in the fall of the year is damp or dry.

At the end of six weeks' drying the seed corn is ready for testing and shipping. Most all of our seed corn is sold on the ear in crates holding one bushel each. The business farmer of today is willing to pay a fair price for seed in which he can see what he is getting, but he will hesitate at buying shelled corn which has lost its identity, as it does when removed from the ear.

A crop harvest by April 1st



When J. H. Cash paid $100 on a little farm near Camden, Ark. he had just $40 left—yet in three years he cleared his debts and bought 80 acres more. Its easy to understand why farmers along the

Cotton Belt Route in Arkansas & Texas

make headway so fast when you consider the soil and the season down there. When farmers up north are "drawing on the bank" for living expenses, Mr. Cash, and thousands of others in Arkansas and East Texas are cashing in on crops. Mr. Cash sells garden truck by April 1st; by the 15th he's marketing new potatoes, by May its strawberries and there's some crop to sell every month until Christmas. He's made five crops bringing $537 per acre in one season.

And the crops are not all truck or fruit. Corn, peanuts, clover, alfalfa, etc. yield big. Mr. Kapp, near Cash's place, makes 62 bu. of corn on his land. Mr. I. Z. Zimbrough of New Edinburg, Ark. makes 100 bu. of peanuts per acre, selling at $1 per bu. Rudy Stutter, of Stuttgart, Ark. says "I plant oats the last of September and in 15 years I've never lost a crop. Last year I threshed out 75 bu. per acre. Jacob Yoder, on the place adjoining mine made 90 bu. per acre." Near Texarkana, Tex. J. M. Champion shows how a farmer can make $1700 and $1800 a year net on twenty acres by taking advantage of the many crops per season which the long growing season allows.

Go where you will in Arkansas and East Texas you'll find farm opportunities even bigger than you've read about.

Two free books!

A farmer wrote them; and he knows what you want to know about a section new to you. They tell about the character and cost of lands, climate, crops raised, etc., and about schools, churches, towns, social conditions. Brimful of photograph pictures taken on the ground. Send me your name and address on a postal card today and get these free books now.

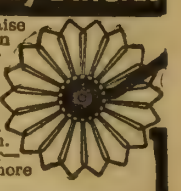
STOP Covering Corn! Use Daisy Shields

Save time and labor and raise more corn and better corn with these famous revolving shields on your cultivator. Don't waste time and effort uncovering corn—Daisy Shields absolutely prevent clods from falling on the young corn. Enable you to plow faster—plow smaller corn—kill more weeds.



Fit Any Cultivator

Daisy Shields have shanks to fit any make of cultivator and can be adjusted to meet any conditions. They revolve like a wheel—cannot gather up trash and will not get out of adjustment. The fine dirt passes right through them and covers up weeds and grass—clods are thrown AWAY from the corn.

Old Way — New Way

Investigate these shields—best ever put on a cultivator. Write for folder and send your dealer's name. We'll send a pair for your inspection.

Sell Lange's Extracts, Spices, Toilet Articles, Teas, Coffees, Remedies and Veterinary Specialties, direct from wagon to home. Long-established, well-known big line, fine profits. Steady work in a business all your own. You furnish horse or team, we supply rig on easy terms. Previous experience unnecessary—we train you in salesmanship. Make big money. Our contract beats all others. Exclusive territory near your home. Write us quick.

E. A. LANGE, CO., Dept. 3. DePere, Wis.

INSTITUTE AT POLAR.

At the Farmers' Institute at Polar, Langlade county, held January 13th and 14th, E. C. Jacobs acted as conductor. He was assisted by D. E. Bingham, of Sturgeon Bay, and County Representative F. G. Swoboda. Severe weather interfered materially with the attendance, but those who turned out were keenly interested.

Valuable information was brought out on clover silage. By request Assemblyman Ed Nordman discussed this topic. Mr. Nordman this year partly filled one of his silos with clover. The other was filled with corn. Some corn was also put on top of the clover in the second silo. At the beginning of the season Mr. Nordman started feeding the corn from the second silo. Because of favorable location near a lake, Mr. Nordman was one of the few farmers in the county to escape the destruction of the late August frosts so that his corn got fairly near to maturity before being finally nipped. Mr. Nordman noticed no change whatever in the milk flow from his cows in going from the corn to the clover. He is enthusiastic over the possibilities of clover and plans next year to grow very little corn on his farm, he figures he can grow as many tons of clover silage per acre in two cuttings as he can of corn. He also figures that the clover will not be so hard on his land as the corn and also that by growing clover he will do away with a lot of the washing which he experiences on corn land. Mr. Nordman favors a little timothy with the clover rather than having pure clover. The timothy being richer in carbohydrates helps materially in adding to the keeping qualities of the silage.

Other Langlade county farmers who this year tried clover for silage are very well satisfied with it.

Other topics discussed were the "Growing of Alfalfa," "Orchard and Small Fruits," "Barn Plans" and "Potato Growing."

WESTERN GUERNSEY MEETING.

The seventeenth annual meeting of the Western Guernsey Breeders' Association will be held at the Park Hotel, Madison, Wisconsin, February 10, 1916. Banquet will be served at the hotel at 12:30, plates $1. Business sessions will commence at 1:30 and beside the annual reports a business address will be made by W. E. Skinner, general manager of the National Dairy Show, on "Western Guernseys at the National This Year;" by Mr. W. L. Dexter, Kenosha, Wisconsin, on "The Guernsey Cow for Milk and Cream Trade," and by Mr. Will Forbes, Waterloo, Iowa, on "What the Show Ring Can Do to Develop the Guernsey Breed." As this date occurs during Farmers' Week at the University of Wisconsin and the jubilee banquet given to Dr. Babcock in honor of the twenty-fifth anniversary of the invention of the Babcock test, occurs on the evening of February 9th, we expect an unusually large number of breeders will be in attendance. All persons interested in the Guernsey breed are invited to attend and any wishing to attend the banquet will please notify the secretary in advance, Charles L. Hill, Rosendale, Wisconsin.

WISCONSIN HOLSTEIN MEETING.

The 1916 regular annual convention of Holstein-Friesian Breeders' Association of Wisconsin will be held at Watertown, Wis., on Wednesday and Thursday, March 1st-2d.

A banquet will be held on Wednesday evening at 7.30 o'clock and the regular program on the day following commencing at 10 o'clock a. m.

The local breeders and business men have pledged themselves to do all in their power to make the convention a success and will furnish the banquet on Wednesday evening free to the breeders who come to participate in it.

Arrangements for the program on March 2d are under way and this will be announced at a later time.

C. J. Schwider,
Secretary.

POTATOES BIG CASH CROP.

To the Editor:—Attention has been called to me for my activities in connection with the Lincoln county exhibit at the annual exhibition of the Wisconsin Potato Growers' Association, held at Marinette, Wisconsin, in November.

It is only in recent years that potatoes have been a big crop with us, but it is destined to be our big cash crop from now on. The acreage is increasing each year, and, what is better still, the quality of our potatoes is improving right along.

Five years ago many farmers, acting on the advice of Prof. J. G. Milward, turned their attention to standardizing the potato crop in their community. The results have been very gratifying. At the potato show held at Rhinelander in 1913, Lincoln county exhibited eleven varieties of potatoes. Every farmer exhibiting sent the variety that suited him the best. In getting together the exhibit for the Marinette show this year we could find but one kind of potatoes (Green Mountain) in sufficient quantity from which to make a selection. This means uniformity of variety at least. Now all that remains for our farmers to do is to sort closer and we shall be able to ship in car lots as fine potatoes as go into the market from any section.

As a seed-potato proposition our new soil produces stock that is clean, bright and practically free from disease. Co-operating with the Potato Growers' Association of Wisconsin and the University of Wisconsin, many of our fields have been certified by them, which enables us to offer to less fortunate sections seed that is true to type and with little or no disease.

From a county known a few years ago only as a lumber-producing section we are rapidly developing into one of the leading agricultural counties of the state.

Conditions and opportunities exist here today that make it an ideal place for a man to locate. Our land is productive and it is still cheap when compared with older farming communities. It is well watered, has good railroad facilities, good public roads, is close to the great markets and creameries and cheese factories are increasing each year. The agricultural development has just begun and if our exhibit at the Marinette Potato Show and our display of products at the state fair at Milwaukee attracted your attention where will we stand a few years hence?

Hall L. Brooks.
Lincoln Co., Wisconsin.

John Deere Implements

Van Brunt Drills and Seeders
With Adjustable Gate Force Feed

VAN Brunt Drills plant any small seed, alfalfa to bearded oats, peas or beans.

Amount sown per acre easily regulated merely by shifting feed gauge levers.

All the ground sown, because the Van Brunt adjustable gate force feed compels seed to leave hopper in even, continuous streams—no bunching or choking up—and an equal amount goes into each furrow.

An even stand of grain is secured, because pressure springs compel all the discs to cut furrows of equal depth, and the forward closed delivery places seed at bottom of these furrows.

Van Brunt Drills never clog up. Scrapers keep discs absolutely clean. The high grade discs have bearings that are guaranteed to last lifetime of drill.

Smooth running—each wheel drives half the feeds, equally distributing the work. A direct, double gear drive from the continuous axle.

Grass seeder attachment can be furnished which will drill or sow broadcast as desired.

Van Brunt Broadcast Seeders are just as positive in their operation as Van Brunt Drills.

Write us for free booklets describing Van Brunt Single or Double Disc Drills, or Broadcast Seeders.

John Deere Corn Planter
The Accurate "Natural Drop" Planter

ACCURATE—because it has the "Natural-Selection" drop—an improvement over all other methods.

Kernels do not have to be tipped on edge to enter the cells. Surface of hopper bottom and openings to seed cells are oblique, or sloping. The kernels naturally move toward and fill the cells.

A full—variable drop planter. Plants two, three or four kernels as desired—all you do to change number in the hill is to move foot lever.

Drilling distances varied, and change from hilling to drilling or back to hilling made just as easily.

All corn plates for this planter have 16 cells. Therefore, the same drilling distances are obtained with one plate as can be secured on other planters that require 8, 12 and 16 cell plates.

The gears are always in mesh and can be shifted at any time (even when in operation) to change drop or drilling distances.

Investigate the John Deere tip-over hoppers, quick detachable furrow openers, underhung reel and disc marker without rope.

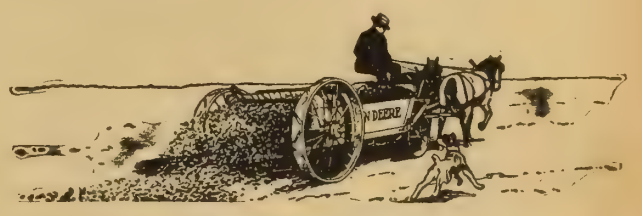
Write for free booklet, "More and Better Corn."

John Deere Disc Harrow
The Flexible Spring Pressure Disc

MODEL B—the only disc that cuts at even depth its entire width. It has a patented spring pressure lever. With this lever, pressure can be regulated at inner ends of gangs to cut out dead furrows or disc ridges without burying the harrow.

The Model "B" does not crowd toward the bottom on hillsides or in overlapping. The gangs are independent of each other and can be given the proper angle to work right under such conditions.

Write for free booklet, "Bigger Crops from Better Seed Beds."



John Deere Spreader
The Spreader with the Beater on the Axle

ONLY hip high to the top. Wheels out of way when loading. Mounting the beater on the axle is patented. Write for Spreader booklet.

Three exclusive John Deere Spreader features:

[1] Beater on the axle—nothing else like it. [1]

[2] Revolving Rake—load moving back to beater revolves the rake. Draft actually less. Even spread certain—no bunching. [2]

[3] Ball Bearing Eccentric Apron Drive—requires no attention. Performs wonders in the working of the spreader. [3]

Dain System Side Rake
The Left Hand Rake

THE tool that is revolutionizing hay making. Left hand instead of right—follows the mower closely, places hay upon clean stubble and puts it in medium size windrows with bulk of leaves inside and majority of stems outside.

This means uniform curing and leaves don't dry up and fall off. They cure in the shade.

Hay is air-cured, not sun-scorched, retains its color, nutrition, feeding value and sells for more money.

Write for free booklet describing the Dain System of Air Curing Hay.

John Deere Dealers Everywhere

Better Farm Implements and How to Use Them

BOOK FREE—168 page reference book—tells all about a complete line of farm implements and how to adjust and use many of them. A practical encyclopedia of farm implements. Worth dollars. Describes and illustrates: Plows for Light Tractors; Steel and Chilled Walking and Riding Plows; Disc Plows; Cultivators; Spring Tooth and Spike Tooth Harrows; Lister Plows and Cultivators; Disc Harrows; Alfalfa and Beet Tools; Farm and Mountain Wagons; Teaming Gears; Manure Spreaders; Inside Cup and Portable Grain Elevators; Corn Shellers; Hay Loaders, Stackers, Sweep Rakes, Mowers, Self-Dump Sulky and Side Delivery Rakes; Hay Presses; Kaffir Headers; Grain Drills and Seeders; Grain Binders; Corn Binders; Gasoline Engines. This book sent free to every one who states what special implements he is interested in and asks for Package No. X-64.

John Deere, Moline, Illinois

In and Around Wisconsin

The Ellsworth Creamery in Pierce county has installed a pasteurizing machine. This company is also now using a starter for ripening the cream.

At a recent meeting of the Dodge County Fair Association, J. E. Malone, of Beaver Dam, was elected president; Martin Lueck, of Juneau, vice president; C. W. Harvey, of Beaver Dam, secretary, and H. B. Drake, of Beaver Dam, marshal. The division superintendents of live stock for the coming year will be Wm. Berigan, Beaver Dam, horses; J. Ferguson, Waupon, cattle; Geo. Madden, Fox Lake, swine; R. B. Davison, Waupon, sheep.

The Marathon County Agricultural Society held its annual meeting at Wausau last Thursday, the election of officers resulting as follows: President, G. A. Mills; secretary, John D. Christie; treasurer, A. H. Zimmerman; superintendent of speed, G. A. Mills. The secretary of the society is to receive a salary of $500 per year and the superintendent of speed $100, the same as last year. The dates for this year's fair, as decided at the meeting, are September 5th, 6th, 7th and 8th.

A recent report of the Farmers' Creamery at Black River Falls showed the average monthly price paid for butter fat for the year 1915, 30 cents. The cost of gathering 100 pounds of butter fat averaged $1.92, and the cost of gathering 100 pounds of cream, 48 cents. Each of these items are a trifle higher than last year. The creamery received 852,459 pounds of cream as compared to 914,158 for 1914. The total number of pounds of butter fat received in 1915 was 214,925, as compared to 223,505 for 1914. The total pounds of butter manufactured was 266,283, being approximately 10,000 pounds less than in 1914. The cost of manufacturing a pound of butter, including the cost from the farm to the car was $.0327 for 1915 and $.0323 in 1914. Rufus A. Jones is secretary and James E. Dimmick treasurer.

The annual meeting of the Excelsior Creamery Company at Baraboo was held recently and T. B. Towle, secretary and manager, furnished the following interesting statistics covering the past year:

Average number patrons, 416.
Total pounds cream received, 1,992,-530.
Average per cent of butter fat in cream, 24.4.
Total pounds of butter fat in cream, 485,310.
Pounds of butter fat used in making ice cream, 3,983.
Pounds butter fat made into butter, 482,326.
Pounds butter shipped, 504,009.
Pounds butter sold to patrons, 38,545.
Pounds butter sold in town, 73,488.
Total butter made, 616,002.
Pounds overrun, 133,676.
Average price received for butter per 100 pounds, $27.90.
Average price paid for butter fat, 31.25.
Received for buttermilk, $1,171.46.
Cash value of overrun, $37,296.60.
Total cost of manufacturing butter, $11,422.52.
Cost of making 100 pounds, of butter $1.85.
Cost of gathering cream above 1 cent per pound, $4,062.79.
Overrun returned to patrons, $15,-617.69.
Total cost of hauling cream, $9,033.30.
Average cost of hauling 100 pounds butter fat, $1.86.
Cash received for ice cream, $3,682.42.
Paid for butter fat, $151,973.10.
Total butter sold, $161,756.62.
Cash on hand, $4,721.164.

The report of the business done the past year shows a very substantial increase over that of previous years. The average patronage has increased 63, or nearly 18 per cent over last year, which was also an increase of 18 per cent over the year before. The amount of butter made shows an increase of 136,000 pounds or 28 per cent more than last year. The profits from the ice cream department are about double the year before. All of this goes to show that the co-operative plan is practical and can be made a success when all of those interested work in harmony and in the true co-operative spirit.

At the farm of H. C. Rogers near Oshkosh an oil lamp used in drying chickens set fire to a large hennery, suffocating 150 birds valued at from $5 to $50 apiece. Many of these birds had taken prizes in various poultry shows. The loss was complete.

Sam S. Johns, of Montfort, Grant county, Wisconsin, topped the Chicago market a little over a week ago with a car of lambs which brought $10.75 per hundred. This is the highest price for lambs sent out of the Montfort stockyards for a number of years.

The state of Wisconsin received over $7,000,000 from the federal government for improvement of highways under the Shackelford good roads bill which passed the lower house of congress by a vote of 281 to 81. The bill appropriates $25,000,000 for federal co-operation in road building.

Judge A. J. Phillip, of West Salem, one of the leading horticulturists in the state and a frequent contributor to magazines and farm journals, celebrated his eighty-second birthday by driving a thirty-seven-year-old horse to the neighboring village of Bangor where he visited Mrs. G. W. McKenzie, who is ninety-eight years of age. Judge Phillip well remembers the last United States war with Mexico, and is hale and hearty. Last winter he deliverd an address at the Minnesota State Agricultural College on apple raising, a form of agriculture in which he is considered an expert.

The Muscoda State Bank recently held an exhibit of twenty-one separate collections of home-grown corn. Prof. R. A. Moore, of the Wisconsin College of Agriculture, had a hard time judging the exhibits but finally awarded the Muscoda State Bank cup to John Sale. Considering the poor season last year the corn was exceptionally good. In order of excellence of product and exhibit the following seven exhibitors are worthy of mention: John Sale, No. 1; Orta Cornwall, No. 2; John Miller, No. 3; Emery Miller, No. 4; Oliver Sheppard, No. 5; C. B. Haskell, No. 6, and Joe Malter, No. 7. Every exhibit at the state bank received commendatory congratulations from Professor Moore for their product, the quality of all being a surprise to him.

According to A. W. Kalbus, statistician of the state department of agriculture, there were 55,992 silos in Wisconsin on January 1, 1916, against 47,165 on January 1, 1915, an increase of 19 per cent. The contents of the silos, figuring the average size 14x28, was 4,647,336 tons. Using the average value of $3 per ton the total value of the contents was $13,942,008. Sheboygan county takes first place in the number of silos with 2,772, against 2,625 in 1915. Manitowoc county is a close second with 2,712, against 2,643 in 1915, and Waukesha county comes third, with 2,662, and 2,530 in 1915. The following table shows counties leading in the number of silos:

	Jan. 1, '16	Jan. 1, '15
Sheboygan	2,722	2,625
Manitowoc	2,712	2,643
Waukesha	2,622	2,630
Walworth	1,996	1,783
Fond du Lac	1,877	1,645
Dane	1,812	1,561
Winnebago	1,233	1,138

North central and northern counties are showing gains in silo building. Barron has 765, against 613 a year ago; Marathon 626, against 347 a year ago, and Marinette 380, against 281 one year ago. Last year Manitowoc led the counties of the state.

Mr. Allen B. West, of Rock county, is conducting a strenuous campaign in the interest of better seed corn. At a recent farmers' meeting at which this matter was taken up samples of corn grown in the vicinity of Janesville were examined. The corn was tested. It was divided into ten lots and the following is the report on each lot of ten ears:

Lot A contained only two ears in which all six kernels showed strong; two had five strong and one weak, and one had five strong and one dead. The other five kernels varied, but none were good enough for planting.

Lot B contained three ears of strong germination, two with one dead and the other five too poor for planting.

C had three strong and three with five strong and one dead.

D had one strong with nine unfit for planting.

E had four strong with one with one dead.

F had six that showed no life and had one that gave five strong kernels and one weak.

G had three strong and one with five strong, one weak and two with five strong, one weak and two with five strong and two dead.

H had three strong, one with five strong and one dead.

I had six strong.

J had six strong also, with two that had five strong and one dead, and one with five strong and one weak.

K had eight kernels testing strong, the best lot of all.

New Credit Plan on Farm Merchandise.

ON page 2 the Hartman Company, of Chicago, are offering a number of special bargains on a new farm credit plan. You can order anything mentioned there or in any of their catalogs, and the goods will be shipped without a cent of cash payment. If after thirty days' use you do not find them satisfactory you can return them at their expense without its costing you anything, as they pay the freight both ways. If you do keep them you have three months' time after receiving them before making the first payment, with the balance paid in three, six or nine months longer, making a whole year's time for payment, without any interest. You can order direct from their advertisement with perfect security or else you can secure further information and price list by filling out the coupon attached to the advertisement, asking for whatever catalogs you desire and mail it to Hartman Co., 4055-57 La Salle St., Chicago, Ill., mentioning this paper, and they will be mailed you free at once.—Adv.

A Shaft-Drive Corn Planter.

THE reason that Janesville corn planters are so simple in construction, easy to handle and easy to keep in proper repair, is because their shaft drive saves a large number of parts usually found necessary. All that is needed to keep it in light running order is to grease the shaft drive once a season and it will always be in smooth working order. Any defective parts will be replaced at once at the makers' expense. Another feature of these machines is their sight feed. All these matters are fully explained and much additional information regarding Janesville plows, harrows and cultivators given in their book which will be sent you free if you will address Janesville Machine Co., 41 Center St., Janesville, Wis., and mention their advertisement on page 6.—Adv.

An Offer to Tomato Growers.

TOMATO growers will find much of value and interest in the 1916 catalog issued by the Jung Seed Co., who specialize on this delicious fruit and have many splendid varieties to offer in their new book. To every reader of this paper sending two cents in postage for their catalog this company will send free some seeds of the Jack Rose variety, which are said to be the earliest of all tomatoes. Patrons ordering from the Jung catalog are always happily surprised at receiving extra packages of seeds free, a policy which has done much to win this company its many friends. In writing them address Jung Seed Co., Dept. 4, Randolph, Wis., and kindly refer to their advertisement on page 24.—Adv.

A Million Evergreens Backed by Guarantee.

EARL FERRIS, head of the well-known Earl Ferris Nursery, Hampton, Iowa, has been called "Iowa's Evergreen Specialist" because he has been raising evergreens and selling them to Iowa farmers in great quantities for so many years and his trees have made a record to be proud of. They make the finest kind of a windbreak or lawn decoration. He has a million on hand this year which are backed by his reliable guarantee. You will find some interesting offers in his advertisement on page 24 after reading which you can secure more information by writing Earl Ferris Nursery, 265 Bridge St., Hampton, Iowa, and referring to this paper.—Adv.

Another Use For the Tractor.

Value of the Tractor as it May Be Used in Reclaiming Marsh Lands of Wisconsin--By F. M. White, of Madison.

IN CONSIDERING the farm tractor for reclamation work we ought to know the uses to which a tractor may be put in reclaiming marsh lands. These uses are:

1. Pulling a ditching machine.
2. Pulling small willows, old logs, and stumps and removing them from the field.
3. Pulling a grub breaker and ordinary plow.
4. Pulling a heavy roller to settle peaty soils.
5. Pulling heavy disks to pulverize the ground after breaking.
6. Pumping water during flood water periods.
7. For hauling tile.

The 3,000,000 acres of marsh land in Wisconsin are one-twelfth its total land area. The reclaiming of this land will add materially to the value of our agriculture. This low land from the drainage standpoint is similar in many respects to the Kankakee marshes and to the great flat area of central Illinois. These areas are among the most valuable farming land in this county. I can remember the big floating dredges which opened up a water way through Illinois, making available thousands of acres of the most fertile land in the world. Miles and miles of ditches from thirty to fifty feet wide had to be dug through this country before one could be reasonably sure that a summer rain would not wash out an entire crop. Now the land on either side of these ditches is as valuable as land two or three miles from them. Two hundred and fifty dollars is a good price for land, but in Illinois what might have been marsh land is now selling for this price.

Here in Wisconsin much of the land is very fertile. It is close to good markets and there is no reason why its value will not be increased many times when the land is thoroughly drained.

Reclaiming land in this day of machinery is easy compared with that of ten years ago. The gas engine is a source of power which can be applied to all kinds of work and it seems to be especially adapted as an aid in land reclamation. The farm tractor is the most recent development of a mechanical power suitable for farm work and it ought under the conditions first mentioned be a very practical method of decreasing the cost of reclaiming land.

Removing the water is only the first consideration in preparing a marsh soil for cultivated crops. Many tracts of low land present difficult problems even after the water table is lowered two and a half to three feet. Muck and peat soils are very apt to be springy even if there is no danger of miring down. Wet clay soils are soft and afford very insecure footing for horses. When the surface is dry it is difficult even for a man to walk over it on account of the springy nature of the surface. When dry a peaty soil might be compared with a straw pile. Most of us have had experience tramping around on straw. It's hard work. A horse walking on marsh of this character causes the soil to tremble so that it can be felt two rods away. Working a horse under such a condition is almost cruelty to animals. Some have tried to attach marsh shoes to the horse, which does, perhaps, give him a few more square inches of bearing surface. Even with this additional foot area the horse is at a decided disadvantage. It is true the horse may become partially accustomed to using marsh shoes and when there is danger of miring he will not become excited and struggle to free himself. However, it is dangerous at best to attempt to accustom a horse to work where there is danger of miring down. The struggle and strain that a horse is likely to make may result in his serious injury. Most anyone would welcome a mechanical power that will save horses from this danger.

Tile ditching is the feasible method of removing the underground water. The disinclination of good labor to ditch on marsh lands, or, in fact, to do ditching of any kind, makes it necessary to adapt mechanical power in ditching. A tractor is specially adapted to furnishing power for pulling most any type of ditching machine. The horse ditching machines require some six to eight horses. A tractor will furnish this amount of power easily. It can be kept going throughout the working day. It will require less man power to operate the entire outfit and it ought to go on the soil where horses would be impractical.

A tractor can travel on land when it is impossible to get on it with horses and at times even with men. A tractor weighs all the way from 3,000 to 30,000 pounds. The average weight of a draft horse is about 1,600 pounds and the average weight of a man is 180 pounds. A sixty-horse-power tractor weighing 24,000 pounds and equipped with what is known as a caterpillar wheel six feet four inches long and twenty-four inches wide has a pressure of about 5 to 6.4 pounds to the square inch. The same machine equipped with a thirty-inch track would have a pressure of 4.4 pounds per square inch. A wheel machine of about the same horse power with a sixty-nine inch wheel has a pressure of about seven pounds. A caterpillar machine weighing 6,000 pounds has 1,152 square inches of traction surface. This weight machine has a pressure on the ground of 4.3 pounds to the square inch. The horse has a pressure of about ten to twelve pounds and a man has a pressure of about six pounds. The wheel tractor of about twenty-five B. H. P. weighing about 7,500 pounds and having a weight of 5,600 pounds on the rear wheels has a pressure of about 4.8 pounds per square inch. This figure is based on a fifty-six inch wheel having a twenty-inch face and equipped with an eight-inch extension rim. Without this extension the pressure is 6.4 pounds. The actual pressure of these machines is less than that exerted by the horse. The pressure as given is not the governing factor in keeping a machine on top of the ground. When the machine is pulling a heavy load the pressure exerted is materially increased. The proper lug equipment has much to do with the "toe hold" which the tractor has on the soil.

The question of the tractor being able to travel on soft ground is not necessarily the deciding factor in the use of a mechanical power. The decision should be based upon what can actually be accomplished. Pulling small willows and clearing marsh land is a considerable part of the work in preparing marsh soil for cultivation. The root system of this type of soil is very shallow, and, therefore, little trouble need be experienced in pulling the small trees and shrubs found on many marsh soils. The tractor affords a power which is steady and on which severe strain will not have a serious effect. The strain of steady, long pulls on horses is serious.

A good many tracts of land are tamarack marshes and on them we find many old logs buried in the mud and many stumps which are easily pulled. Removing these is just the job for a tractor.

The use of a tractor as a power for plowing is almost ideal. A grub plow is designed especially for plowing in tough land full of roots and covered with small shrubs. The plow is thirty inches wide, but set to turn a furrow slice of twenty-four inches leaving the rest of the share to cut under the previous furrow and cut off any remaining roots. A heavy grub breaker, depending on the size of the tractor, is sufficiently strong to cut off small willows one-half inch to three-fourths inch in diameter and turn them under. A tractor will handle one, two or three of these twenty-four inch grub breakers, depending on the size of tractor, and turn the soil over in better shape than can be done with horses. It will be practically impossible to get enough horses together to do the same amount of work. Deep tilling disk plows may be used to advantage in some peaty soils. They require lots of power and in places where the condition of the ground is suitable very satisfactorily mix the top peat with the clay subsoil. Tractor plowing in marsh land has one advantage over many of our upland soils, there are no stones and no hills.

After turning the soil a good practice would be to roll the ground by attaching to the tractor a heavy concrete roller. This settles the soil rapidly and is a decided advantage in further pulverization and preparation of the soil for the seed bed. A good roller can be a homemade affair built of concrete. Concrete will stand the wear and can be made any desired weight and is very cheap. After rolling comes the pulverization of the ground by means of heavy disk harrows especially designed for tractor work. The disks are about one-third heavier than ordinary horse disk harrows. They are built tandem and can be weighted as desired for work to be done. These engine disks may be set to run straight when it makes a good subsurface packer. A disk should not only cut the ground up thoroughly but should pulverize any willows which had been turned under by the grub breaker. Under a heavy load it will require about a twenty-horse-power tractor. These machines are built in eight and ten-feet widths.

In most of our Wisconsin drainage districts it is necessary to provide some means of rapidly removing the water during flood periods. As the tractor will not be in use performing other operations mentioned throughout the year it can be kept busy by attaching it to the pump which will be necessary to take care of the water during heavy rains. This is a cheap source of power and will eliminate the expense of an extra engine.

"I've Fed SAL-VET 5 Years"

TRADE MARK REG. U.S. PAT. OFF.

"During the five years I have been feeding SAL-VET I have not lost a single hog. Just across the fence my neighbor lost dozens from cholera. SAL-VET also keeps my horses, goats and cattle in perfect condition." William J. Damrell, Shelbina, Mo.

Right now is the time to test SAL-VET. Your animals are on dry feed. They are not getting sufficient exercise. The tendency to constipation and indigestion is greatly increased. Under these conditions the deadly stomach and intestinal worms thrive best—get in their destructive work. Let your stock have free access to SAL-VET—my great worm destroyer and live stock conditioner. It will destroy these blood-sucking, disease-breeding pests. I'll prove it before you pay—let you test it 60 days on your own stock so that you can see the good results it produces.

SAL-VET Destroys Worms—Aids Digestion—Makes Greater Gains

SAL-VET is the medicated salt which contains no Antimony. It is the greatest worm destroyer ever prepared for farm animals. Just give your stock access to it; they'll **rid themselves of worms.** It requires no dosing—no drenching—no bother at all.

Send No Money-Just the Coupon

Just fill out the coupon—tell how many heads of stock you have; I will supply you enough to last all your stock 60 days; you pay the freight charges when it arrives and feed it according to directions. If SAL-VET does not do what I claim and you make a specific report in 60 days, I'll cancel the charge; you won't owe me a penny.

SIDNEY R. FEIL, President
The Feil Mfg. Co., Chemists
Dept. 137, Cleveland, Ohio

PRICES

Ea. 40 lb. pkg.	$ 2.25
Ea. 100 lb. pkg.	5.00
Ea. 200 lb. pkg.	9.00
Ea. 300 lb. pkg.	13.00
500 lbs.	21.12

Extra discounts in larger quantities.
Dealers in the far West and South are obliged to charge a little more, on account of the extra freight charges.
No orders filled for less than 40 lbs. on this 60 days trial offer. Shipments for 60 days trial are based on 1 lb. of SAL-VET for each sheep or hog and 4 lbs. for each horse or head of cattle.

Sal-Vet is giving splendid satisfaction. Have not had a sick sheep or lamb on the farm since we began to feed SAL-VET last spring. — Oak Lawn Farm, S. F. Speerstra & Sons, Props., Whitehall, Wis.

I have found SAL-VET all you claim. My neighbor who lives within a stone's throw of my place lost several hogs from cholera, while mine are as healthy and vigorous as can be. —Andrew Ireland, De Forest, Wis.

My colts were full of worms. Some one recommended that I feed them maple ash and tobacco, which I did, but it did not interfere with the worms at all. But when I started to feed SAL-VET, they passed worms in great quantities. My colts now look 100% better and so do the older horses.—Lud Jacob Zenk, Elkhart Lake, Wis.

(244) **THE FEIL MFG. CO.**
Dept. 137-2-3-16 Cleveland, Ohio

Supply me enough SAL-VET to last my stock sixty days. I agree to pay the freight, feed it as directed, and will then pay for it if it does what you claim. If it fails and I so report specifically in 60 days, you are to cancel the charge and I will owe you nothing.

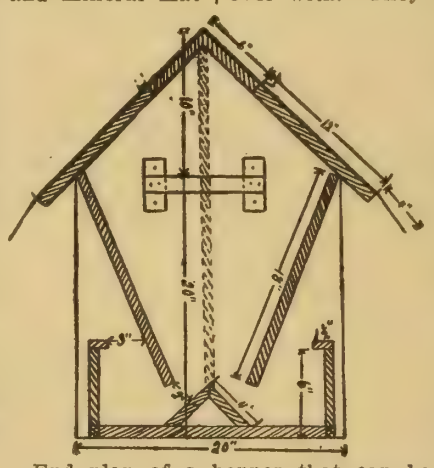
Handle Poultry For Market.

Too Many Persons Allow Their Hens to Care For Themselves and Then Expect Profits, States J. K. Morrison.

WE CAN write the balanced ration for a laying hen on a little piece of paper the size of a postage stamp and yet how many farmers of this country can tell you right off the reel a properly balanced ration to feed his hens to get eggs out of season? These are some underlying principles with which he should acquaint himself so that there will be no trouble to figure out his own ration in accordance with the home-grown feed that he happens to have.

The organs of the hen that convert protein, carbohydrates and mineral matter into albumen, yolk and shell.

All feeds that we use have protein, fats, carbohydrates and mineral matter, generally put down as ash. Some feed has more protein than others. It is possible for any farmer in the western country to raise practically all of the feed necessary to carry the flock throughout the winter and not buy any of the so-called protein feeds. There is little money in poultry keeping on boughten feeds. The pens are factories to convert feed into flesh or eggs and permit cheaper transportation on the grain and to afford a higher selling price for the grains than carrying it to market. Then again it is just carrying out the repeatedly advocated principle that all feeds should be fed on the farm in order to keep the fertility on the soil.



End plan of a hopper that can be used out of doors. By cutting figure in two you have an end plan for indoor hopper.

An old dilapidated hen that you have kept until she is dead with old age cannot convert this feed into the finished product at a profit. She should be culled out and not eat the profits of the younger hens. A Leghorn can be kept longer than the heavier breeds, as they do not take on fat so rapidly as do the heavy breeds. As a rule, two seasons is long enough to keep the American breeds. Many make the mistake of disposing of them along before Christmas and glut the market when the pig killing time is at hand and when everybody is selling off hens and chickens for Christmas money. The hens bring the best price after the spring laying season is about over with. They should then be gotten out of the way to make way for the growing stock. Eggs during the hot months from farms bring mighty poor prices and an old hen will not pay for her upkeep until fall when so many of them are carried to market. We think that the factory should be a well-matured pullet that is bred from a male bird that comes from a high laying hen. High laying is inherited from the female and transmitted by the male. The secret of breeding up the flock is the male. The factory should be hatched early and be well matured before the cold weather sets in. She will certainly not be profitable if you carry her through the first laying season and get no eggs from her. Winter laying is certainly an inherited characteristic and it makes no difference how well balanced the ration you give a hen that has not inherited this winter laying characteristic you will not make the factory turn out the eggs unless she is the laying kind. She just must be bred that way and you certainly should get some eggs this season from some breeder who is breeding for egg production and that you know has the flock that has the laying qualities.

Many breeders now throughout the country are working to breed high layers. This fact that high laying is inherited has been so popularized that many are breeding for eggs as well as for fine feathers. Get you a setting of eggs this season and even if you rear one male bird you should feel well repaid for the price you pay for the eggs.

But remember not to be too exacting about the hatch. So many complaints are registered throughout the breeding season by buyers that it is quite a trial to breeders answering the complaints. Many times it is the fault of the purchaser and he turns around and blames the person for his failure who sold the eggs. Be straight when you buy eggs and unless you have a real complaint let the matter slide.

Carbohydrates are merely the starchy part of the feed. The bird transforms the starchy part of the ration into fat, heat and energy. She also uses part of this material to manufacture the yolk of the egg which has much more carbohydrate material than protein. The protein is transformed into lean meat and muscle and when the hen is in laying condition she uses protein to make the albumen. The iron, sulphur, phosphorus and calcium which is found in plants and the mineral matter which the hens use go to make bone, egg shells and feathers. We speak in the terms of hens, for we are more especially treating of the laying hen. All of these same elements combined in different proportions are necessary for the growing chicks.

Wheat, oats, corn and kafir are the principal grains that are used in the feeding of poultry. Peas, soy beans, cottonseed meal, milk and meat scraps are the chief source of protein. The poultrymen have done much experimental work to ascertain the proper proportion to combine the protein and the carbohydrates so as to meet the demand of the growing stock and the laying hens.

The ratio that is generally accepted for the laying hen is 1:4.5. That is, a feed ration should contain one part of protein to every 4.5 parts of carbohydrates that it has. In looking at the tables which are available giving the amount of each element that the different feedstuffs contain you will find that the grains all have fat. This fat or oil is valued at two and one-fourth times as much as the carbohydrates. That is, it will go two and one-half times as far in the making of heat, energy, etc.

The growing chick needs a ratio of about 1:4. The fattening ratio is 1:7. It takes feed rich in carbohydrates to make fat. For that reason too much corn and wheat without giving some feed rich in protein will aid the hen in getting fat, but she cannot make eggs, for she is lacking in the proper material to combine with it to make eggs. The nutritive ratio of corn is about 1:8.3. This is a little too wide or contains most too much starchy material, but by combining with milk which has protein you have an excellent fattening ration.

The majority of poultrymen recommend beef scrap as the chief source of protein, but if soy beans and peas are combined with corn meal and bran, after they have been ground, in proper proportions they will make a good source of protein; then use sour milk to moisten the mash and give them plenty of it to drink you will have a very excellent ration.

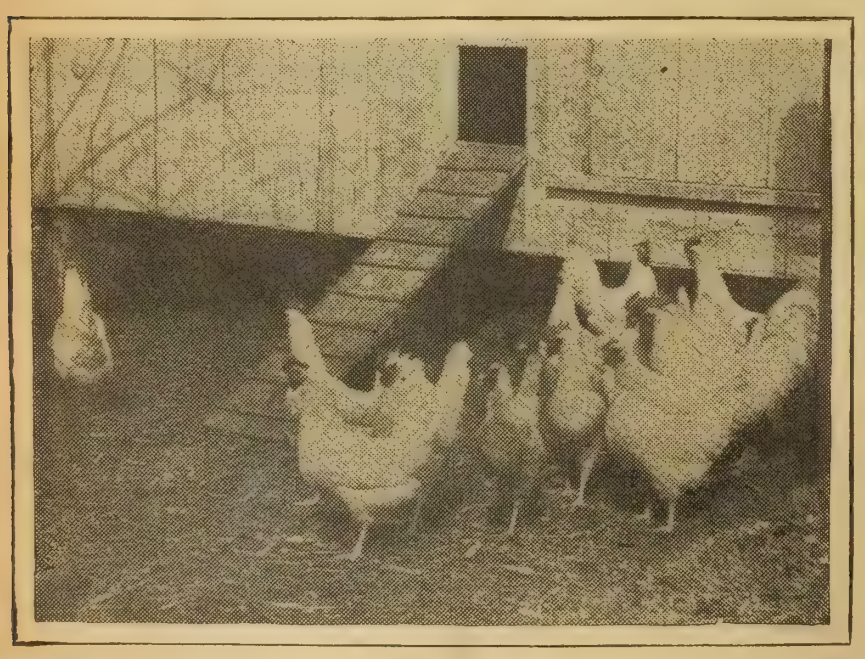
The following is the old Maine ration which is used in many sections: Wheat bran, two parts by weight; corn meal, one part; middlings, one part; gluten meal, one part; linseed meal, one part; beef scrap, one part. In lieu of the gluten meal and linseed meal you can use ground peas or soy beans and if you have plenty of milk omit the beef scrap and you will get good results. For the growing stock by using the same thing and keeping milk before them all the time you will keep them growing, for they will supplement with bugs and worms and get plenty of protein. A very simple ration is corn meal, eighteen pounds; cottonseed meal, fifteen pounds, or use about thirteen pounds of beef scrap; wheat bran thirteen pounds and four ounces of salt, or you can use soy beans or pea meal in lieu of the cottonseed meal.

Give the grain in litter about one quart to every twenty hens. They eat about twice as much grain as they do of the mash feed. The quantity of grain depends on how much grain they can pick up on the place and we have made allowance for the fact that they will pick up some.

We are too accustomed on farms to carry the frame to town and either glut the market with a low grade of stuff or it must be sent to the packing plant to be fattened. We can do this at home and sell a uniform grade of market chickens. The greatest cost is to bring the chickens to a pound or so. After you get them up to a pound they are frames with plenty of muscle that they have grown in their search for food. They will very quickly put on another pound of gain if put in a crate and fed with milk and meal.

Then when you have your birds ready for market have them uniformly crated, that is, keep all of one size together and not carry such miscellaneous stuff as we see going to the average market. A standardized product is what the public wants and farmers should learn the art of grading everything they sell without forcing it to the commission man to be graded and placed in salable shape.

Breed right, feed right and sell right and you will find that poultry will be a valuable side line on the farm.



These hens averaged over a hundred eggs each in six months time. They ate a mash composed of eleven pounds beef scrap that analyzed 70 per cent protein mixed with sixty-seven pounds corn meal. Corn and oats was the scratch ration. The main thing is to give the ration balanced. Such great variety is not necessary.

THE SURVIVAL OF THE FITTEST.

To the Editor:—Did you ever have, among your little chicks, one that was away behind the others in feathering out, that went around nearly all summer with its body bare in spots of down or feathers and its skin sunburned? Did you notice that its bill seemed longer than it should and that its head was flattened or sloped back from the bill and looked all wrong some way? Have you wondered what was the matter with the chick and why it was so different from the others when it had the same care in every particular?

Such a chick lacks vitality and it is usually an inherited weakness. It is not worth the trouble of raising and if finally it feathers and is allowed to remain in the flock it will be a positive damage, especially it if is allowed to bequeath its qualities to future generations.

Birds of low vitality and weak constitution kept in a flock are a constant menace to the other fowls, as they are predisposed to disease, which is liable to spread among them all.

At one time, in the beginning of my work in poultry, I used to select for hatching those eggs that were of good shape and size, without any regard to the hens that laid them.

I found that I got a good many undesirable chicks in this way and that as a whole the flock seemed to be growing weaker from year to year. Then I began selecting my breeding stock carefully and improvement was noticeable the first year.

Next I decided to help nature still more in her good work of letting only the fittest survive and whenever I see a weak fowl that fowl is eliminated from the flock. Of the chicks only the strong ones are kept. The weak ones are marked when they show weakness and so can be sold later if they survive. It is necessary to mark them in some way, as weak chicks may apparently overcome their weakness and later it will be impossible to tell them from the others.

If the hens were allowed to hatch and rear their chicks themselves only the strong ones would live and this is the way of nature, but we have improved on nature so much that we must go still farther and help her more.

If a hen is allowed to do as she thinks best she will leave the nest with those chicks that have been

Old Trusty Incubators

Brought Success and Profits To 650,000 Poultry Raisers

H. H. Johnson

READER, if *profits* can interest you I want you to get in touch with us. I want to tell you how and why Old Trusty has brought success and profits to so many thousands of people, and to outline to you the *Johnson Plan* of raising chickens, ducks, turkeys or geese on a *money-making* scale. I want to give you the same plans and ideas that started our customers from coast to coast doubling up their poultry incomes.

Maybe you have never given chickens much thought. Do you know that chickens can return more *actual cash* for the little attention you give them than pork, beef or mutton? On some farms Old Trusty has made the poultry *pay all the bills and more.* A mainstay income so to speak. Profits in other lines are saved—or put into the bank or into improvements or luxuries that were not possible before. Let me tell you of homes where this has worked out. But, whether you go into poultry raising for all there's in it, or just let it bring a few extra dollars now and then, it will pay you to get the Johnson plan.

Write Today for This New 136-Page Book—Full of the Ideas That Started Others Making Poultry Incomes FREE

There will be no obligation whatever. The book is free. I just want you to know what we have done in starting others, and what we can do for you too if you want to make more money than you are making now.

There's no experiment about it—no lessons to learn—no big investment made—you do not drop any of your present work—and it's not even necessary to have had previous experience, for *Old Trusty brings all the experience that's needed.* Anyone can operate it—even the most inexperienced have made big hatches with it right from the start. When you think of the fact that this incubator is used by *hundreds of thousands* more people than those who use any other, you must admit that it has made a *big success.* It leaves no doubt as to the *best* incubator. One thing about Old Trusty is that profits are *sure* if you do your part.

It can turn out record-making hatches for you at any time of the year. In coldest January or February as easy as in warm May or June.

M. M. Johnson

An Engineer and a Poultry Raiser. Inventor of Old Trusty and Founder of the Largest Incubator Business in the World.

Make Winter Hatches for Big Profits

It's the cold weather hatches that give you the big profits in chickens to sell in July and August or laying pullets in the fall and winter months when egg prices are highest. You need Old Trusty for this work. Here and there you may find an incubator that can make cold weather hatches, but remember, you are asked a high price for it. Old Trusty gives you top-notch construction at the bottom price because it's built in the largest exclusive incubator and brooder factory in the world. We make its parts in lots of tens of thousands. We have the most modern labor and cost saving equipment. We have no "big guns" drawing fat salaries and adding to our overhead cost. Therefore we are in a position to give you the biggest value for the least money. That's Old Trusty.

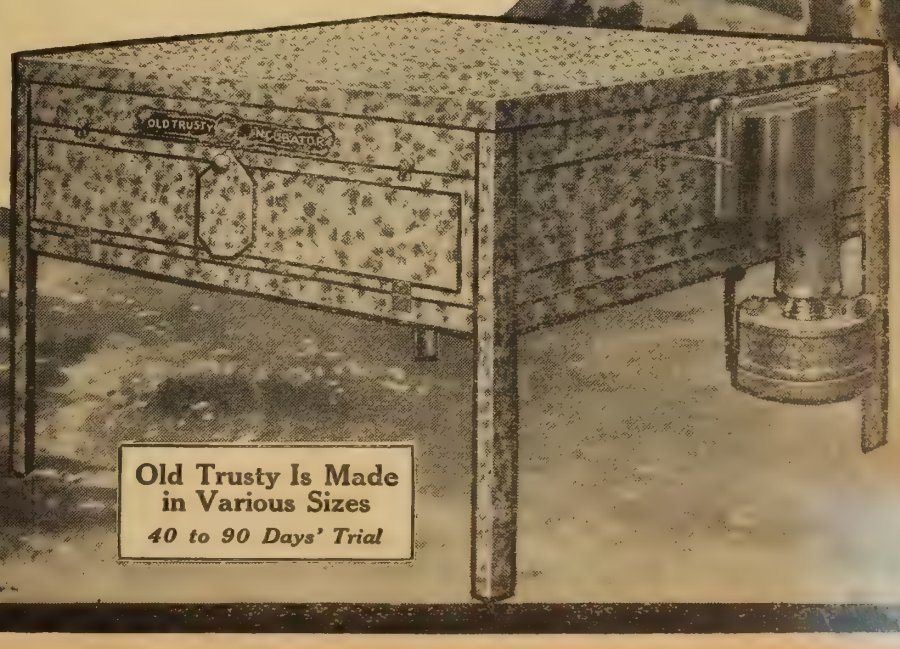
Practically speaking, there's no wear out to Old Trusty. One customer, Mr. S. W. Warren, at Tryon, Neb., bought an Old Trusty of us twelve years ago. A few weeks ago he wrote that it's still giving good service. That gives Old Trusty a pretty low cost per year, don't you think? And figuring that Old Trusty generally pays back its cost with the first hatch, what could be a better investment? But I am not going to urge you to buy an Old Trusty. What I want you to do is to send for our book and then arrange your plans accordingly. In this book we give you the facts on the raising of poultry as we found from actual experience. You'll find no fancy advertising language in it and nothing drawn from the imagination. It's just a home-made book gotten up by ourselves here in our own printing shop in Clay Center, but it's crammed full of sane *money-making* ideas from cover to cover.

Send for it today then you're in line for another income. Write your name on a postal or send a letter, as you prefer. But mail it today. Yours truly,

H. H. JOHNSON

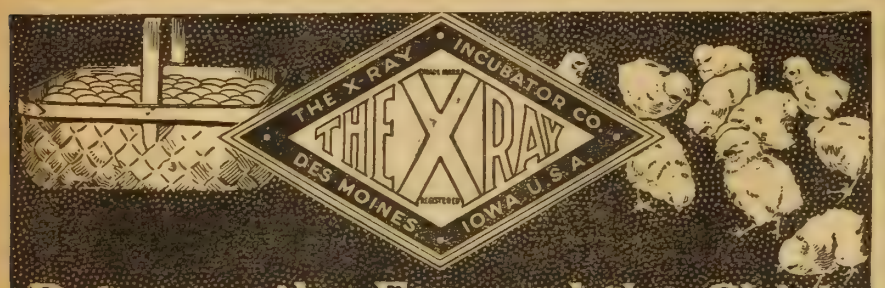
The M. M. Johnson Co., Clay Center, Neb.

Less than $10 still buys OLD TRUSTY Shipped freight paid to anywhere east of the Rockies — a trifle more to points farther west. Quick shipment from factory at Clay Center or warehouses at St. Joseph, Mo., or Seattle, Wash.



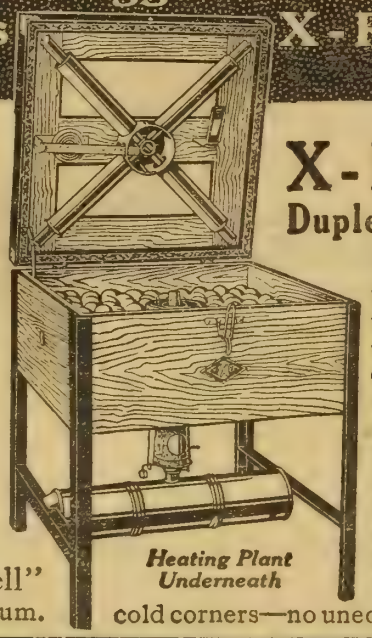
Old Trusty Is Made in Various Sizes

40 to 90 Days' Trial



Between the Egg and the Chick Stands X-Ray

X-RAY
Vapor Generator
converts the dry heat from lamp underneath into a mild, moist heat of the exact temperature and humidity for the perfect hatch. Reduces the number of "dead-in-the-shell" chicks to a minimum.



Heating Plant Underneath

X-RAY
Duplex Heater
distributes the gentle, moist heat with positive certainty and absolute equality to every point in the hatching chamber upon a perfectly level tray. No cold corners—no unequal heating.

Only One Filling of Oil to the Hatch

THINK what it means to be relieved of the disagreeable task of filling your incubator lamp every day. With the X-Ray you fill the big tank *just once*—at the beginning of the hatch. It saves oil—a gallon runs the hatch—saves work, saves worry. The

X-Ray Incubator

is the *original* incubator with heating plant in the center, underneath, where it should be. And *every year* it leads in important improvements. It is today the perfect incubator of the centrally-heated type. No other incubator is so *scientifically* built to produce perfect hatches. Reports from the many thousands of X-Ray users in all parts of the United States *positively prove this*. Join them—use an X-Ray *yourself*. Get big hatches that pay.

Send for Our Fine Free Book No. 43

Your name and address brings it. Get all the facts, illustrations and full descriptions of the X-Ray's *fifteen special features*. The book shows how the X-Ray duplex heater insures even heat and for the first time in incubator history makes practicable a *level egg tray*—how the mildly moist heat, the hatching heat of a mother hen is produced—and with it you see how the central heating principle is *correctly* applied.

Brooder has central heating plant too

Low Prices—Express Prepaid

With book, come low X-Ray prices and our new liberal offer to ship incubator *by express at our expense* to practically all points. No additional charge. We start your machine to you the very day your order is received. Wherever there is local delivery the express brings your X-Ray right to your door. It may mean an *extra hatch* to get your incubator just as soon as the express can bring it. And that means *extra profits for you.*

strong enough to make their way into the world. We help the weak ones out of the shell and impose them upon their kindred.

When a hen ranges with her brood naturally the weak ones are not able to keep up and so drop out of the race for life and the world is well rid of them. We put them up in yards and feed and pamper them and by our knowledge and care raise the weak as well as the strong.

This system continued from year to year gradually lowers the standard of vigor in the flock and results disastrously for ourselves and the fowls.

It takes a hen of strong constitution to live the strenuous life required of her these days and it does not pay to keep the weak ones, for they cannot do the work necessary to make them profitable.

It has been estimated and proven by experiments that a good hen will lay five and one-half times her own weight in eggs during the year. This tremendous production is a great strain on the health and strength of the hen and only vigorous ones can stand it.

Because of this if we keep the productiveness of our flock up to where it should be we must breed for constitutional vigor and must weed out the weak individuals whenever we find them at every stage of their growth.

Among the full-grown fowls a little attention will show you the physically weak ones. They are inactive, remain longest on the roosts in the morning and go first to roost at night, frequently being on the roost during the day. They are likely to squat instead of stand and are not found hustling for a stray grasshopper, while they sing and crow to express their joy of life. A strong hen will sing and cackle loudly and often and a strong cock will crow often.

The strength or weakness of a fowl is shown plainly in the build of the body. A strong bird will have a thick, deep, compact body, with a large fluff as compared with a weak bird of the same breed. The weaker fowls are more slender and delicately built in every line. This difference in build extends to every part of the body and a fowl of low vitality will be thin and long in every part, from its bill to its toes.

A medium or large, bright, red comb and wattles is a good sign of health and strength as is also a bright, clear, round eye, which should be prominent.

A weak fowl is apt to allow its tail to droop, while a strong fowl has a well-developed tail and carries it proudly erect. Bright-colored plumage is another good indication. A weak fowl is apt to have a faded look and the plumage will be more scanty. Lack of appetite where no disease is present is a sign of weakness.

These points of difference between strong and weak fowls hold good with chickens of all ages.

The baby chick that will later give a good account of itself will have bright prominent eyes and a plump little body. Its down will be long and thick. It will be active and sturdy and hard to catch and it will grow its feathers quicker than its weak brother or sister.

Some of the causes of low vitality and lack of physical vigor among the poultry are in-breeding, the use of pullets for breeding purposes (the pullet being herself immature and undeveloped cannot produce strong offspring), forcing for large egg yields and then for breeding purposes when weakened by the strain of heavy production, overcrowding, lack of exercise, carelessness in keeping the eggs for hatching, improper hatching and failure to select strong, vigorous fowls for breeders.

To get rid of resultant evils and secure healthy, long-lived, profit-making fowls we have to guard against these mistakes and must also ruthlessly weed out the weak individuals all along the line, from the chick that should be allowed to die in the shell to the hen that spends too much time on the roost and should be sent to market to make room for a more active fowl. Mrs. A. J. Wilder.

Mansfield, Missouri.

NEW BLOOD IN TURKEYS ESSENTIAL.

To the Editor:—My first possession was a turkey, and from that day to this I have been partial to this fowl. A trio was brought home, the first that I had ever seen, and one of the hens was for my sister, and the other was to be mine. One of them was a shiny black with keen eyes and an alert, businesslike bearing. The other was a trifle larger but of a dull, brownish black with some white feathers in the plumage. This bird, by common consent, was mine, and the other must go to the sister "because she was little," and right here could be preached a whole sermon on the subject of forever favoring one child in a family for some real or fancied reason.

Later the shiny one got sick, was choked, I think, and the sister asked if she might have "half of yours, if she dies," to which was given a very ungracious reply, I am sorry to say. For years after I was heartily ashamed of my selfishness, and only until there were kiddies of my own to keep on good terms did I really understand that in reality I was only getting even with the whole business.

At that time turkeys were not so very hard to raise, barring the ones lost by storms, low, wet places or varmints. Range was not restricted, and the turkey was more nearly in his natural environment than later. As remembered today, people were very careful to "change gobblers" each year, and while there might have been a better way, the fact remains that new blood in turkeys is the very basis of success.

A few people there are who will gravely point to the fact that in their natural state turkeys were inbred. Good and well. However, as with the Indians, all that were not capable of being warriors were either put to death or relegated to the background, and only the best and strongest were ever permitted to reproduce themselves. On no account ever attempt to inbreed or even "linebreed" your turkeys if you expect to have even the semblance of success.

A quarter of a century ago it was possible, with some success, to raise turkeys with a chicken hen, and that is largely what is the trouble with the turkey business today. This fowl cannot stand domesticity, and unless one has wide range for them better devote your time to chickens or ducks.

The best plan we have ever tried is to lay barrels on their sides in fence corners and out-of-the-way places. Cover them well with brush and branches that have leaves on them. By a little care at nesting time the hens can be rounded near the nests, and when once they lay in a nest, if one of their own eggs be left, they are pretty certain to fight for that particular spot until their brood is hatched. Indeed, only that the eggs are in danger of being destroyed by marauding dogs and crows, it would be better to not molest them in any way. Note the care the old turkey takes in the matter of covering her eggs each time. We have had hens to hide their nests out and lay during freezing weather, and hatch out a fine brood of lusty, gamey little beauties. One such brought twenty poults from twenty-one eggs.

When it nears hatching time let the hen severely alone. She does not need you—would, in fact, consider you an intruder. The only time our hatching turkeys are ever looked after is if the weather be fine, to notice that the hen does not leave the nest before the hatch is complete. She has the wild instinct, and in their natural state all wild birds hatch out within a few hours and the flock will have gone. Poor old turk! She cannot understand that years and years of coddling has put her on the domesticated list, and so she may possibly leave some pipped eggs in the nest.

The question now naturally arises: "What to do with the poults, now that they are hatched?" If the weather be warm and dry, "throw them away," meaning to let the hen mother slip away at will and feed the little creatures their natural food, in the shape of seeds, bugs, etc. Do not be concerned lest she "drags them through the grass and wears them out." She will do nothing of the sort. It often takes half a day for her to get across the small intervening lots to the fields. In a heavy rain or dew she will be found quietly hovering her babies with more sagacity than many human mothers.

But, says some one, if the weather be cold and wet when the poults hatch? Then all there is for it is to remove the poults to a pen made from

twelve-inch boards, permitting the mother turk to come and go at will. She will be always found on the job, all right. The best feed we have ever found is cottage cheese and onion tops. Not how much feed they can be stuffed with, but how little of the proper kind they can live on until they are large enough to turn on the range, which is about two weeks, or when they can no longer be restrained in the twelve-inch pen, and the sooner they get away from artificial conditions the better.

Suppose it will not do to close any turkey talk without saying something about blackhead. No need to ignore this dreadful disease, which has depleted flocks of turkeys from fifty or sixty to a few individuals, and besides not one farm in ten raises turkeys that formerly did in the eastern and middle states. Western people yet have a better outlook, and we hope the turkey will not be wholly a thing of the past, as many discerning people fear.

One breeder insists that he has cured a case of genuine blackhead by mixing equal parts of calomel and rhubarb and giving a teaspoonful in a pint of sweet milk, withholding all other feed and drink for several days. It is worth trying, but here is a suggestion that I would like to hammer hard. Be sure you mark the fowl, so that if it gets well it can be distinguished and sold on the market. Only the stock that has health, vigor and stamina should ever be used for breeding purposes. Mate about four hens to one tom, being careful that either the males or else the females are at least two years old. Subscriber.

LATE BROODING NOT ADVISABLE.

To the Editor:—In answer to the inquiry of Mrs. Glenn Healy regarding losing her chicks in the brooder late in the season, the writer has never been successful in the matter of either hatching or brooding artificially in hot weather. Early in the season the brooder will do far better than hens. Later there are wholesale losses, and the sooner we get at the bottom of it all the sooner will dissatisfaction with artificial hatching and brooding, without which the great poultry industry would be cut in half, cease.

This inquirer also asks if it is necessary to disinfect the hatcher after each hatch. It most certainly is. Cleaning and airing are all right, so far as they go, but they are not enough. Many operators say that they have splendid success the first time, and heart-breaking failure the subsequent times. It is not necessary to go into the depths of it all; far better to accept the matter as it is and get busy to remedy the evil.

After washing the incubator wash again with a 2 per cent solution of creolin added to the water. Leave the machine open until the odor evaporates, and the wooden hen is dry, leaving the lamp burning to hasten matters.

Our inquirer says that the chicks seemed bright and healthy when being placed in the brooder, and then about a dozen would be dead the following morning, and the next day would see the same losses. The writer has had exactly the same discouraging experience. The perverse little creatures would crowd, and from no apparent cause. That it was late, hot weather brooding to blame is very evident, because chicks of the same kind that were placed with a hen did fine.

We have tried this matter out from every point of view, and would certainly be glad if some of our people can give us light on the matter.

M. Stearns.

DUCK CULTURE DECREASING ON GENERAL FARM.

While the number of duck farms is increasing duck raising on the average farm as a side line is decreasing. According to bulletin 697 of the department of agriculture the decrease of duck culture by farmers is fully 40 per cent, as compared with the animal census of 1,900. Less than 8 per cent of the farms now raise ducks.

Taken as a whole, haphazard duck raising cannot come out whole as compared with chickens. The demand for duck eggs is more limited and aside from the city markets one cannot depend on a good market for ducks as for chickens. A few ducks might be kept for home use with good results, but from a commercial standpoint it would be advisable to study markets and conditions before going into the business to any great extent.

However, intensive duck culture carried on a large scale is more successful than chicken raising on an intensive scale. The Pekin, which is acknowledged the duck for all purposes, is raised almost wholly by commercial growers on a large scale. On the general farm much of the failure to realize a fairly decent profit on ducks is due to wrong methods of feed and management.

If fed rightly and grown quickly a duck will easily weigh five pounds at ten weeks of age. At least this is exactly what 100 ducklings did for us a few years since. If they had been marketed at that time with the price something like 12 cents, they would have brought a fair margin of profit. As it was they were permitted to run until near the holidays, at which time they did not weigh as much as early in the summer, sold for 6 cents per pounds or exactly what is estimated to grow a pound of duck.

On that lot of ducks we just broke even on the feed, but lost out badly on another count. The hens required to hatch and rear that many ducklings would have raised fully 100 chickens that people were pleading for at from $2 to $5 each. Even at market price the chickens would have won out over the ducks. So if you raise ducks for market bear in mind the fact that the sooner from shell to the block the better.

For best results on a general farm it is better to have a separate run for the breeding ducks. While they will thrive without water to swim in, the fact remains that they do better if furnished with running water. For this reason anyone having a pasture with a stream of water is particularly fitted to care for ducks. Failing to have a run of this kind better build a yard for them. The writer saw one of this kind just lately which contains a low shed which was bedded with straw and the inmates were happy and contented. If we mistake not there will be a flock of beautiful snowy white

"In 25 world's greatest matches Belle City won with perfect hatches"

Learn how *World's Championship Prize Winners* make their big hatching increases and big cash profits. You can do the same as easily as they do. They tell you how in my big Free Book, "*Hatching Facts*" *—their own experience in their own words—with 100 actual photographs of prize-winning hatches.* Users of my Belle City win championships *every year* in competition with users of all makes—many never used an incubator before.

But better than the 25 World's Championships is the big hatching successes and profit-paying success of hundreds of thousands of users of my Belle City in all parts of the country. 402,000 in use. In my big Free Book, "Hatching Facts," I publish, *for your information*, many letters from users in every community telling their experience—the most profitable record of poultry success you can have. Write for book. Besides the valuable pointers which winners give you, the book contains full description—all facts—proofs—particulars about

Belle City Incubators and Brooders

"An outfit made for hatching that there's no such thing as matching"

See what the 25 Times World's Champion Belle City Hatching Outfit is like

The book shows that my Belle City has everything worth having in and on an incubator—copper tank—double disc self-regulator, safety lamp, double walls and double door and dead air space all over, with roomy nursery and strong egg tray. "Tycos" thermometer, egg tester, sun hinge burner, funnel—everything you need, including valuable instruction book on operating, hatching and care of chicks. Book tells you all about my World Famous double walled top heat Belle City Brooder, guaranteed to raise largest percentage of chicks every time—a fitting companion to my World's Champion Belle City Incubator.

This is the kind of hatching outfit that has made all these wonderful Belle City records, *the very same kind of hatching outfit that I will send you* if you decide to own a Belle City and join the profit makers. But first of all see my Free Book. It costs you nothing but a postal. Write me today for book, "Hatching Facts." Jim Rohan, Pres.

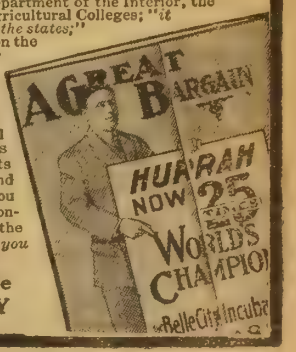
Greatest book of practical hatching information ever published

Great, big colored pictures give you an exact idea of this wonderful hatching outfit—402,000 in use—the kind used by all the Belle City World's Championship Winners; the kind used by the U. S. Government, Department of the Interior, the kind used by Agricultural Colleges; "*it incubates in all the states;*" the kind that won the gold-lined silver "Tycos" cup; the kind that will give you hatches that you will be proud of; the kind that will win big success and cash profits for you; the kind that will put you into the Championship Class from the start; will *make you cackle with joy.*



Write Me TODAY

ducklings this season and whether it pays out will all depend.

All the large commercial farms hatch with incubators. Ducks are much easier raised artificially than chickens. We have been very successful in hatching under chicken hens. The very first egg laid should not be placed for incubation. After the first few duck eggs hatch remarkably well. We have had many 100 per cent hatches, beating hens' eggs by a large margin.

If an incubator is used care should be used in following the directions. As it requires ducks much longer to escape the shell after they are pipped than chickens more moisture is required. Pekins rarely sit and at best are very indifferent mothers. Then, too, if they sit at all, it is too late to be successful. Late-hatched ducklings are of small account.

The period of hatching duck eggs is twenty-eight days, with the exception of the Muscovy, which is about thirty-five days. Give no food for at least thirty-six hours, in the meantime keeping the little fellows warm and dry.

The well-proved theory that chickens should be fed dry food does not apply to ducklings. A close observer can learn more wholesome lessons in poultry culture than all the theory expounded in 100 years. Just watch a flock of ducks when eating dry grain. They eat a short time and then watch them hie away to water for a drink with which to soften the mass. There is no way of getting around the matter. Ducks are a waterfowl and it is their nature.

They should be fed five times daily on equal parts, by measure, of rolled oats and bread crumbs, to which is added 3 per cent sharp sand.

About the third day this feed is changed to equal parts bread, rolled oats, bran and corn meal. After the seventh day three parts bran, one part each low-grade wheat flour and of corn meal, 10 per cent green feed and 5 per cent beef scrap with about 3 per cent sand or grit mixed in the ration. This mash should be mixed to a crumbly mass with water or milk. As time passes the bran should be decreased and the corn meal increased until it gradually merges into a fattening ration.

This applies to the ducklings to be sold as green ducks on an early market. For future breeders give free range and variety of feed permitting them to grow muscle and bone, the very thing we do not wish when growing for market.

HIS BIG PULLETS MAKE NEIGHBORS ENVIOUS.

To the Editor:—I hear many remarks about my big pullets and hens. Some of my neighbors seem envious and want to know why my fowls are so much larger and healthier than theirs. The secret of big hens and pullets is in the fact that I have a hardy, healthy, big breed to begin with. I never practice inbreeding, but buy new roosters every year from a neighbor who raises pure-bred stock and who follows the same plan that I do, that is, in purchasing new roosters with which to head her flock every year.

In the fall all undesirable pullets are sold and only those which come up to the requirements are kept in the spring. The eggs from the older hens are the ones used for hatching our big pullets. Of course, the care of the pullets has much to do with the size as well as the stock.

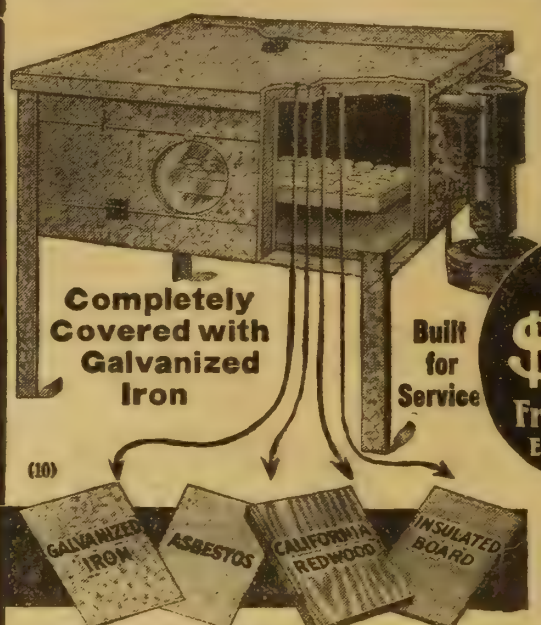
My pullets have free range where they can obtain lots of bugs, worms, etc., which is a natural diet for fowls. Besides, I think free-range fowls are much healthier than flocks kept in confinement and mature much more rapidly.

I feed my pullets after three weeks of age corn, wheat and any other grain raised on the farm and give them all the surplus milk in any form. I keep them growing from the very beginning without any setbacks. I provide them with comfortable quarters in winter and I have some that are big, bigger, biggest. S. E. M.

Ironclad TRADE MARK

Wins in the Two BIGGEST HATCHING Contests Ever Held

Why take chances with untried machines when for only $10 we guarantee to deliver safely, all freight charges paid (East of the Rockies) BOTH of these big prize winning machines fully equipped, set up ready for use? Why not own an Ironclad—the Incubator that has for two years in succession won in the GREATEST HATCHING CONTESTS EVER HELD? In the last contests conducted by the Missouri Valley Farmer and Nebraska Farm Journal, 2,000 Machines were entered, including practically every make, style and price. With 140 Egg Ironclad—the same machine we offer with Brooder, freight paid. for only $10, Mrs. C. F. Merrick, Lockney, Texas, hatched 148 chicks from 148 eggs in last contest.



We Give 30 Days Trial —Ten Years Guarantee

You have nothing to risk. We will send machines—let you use them 30 days—urge you to compare them in quality of material, hatching ability, workmanship and price—and if you don't find them satisfactory, send them back—we'll pay the freight charges and return your money. You are absolutely safe. We have to do as we advertise. If we didn't the publishers of this paper would not carry our advertising.

Both for $10 Freight Paid East of Rockies

140 EGG INCUBATOR CHICK BROODER

When an incubator is constructed of material of this kind it gives you the strongest and most durable incubator that can be made—a machine that will not warp or shrink, or open up at the seams, as every joint is lapped over with our galvanized iron covering—giving you a machine that will last a life time. Don't class this big, all-metal-covered dependable hatcher with cheaply constructed machines. Ironclads are not covered with tin or other thin metal and painted, like some do to cover up poor quality of material. Ironclads are shipped in their natural color—you can see exactly what you are getting. Don't buy any incubator until you know what it is made of. Note these Ironclad Specifications: Genuine California Redwood, triple walls, asbestos lining, galvanized iron covering. Galvanized iron legs, large egg tray, extra deep chick nursery—hot water top heat, copper tanks and boilers, self regulator, Tycos Thermometer, glass in door, complete book of directions, and many other special features fully explained in free catalog. Write for it today or order direct from this advertisement and save time.

This Book Sent FREE

It tells how Ironclads are made and why they win in the Big Hatching Contests.

AILMENTS OF YOUNG CHICKS

M. E. Dickson, Nebraska Experiment Station, Gives Practial Advice Relative to Handling Chicks.

M. E. DICKSON.

Every year the same loss occurs, and every year we have the same questions to cope with:

1. Why is it my chickens die in the shell?
2. How can I get better fertility?
3. What causes white diarrhea?
4. Chickens mope around, wings droop and the chickens die in a day or two.
5. Chicks' heads are bare, and in some cases a few individuals fail to grow any feathers except on wings—commonly found in Barred Rocks and Rhode Island Reds.
6. Chicks stand and gape, with drooped wings.
7. Chicks do not grow properly, are poor, won't eat.
8. Chicks show signs of roup.

The continual dying of chicks at different stages of incubation indicates a loss in vitality, weak germs, or improper incubation.

Weak germs are caused by such practices as breeding from immature stock, pullets with narrow chests, long crow heads, hooked beaks, and weak legs, or stock weakened by disease; overcrowding in winter quarters; damp and poorly ventilated houses; lack of exercise, and too heavy forcing for winter egg production.

Select pullets properly matured, showing good comb development, and allow four and one-half square feet of floor space for each individual. Induce birds to take exercise by feeding cracked grain morning and night in a litter. When weather permits, allow birds to run at large.

Loss in vitality is not common in farm flocks. Flocks badly in-and-in bred show a striking loss in strength of germ, followed by low fertility and finally by decreased egg production.

Improper Incubation.—If eggs are artificially hatched, many times the operator is at a loss to know wherein the trouble lies. It would be advisable under such conditions to set a hen and compare results.

No greater loss is experienced in rearing chicks from any other source than from what is commonly called "white diarrhea." This disease or trouble makes its appearance generally the first ten days. Chicks so affected show an enlarged abdomen and are pasted up behind, indicating a looseness of the bowels. Contrary to the common idea that this disease cannot be prevented, it is in most cases brought about by improper handling, such as chilling, the feeding of moldy feeds, crowding, and the use of damp litter. Avoid overfeeding of grains. This practice sometimes results in some of the grain remaining on the ground and later on becoming moldy. Where wet mashes are fed care should be taken not to make this mixture too sloppy. In case there remains any feed, always remove same from chicks, especially if the mash is mixed with milk. Sour mash should never be fed to chicks. It is a good plan to occasionally examine the litter to make sure it is not damp, where chickens are artificially brooded. Where naturally brooded do not allow the hen to drag the chicks through wet grass. Confine the hen until the ground is sufficiently dry. Chicks are very often chilled in removing from incubator to brooder. See to it that the temperature in the brooder is at least that of the incubator from which the chicks were taken. Furnish an excess of heat rather than not enough. The chicks, if too warm, will find a comfortable place. Prevent crowding by packing the corners of the brooder with litter until round. Supply abundance of litter, especially at night. This breaks floor drafts and furnishes a good insulation from the cold floor beneath. Chicks crowding under the hover at night indicate being cold. Turn up the lamp until they are comfortably spread out away from the hover five or six inches. This furnishes a reserve heat for declining temperature at night.

In early spring it is poor policy to give a hen too many chickens. By so doing the chicks are liable to be chilled, especially if they get wet. Provide a board floor in the bottom of each brood coop to protect the hen and chicks from the damp ground.

White diarrhea is of two kinds—such as the above-mentioned and also

of a pure bacillary type which is hereditary. A very few farms in this section of the country are infected with the bacillary type of this disease, and where such conditions are found it is advisable that the total flock be sold and that new stock be purchased. The soil contains the bacillus, and it is therefore dangerous to introduce new stock into the same pen. Locate the poultry house in another section of the farm.

It is a good plan to feed sour milk to the chicks as soon as possible after hatching. Some men even go so far as to deprive the chicks of water for the first two or three weeks, inducing them thereby to drink more sour milk. Sour milk is a direct regulator of the alimentary tract and undoubtedly eliminates a great deal of common diarrhea troubles. If you experience this trouble on your farm do not be frightened and think that you have a serious disease in your flock. It is more than likely in your method of caring for chicks.

Chicks moping around with wings drooped generally indicate a lack of management in brooding and is most commonly found in those artificially brooded. A hover too cold at night results in the chicks crowding. This means less sleep, and while some chicks are badly crowded and are in a sweaty condition others are badly chilled. The weakest suffer, gradually becoming weaker and weaker from night to night until they finally die. Visit the brooder at the last feeding time and see that the temperature is sufficiently high. At night make sure that the chicks have a reserve heat and that they are well spread out.

The above description may also apply to chicks being fed on grains too large for them to digest properly. Such chicks are crouched up, and were described by one man as "standing around with their hands in their pockets." A ration made up mostly of hard wheat fed to chicks is undesirable and very hard for the chicks to digest. The chicks should be hungry in the morning, and when properly brooded are able to stand considerable cold and heavy feeding.

Bareheaded chicks may be due to one or two causes—either to parasites, such as head lice, commonly found on naturally brooded chicks, or, as is sometimes the case, it seems to be natural that they grow no feathers until very late in the season. This is commonly found in Barred Rocks and Rhode Island Reds. Some individuals fail to grow any feathers except a few on the wings. This cannot be helped by feeding, and such chicks generally thrive as well as those more properly feathered. For head lice, grease the head of each chick once each week for the first four weeks with common petroleum or vaseline. Provide animal protein in the ration, either in the form of meat scrap or by feeding milk to your chicks. This will cause the more rapid growth of feathers.

Gaping chicks usually indicate a disorder in the alimentary tract. It may indicate, where chicks are brooded on low ground, the presence of gapeworms in the windpipe. These may be seen by holding the bird so that the sun will shine directly into the trachea, and may be treated most effectively by removing the chicks from the low ground. Individual cases may be treated by the use of a feather with a little turpentine on it to remove the worms from the windpipe. Occasionally roup breaks out in broods of chicks. This is only found in artificially brooded chicks, as a rule, and under conditions where dampness prevails or where the floor is not properly littered and the chicks are cold. Cement floors have been known to produce cases of roup. Provide plenty of litter, and change same sufficiently often to keep dry, and there will be no trouble from roup. It does not pay to treat the affected individuals. Rather kill and burn them up.

Poor chicks lacking in appetite generally indicate a poor ration. Use at least three grains, and feed in a cracked form; also provide a ground mixture of same, as a mash. Do not feed on bare ground. Such places become poisoned by droppings and make very undesirable feeding places. Alternate grain feeds and mash feeds, for best results in rapid growth. In feeding wet mash provide sufficient trough space for all chicks to eat at a time. Give grain feed first in the morning and last at night. Feed as large a variety as possible, and at all times allow birds access to free range and plenty of shade. Both ground feed and whole grain seem to be necessary for best growth. Ground feed mixed with milk gives more returns than the same fed dry. Dry mash fed in large rain-proof hoppers brings down labor expense. Hopper feeding is indispensable on the farm for feeding chicks eight weeks old and over. Before this, hand feeding is best. The cornfield offers an excellent place for the rearing of young stock throughout the summer. Fields from which small grains have been cut make excellent places to rear chickens cheaply.

The following is a satisfactory ration for feeding chicks:

FIRST WEEK.

After chicks have been in the brooder about thirty-six hours, it is then time to give them their first feed.

Feed in Litter.—One pound bread crumbs, one pound rolled oats, one pound corn (fine), one pound wheat (cracked).

Allow access to following mixture: Two pounds corn meal, two pounds bran, two pounds rolled oats, one pound meat scrap (sifted), one pound wheat midlings.

Every chick should have a little grit and bone with its first feed; feed in shallow trays, together with grain, five times a day until all learn to eat. Provide fresh sour milk continuously. If necessary, place an older chick in the brood to teach them to eat and drink.

SECOND WEEK.

Feed in Litter.—One pound rolled oats, one pound corn (fine), one pound wheat (cracked).

Allow access to following mixture: Two pounds corn meal, two pounds bran, one pound rolled oats, one pound meat scrap (sifted), one pound wheat middlings.

Feed sparingly on grain mixture. Aim to feed only what chicks will clean up immediately. Observe keenness of appetite. Examine litter; if grain is found, skip one or two feedings. Feed green feed, such as chopped onions, sprouted oats, etc., twice per day.

A sliced mangel, to pick at throughout the day, keeps chicks happy. Provide, when possible, a fresh piece of sod. Chicks crave certain salts found in good fresh dirt.

SECOND TO FOURTH WEEK.

Feed in Litter.—One pound corn (fine), one pound wheat (cracked).

Allow access to following mixture: Two pounds corn meal, two pounds bran, two pounds wheat middlings, two pounds meat scrap.

Substitute two grain feedings with two feedings of moist mash, alternating with grain. Moisten the above dry mash with sour milk until crumbly. Feed sparingly at first. Do not feed more than will be cleaned up readily.

FOURTH TO SIXTH WEEK.

Give three feedings of grain and two of moist mash.

SIXTH TO EIGHTH WEEK.

Give three feedings of grain and one of moist mash.

EIGHTH WEEK TO MATURITY ON RANGE

Grain and dry mash in hopper.

Provide, from start, fine grit, meat scrap, bone, dry mash, and sour milk.

Allow abundance of grass range, and shade in season.

Avoid damp litter, unwholesome feeds, lice and mites.

Avoid feeding too coarse feed when changing grain rations.

The Lay of the Chickenier.

The Pioneer has passed away,
The Buccaneer has lost his prey,
The Cavalier now pitches hay,
The Musketeer has seen his day,
The Grenadier has said his say,
The Financier is held at bay,
The Gondolier is not so gay,
The Chickenier is here to stay,
Hail to the hen and to her lay!

The Doctor said to the dry goods clerk,
"It's back to the farm for you,
Your lungs are black with the city's smoke,
And your nerves are quite worn through."
The poor chap traded his earthly goods,
His dress suit and fancy vests
For a patch of land and six plain hens
All set on their egg-lined nests.

With this humble start the chap took heart
As he worked in open air,
Ere he was known as a Chickenier
His health was in good repair.
For some weary years he toiled all day
And part of the night, I grant,
The reward for his sacrifice and grind
Was a flourishing Egg Plant.

Now when prices of fresh eggs go sky high
This Chickenier laughs in glee,
Shipping the ovals ("Fragile"—"Keep Dry")
Each day from his hennery.
His supply keeps up through all seasons,
Receipts continue to grow,
To his old-time, worn-out friends he says:
"Haven't I reason to crow?"

"My Orpingtons purchased my dwelling,
Wyandottes, my motor car,
My Cochins Buff provided the stuff
For travels in lands afar,
My Spring Campines are my silver mines,
(Nearly sterling—New York dressed)
I'm rated by Dun, I've health and fun
And a richly feathered nest.

"Cock-a-doodle-dee!
You've nothing on me,
I never shall starve or beg,
The theme for my pen
Is the Noble Hen
That lays me the Golden Egg."
—C. B. Orwig.

THE DE PERE SHOW.

There were about 500 birds entered in the De Pere show, including all classes and breeds. Practically every bird entered was a show bird of high quality. The encouraging feature of the show was the exceptional interest of the farmers. Farmers from all over the state, and some from Michigan, exhibited. The chief awards at the show have been furnished to The Wisconsin Farmer by Chas. H. Behrendt, Jr., recording and show secretary, of Green Bay, Wisconsin, and they are as follows:

Champion pen won by Mrs. H. C. Rogers, of Oshkosh, Wis., on White Rocks.

Champion cock bird won by Mrs. H. C. Rogers on White Rock cock.

Champion hen won by A. J. Shannon,

(Continued on page 22.)

There's a Reason for These PHENOMENAL HATCHES

"Have brought off two 100% hatches in my Progressive." W. H. Thomas, Oak Flat, Ark.

"Progressive Incubator hatches average close to 100%." O. P. Parrish, Rutledge, Mo.

"Every single egg hatched that had a chick in it." Roy Green, Chattanooga, Tenn.

"Four fine hatches averaged from 90% to 100%." C. A. Walker, Charleston, Ill.

PROGRESSIVE INCUBATORS bring off Blue Ribbon Hatches like these because they are built from the best materials with latest improvements. Most consistent hatchers on the market. Biggest bargains.

$7.85 LOWEST PRICE YET FOR BIG 155 EGG INCUBATOR

The Queen Gets The Chicks

We receive many letters similar to this:

"Last season I installed a Queen as an experiment. It hatched 18 per cent better than eastern made machines and 11 per cent better than any other machine made in the west. All machines were run under exactly the same conditions. I recommend the Queen to everybody inquiring which is the best, and especially to beginners." —John Bowen, Littleton, Colo., Colorado Poultry Fanciers Association.

The Queen is built to run without trouble and to outhatch other machines. Book free.

Mild Moist Heat

A Few Good Poultry Types

THE Columbian Rock Pullet shown in the double-column illustration on this page has traveled over 9,000 miles this year, having been exhibited at both the Panama-Pacific Exposition and the Madison Square Garden show in New York City. She was first pullet and champion female at the San Francisco show and first pullet at the Madison Square Garden show. Her full sister won first pullet and champion female at the Chicago show January 13-19, 1916. These birds are owned by James H. Taylor, Woodstock, Illinois, and are an excellent example of careful breeding to a good type. Other types shown on this page are also good and will be found interesting to look upon.

Farmers generally throughout the grain-belt states are beginning to realize the value of good breeding in poultry. More and more of our readers are taking an interest in the shows each year. They have become convinced that it is just as important to have good poultry breeding, if one wishes to make the most out of the poultry business, as it is to have good blood in horses, cattle, hogs and sheep. It is just as possible to have poultry "boarders" as it is to have dairy cow or hog "boarders."

A MUCH-TRAVELED CHAMPION BIRD.
This Columbian Rock Pullet is the property of James H. Taylor, of Woodstock, Illinois.

Better than 200 eggs a year, Single Comb White Orpington hen, owned by Rev. D. W. Davis, Stanley, Wis.

First Buff Plymouth Rock hen, Chicago Show, 1916. Owned by H. H. Rich, Des Moines, Iowa.

First cockerel White Leghorn, 1915 Wisconsin State Poultry Show. Owned by J. H. Durfee, Madison.

Single Comb White Orpington, a good type of this variety owned by Rev. D. W. Davis, Stahley, Wis.

First cockerel Columbian Plymouth Rock at Chicago Show. Owned by E. D. Broadt, Hellam, Pa.

Single Comb Brown Leghorn, winner at 1916 Chicago Show. This bird owned by E. A. Crotser, Fulton, Mich.

[illegible] type of White Leghorn cock[illegible] and owned by J. H. Durfee, [illegible]son, Wis.

Single Comb Rhode Island Red hen. A good type. Owned by M. C. Davis, Woodstock, Ill., who won several Chicago awards.

First Buff Wyandotte pullet, Chicago Show, 1916. Owned by John H. Saylor, Maryville, Mo.

THE DE PERE SHOW.

(Continued from page 21.)

of Appleton, Wis., on White Wyandotte.

Champion cockerel won by James A. Daley, of Mohawk, Mich., on Black Orpington.

Champion pullet won by Edw. J. R. Meyer, of Oshkosh, Wis., on Single Comb Anconas.

Cup was awarded to each of the above.

James Phinnester, Jr., De Pere, Wisconsin, won the large cup offered by C. Danen on largest number of varieties exhibited.

The show was a success in every way and enjoyed by all.

THE STANLEY SHOW.

To the Editor:—The Stanley Poultry Show was held in Stanley, Wis., January 4, 5 and 6, 1916. It was a financial success and was well attended by people from far and near. There were nearly 200 birds at the show. The Orpingtons were in the lead, followed by the Rhode Island Reds, White Wyandottes, Barred and White Rocks.

L. T. Abercrombie, of Waupaca, Wis., had the highest scoring bird at the show, a White Rock pullet scoring 94¾, and D. W. Davis, of Stanley, Wis., had the next highest scoring bird, a S. C. White Orpington hen, scoring 94½.

The following were winners of sweepstakes:

Solid Colored American Class.—L. T. Abercrombie, Waupaca, Wis., 1st, White Rocks; R. C. Buzzell, Stanley, Wis., 2d, White Wyandottes; L. T. Abercombie 3d, White Rocks; W. A. Abbott, Stanley, Wis., 4th, White Wyandottes.

Partly Colored American Class (except Rhode Island Reds)—L. T. Abercrombie 1st, Barred Rocks; Dr. F. W. Starr 2d, Barred Rocks.

Single and Rose Comb Rhode Island Reds—Ralph Keinholz, Stanley, 1st, Rose Comb Reds; W. G. Royar 2d, Rose Comb Reds.

White Leghorns—S. F. Taylor 1st.

Silver Spangled Hamburgs—Miles Welles, Waupaca, 1st.

English Class—D. W. Davis, Stanley, 1st and 3d White Orpingtons; Mrs. R. C. Rhodecker, Holcomb, Wis., 2d, Buff Orpingtons; Dr. E. F. Burns, Stanley, Wis., 4th, Single Comb White Orpingtons.

GRAND SWEEPSTAKES.

Stanley, Wis.

THE STEVENS POINT SHOW.

The Stevens Point show this year was free to the public and was run in connection with the institute. The judge was J. A. Greenwald. According to advices to The Wisconsin Farmer, he gave good satisfaction. There were nearly twice as many entries as last year and splendid interest on the part of farmers in better poultry. The weather was stormy and the day of the show was the coldest day of the year. Mr. F. J. Blood, secretary and treasurer of the Stevens Point Poultry Association, is much encouraged by the results of the show and believes that they will have a much better showing next year. The various breeds entered and the number of each were as follows:

Anconas, 2; Silver Campines, 10; Red Shuffler Games, 4; Houdans, 2; Black Langshans, 6; Single Comb Brown Leghorns, 9; Single Comb White Leghorns, 10; Single Comb Buff Leghorns, 6; Rose Comb Buff Leghorns, 5; Rose Comb Black Minorcas, 26; Single Comb Black Minorcas, 10; Single Comb Buff Orpingtons, 16; Single Comb White Orpingtons, 14; Single Comb Black Orpingtons, 2; Barred Rocks, 40; White Rocks, 3; Rose Comb Rhode Island Reds, 8; Single Comb Rhode Island Reds, 28; Redcaps, 14; Silver Laced Wyandottes, 11; Buff Wyandottes, 18; Partridge Wyandottes, 3; Columbian Wyandottes, 13.

SPROUTED OATS USED.

To the Editor:—We are Bantam breeders and have about 450 Bantams and do not feed for egg production during the winter months, as it does not pay in Bantam eggs.

We believe in the open air system of housing and we keep our birds from lice and mites by using disinfectants twice a week.

We feed our Bantams sprouted oats, cabbage and other green feed.

also use ground bone, grit and oyster shell. There is nothing better than sprouted oats in the winter, as poultry always want something green.

White Cochin hen, first prize winner last year at Manitowoc, Wis.

We make our runs so that our stock has a little work. We take hay seed, cut straw and oats screenings, mix them good and then throw them in the runs so they have something to scratch in. We always throw our feed in the so-called bedding and the chickens will have to scratch for their feed.

Our chickens always look healthy and are not bothered with any sickness. It is very seldom that we have a case of roup.

We are sending you a postal that

First prize cockerel at Sheboygan Poultry Show last year. Owned by Dachs Bros.

Tells why chicks die

Write today for the poultry expert's valuable free book, "White Diarrhoea and How to Cure It." This book contains scientific facts on White Diarrhoea and tells how to prepare a simple home solution that cures this terrible disease over night and actually raises 98 per cent of every hatch. The valuable book is free. Send your name and address for it now. E. J. REEFER, 1482 Reefer Building, Kansas City, Mo.

Farmers Like the Windbreaks.

Great Protection For Home Buildings and the Live Stock---How a Few Grain Belt Farmers Feel About It.

NOTHING adds more to the beauty of a farm home place than a fine windbreak. But the ornamental value of a windbreak is by no means its greatest importance. The real purpose of a windbreak is to protect farm buildings and live stock. The value of a windbreak for such protection has been recognized by farmers in the prairie states ever since this country was settled. There was a time when good evergreens could not be bought at a reasonable price. Those that were for sale were not properly grown. It is entirely a mistaken idea that one may go out into the pine woods of Minnesota or Wisconsin and pull up little pine trees and replant them and get a good windbreak. It can't be done, because the evergreens won't grow. A windbreak with a considerable number of scrawny and ragged trees in it is poor protection. Unless one can get evergreens which are reasonably uniform in size, which have been properly transplanted, preferably three times, and three times root pruned, there is not much chance of getting the best kind of windbreak.

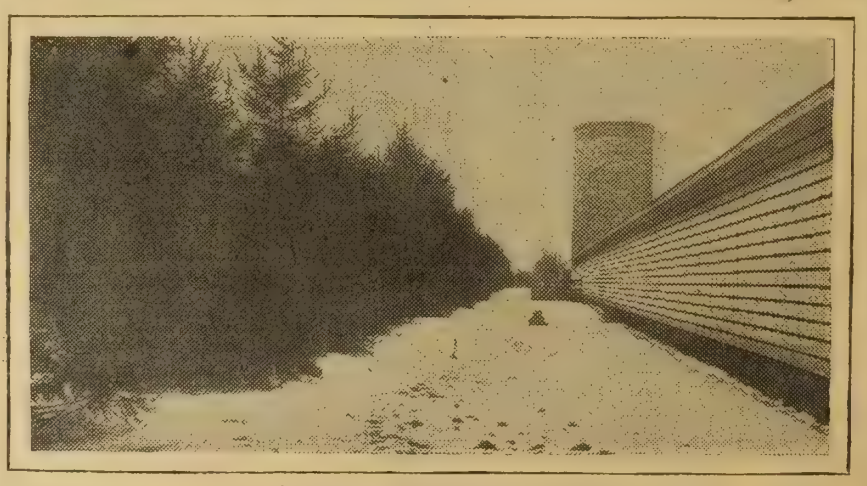
The writer recently visited several farms in Franklin county, Ia. This is one of the counties where $200 to $250 per acre farm land is no myth, and as it happens it is a county which leads in number and quality of windbreaks. On the old Mott place we saw a double row of Norway Spruce which was planted eight feet apart each way thirty-six years ago this spring. This windbreak protects a large orchard and also a good set of farm buildings and is good for a great many more years. The William Fink farm lies north of the Mott place and has over 1,000 evergreens on three sides of the set of buildings. The windbreaks are Norway Spruce and White Pine. A new Scotch Pine windbreak is growing on the northwest side. The evergreen windbreaks are taking the place of the old willows, which are dying out and which never did afford the protection which is given by the evergreens. One of the pictures shown herewith and marked as illustration No. 1 shows the new Scotch Pine windbreak supplanting the old willows, which are soon to be taken out. Mr. Fink, who appears in this picture, unlike a good many farmers, has planted his evergreens far enough away from the old willow hedge so that they will do well. His evergreens were planted six years ago last spring. It will be noted that Mr. Fink has chopped down one row of willows and he advises us that he intends to cut away the others before spring and to put in another row of evergreens, which in all probability will be Norway Spruce or American Arborvitae. The importance of planting evergreens far enough away from an old grove so they may have a chance for their life cannot be overestimated. Attention may also be called to the fact that this Scotch Pine grove has been well cultivated

NO. 1—GOOD GROWTH OF SCOTCH PINE.

This grove has a fine start. The owner selected good transplanted and root-pruned stock, put the trees some distance back from his willow hedge and fenced off the grove to keep the stock out. He also has paid attention to cultivation.

NO. 2—DOUBLE ROW NORWAY SPRUCE.

Eugene Mallory, a successful Iowa stockman, is proud of this windbreak which protects a fine set of buildings and stock which often tops the Chicago market.



NO. 3—VIEW ON MALLORY PLACE.

Showing the windbreak on the side nearest the buildings. This corncrib and brick silo contain valuable winter stores.

I Challenge The World To Beat My Quality And Meet My Low Prices On Nursery Stock

Big, New Catalog in Colors—FREE Full of Wonderful Bargains

My great new 1916 catalog of Ferris high-grade nursery stock is ready for mailing. It's free and I want you to have a copy. HEIDER MANUFACTURING CO., Carroll, Iowa

and is fenced so that stock cannot run through it. This is important to those who would grow a good windbreak. Another windbreak which is shown in illustration No. 2 was photographed on the Eugene Mallory stock farm, south and west of Hampton. This is certainly a beautiful double row of Norway Spruce. Mr. Mallory has over 1,000 evergreens similar to these on four sides of his large feed pens. He feeds ten or twelve carloads of stock every winter back of these windbreaks and effects an actual saving of feed which would pay the cost of the evergreens in a single year. Mr. Mallory has so frequently topped the Chicago market that he is pretty generally known among the stockmen of the state. He has improved several farms in Iowa and some in Minnesota and on every one he works out a practical plan of evergreen windbreaks. He has made the statement that every evergreen grove which he has ever put out at an expense of $100 has added $2,000 to the value of the farm when he came to sell it. Our readers will be interested in another view taken at the Mallory place and marked illustration No. 3. This shows the long corn shed and the new brick silo. Back of the corn shed is the Mallory feeding shed and feed lot. The feeding shed is one of the best buildings of its kind in the state. Mr. Norman Ingliss is a banker living at Hampton and he owns a farm northwest of that city. The farm was visited by the writer. The set of buildings are not yet in, with the exception of two sheds. Mr. Ingliss has started his improvements by setting out an evergreen windbreak shown in illustration No. 4. He expects to get this windbreak well established before building the house or barns. He looks upon a windbreak as an important part of farm equipment; so important that he can afford to wait a few years for it to grow strong and sturdy and become a protection for the buildings and the people and stock housed therein.

NO. 4—THINKS OF WINDBREAK FIRST.

Banker who owns this valuable farm land worth $200 per acre or better will erect fine farm buildings when his windbreak is in shape to give them proper protection. He figures that the windbreak is as important as any other farm improvements and adds greatly to the value of the land.

During the day in Franklin county several fine farms were visited and all were supplied with good windbreaks. Mr. Henry Witte, six miles northeast of Hampton, has a Scotch Pine windbreak well protected by a fence. Mr. Witte is one of the most prosperous farmers of northern Iowa. He bought land ten years ago for $85 per acre and was recently offered $265 per acre for it. He did not accept the offer. On the contrary he has so much faith in good Iowa land that he bought an additional unimproved forty for $193 per acre. Mr. Witte thinks a great deal of his Scotch Pine windbreak and expects to extend it alongside of his set of buildings. He is a feeder and very successful. On the Charles Dean farm, also several miles north of Hampton, we found the old farmhouse had been shoved back and a fine new modern dwelling is in the course of construction. The new dwelling is well protected from the north and west by evergreens. Mr. Dean is another successful northern Iowa farmer. He has been using a steam plow for a number of years and he says that is the reason his horses are so fat. Mr. Dean owns property on both sides of the road and has a windbreak on each side. When the Iowa blizzards come along they have no terrors for him.

"COLD-PACK" CANNING.

The five different methods of canning foodstuffs most commonly used may be classified as follows:

(1) The open kettle, or hot-pack method; (2) the intermittent, or fractional-sterilization method; (3) the cold-water method; (4) the cold-pack single period method; and (5) the vacuum-seal method.

The most popular method and the one recommended by specialists in charge of club work in the department is known as the "cold-pack." This simply means that the products are packed cold in their fresh and natural state in the glass jars or containers. To the fruits hot sirup is applied; to the vegetables and greens hot water and a little salt for seasoning is added. Then the sterilization is done in the jars or containers, after they are partially or entirely sealed, making it practically impossible for bacteria or spores to enter after the product has once been carefully sterilized or cooked. In following this method vegetables should first be blanched in boiling water or live steam, then quickly dipped into cold water, the skins removed and the products cut into suitable sized pieces. The products are then packed in containers and sterilized. Leaflets N. R. 23, 24, 28, 33, 34 and 37 of the department contain instructions and recipes.

By this "cold-pack" or cold-fill method of canning many food products can be successfully sterilized in a single period with but one handling of the product in and out of the processing vessel. The recipes referred to apply equally well to homemade outfits as to the several types of commercial sterilizers. Practically every type of fruit jar manufactured can be successfully handled in connection with this method.

FERTILIZER IN THE ORCHARD.

To the Editor:—Being a great friend of apples as a boy I decided to raise a big orchard when I obtained a farm of my own. It was in 1878 that I attained to that ambition. I then planted a lot of 100 trees consisting of the following varieties: Duchess, Tetofsky, Pewaukee, Fameuse, Plumb's Cider and Haas. I planted these in new broken land, but the summer being very wet I decided to cover them and consequently didn't lose a tree. But frequently if they are covered in a wet season they will root upward and if this covering is removed in any way they will die later on. To prevent this I now cover them with more ground than I intend to leave. If they need to be watered water them thoroughly and mulch them. By doing this they will pull through a very dry season.

In 1885 I lost all of the Pewaukees, the Fameuse and all but two of the Plumb's Cider. Not knowing where to receive information and being anxious to raise winter apples I planted every kind I heard of. I once went to Baraboo and saw a well-known fruit grower. From him I got many Russians. These I planted, but afterwards removed and threw away.

Top grafting was my next experience. Having a few Hibernal I sent for some Pewaukee scions. I grafted but one scion of the Pewaukee on the tree. The other scions were of other hearty winter varieties. The following winter was cold and in the spring I noticed that the Pewaukee scion was so nearly killed that it did not bud out until June. From this I concluded that only because the tree and other scions were sound and healthy the Pewaukee was saved. This continued to be the story of that variety even after it grew to be an old branch.

If I were planting a new orchard I should only plant Hibernal and top graft the first spring after planting both early and late varieties on the same tree. I should also try to put on some shy bearers. This would prevent overloading the tree, which is one of our greatest troubles. Another advantage of putting early and late varieties on the same tree is the fact that after the early apples are picked off it eases the tree and the late apples will grow much faster and generally much larger.

Another problem that confronts the fruit grower is the keeping up of fer-

Trustworthy Clover Seed

There are four things you want when you buy clover seed:—

1. High purity and freedom from foul, dangerous weed seeds.
2. Seed, nearly every one of which will grow.
3. Plumpness and good color, indicating health and vigor.
4. Hardy seed, adapted to severe climatic conditions.

Pure seed helps to keep your land clean and increases its value. When almost every seed grows, it costs less per acre than seed of low germination. Plump seed grows quickly, producing stronger, more prolific plants, thus giving a heavier hay or pasture crop. Hardy seed survives where other seed winter kills and fails. To be sure of satisfactory crops sow

NORTHRUP, KING & Co.'s SEEDS

Your assurance that these seeds are dependable is founded on the well-earned reputation enjoyed by Northrup, King & Co., for knowing the seed business and conducting it honestly. They will never permit the Sterling, Northland or Viking trade mark to be placed on any seed which does not come up to their required standard.

Sold by 15000 Dealers

In nearly every community in the Northwest there is a dealer who sells our seeds, making it easy for every planter to buy. If your merchant does not handle our complete line, he will take your order for any variety of our seed you want. Such orders will be filled without delay. If no dealer in your vicinity handles our seeds, send your order to us and it will receive prompt attention.

32nd Annual Catalogue

This is the best book we have ever issued. Whether you buy our seeds from the dealer or not, this complete, well-illustrated Seed Catalogue will help you select the seeds you need. It fully describes our clovers as well as all our other seeds for the garden, farm and lawn. A copy will be mailed you free, upon request. Write for it now.

tility. Starvation is the cause of many of our old trees dying. They are allowed to stand in June grass, which is extremely bad. The average farmer is more stingy when fertilizing his orchard than in fertilizing any other crop. Many believe it isn't needed. I have seen farmers who took such great pains in planting, but after that they might root, hog, or die.

Of late years I've made good use of the hogs in the orchard. By seeding it down with clover they were given a good feed, but unless they are at least six years old the hogs must not be in the orchard. If some young trees should happen to be in old orchards in which the hogs are allowed to roam about they should be well protected.

Fred Muehlenkamp.

INSPECTION OF FOREIGN NURSERY STOCK.

An egg mass of the very dangerous gypsy moth, discovered in a shipment of European plants to a Milwaukee greenhouse, is reported by J. G. Sanders, state entomologist, of the Wisconsin Department of Agriculture. Every shipment into Wisconsin of plants and nursery stock from foreign countries is being inspected by the state entomologist.

The gypsy moth is an exceedingly destructive pest where it has become established in portions of New England. In spite of an expensive campaign directed against it by federal and state authorities, it continues to spread in New England.

The discovery of the egg mass on the shipment to Milwaukee, through careful inspection, probably has saved Wisconsin from another destructive pest of forest, shade and ornamental trees.

Up to a period before the holidays the infected district in New England was under federal quarantine against shipment of Christmas trees and greens. For some unaccountable reason, the quarantine was lifted shortly before the holidays, and there were shipments of Christmas trees to Wisconsin and other states, where a plentiful supply was available.

"Why Christmas trees should be shipped to Wisconsin and other western states in which these trees grow is a problem to me," said Mr. Sanders today. "If the federal quarantine is not re-established against shipments of this kind from New England, Wisconsin probably will establish a quarantine against such shipments, and I think other western states will follow this example. This matter was discussed at the recent annual convention of the American Association of Official Horticultural Inspectors, which was held at Columbus, O., during the holiday week."

RURAL CONTESTS IN WASHBURN COUNTY.

J. A. Lonsdorf, superintendent of schools of Washburn county, strikes the keynote of agricultural work in the country schools in his announcement of the boys' and girls' club contests for 1916 when he says that for the future of the boys and girls it is more important than any other activity of which he is familiar. No doubt these contests throughout the state are bringing splendid results and much good work has been accomplished in Washburn county, which it will be remembered, won first prize at the state fair in 1915.

The acre corn contest will be continued in connection with the school work, and the winner will be given a free trip to the farm course at Madison. Mr. Lonsdorf's plans for 1916 include a farm record contest; home project contest; soy bean, alfalfa, ear corn, potato; home work; manual training; domestic science; general school exhibit at county fair and plain and fancy work sewing contests. The farm record contests consist of poultry record, expenses for each month and value of eggs and profit and loss for each month. Daily record of eggs laid included; records for feed expense and value of pig, dairy cow or dairy herd, or any other farm domestic animal raised for profit. Records of the expenditure and receipts of a farm, say, the parent's farm; record of work and fertilizer put on field and the yield showing profit; make comparison with other fields and crops; milk sheets; feed records, showing profit or loss for dairy cow or cows. Keep daily records. Use Manila cardboard and rule it carefully.

In the home project contests the contestant will take care of, feed and have charge of pig or calf or sheep or colt. This animal should have been presented to the contestant by parent. Contestant will bring the animal to county fair; parent and teacher will certify. Best pig, 1st, $2; 2d, $1; 3d, 50c and 4th, 25c prizes. The same prizes are offered for the best heifer, sheep or colt. Any school club can receive the same prizes as are offered to the individuals. Clubs may take care of, feed, have charge of same kinds of domestic animals and bring same to county fair.

In the ear corn, soy bean and like contests the prizes will be for the best exhibits at the county fair, the first prize in each class being $2 with $1 for second, 50c for third and four 25-cent prizes. In the contest activities similar prizes will be awarded.

Mr. Lonsdorf also outlines the plan for organized school children's clubs. He has suggested the following constitution for these clubs, and as they can be started in any county we are giving the outline for the guidance of teachers or others who would like to take up such work.

Each school shall have an organization known as the —— School Children's Club.

The officers of such club shall be a president, vice president, secretary, treasurer and the teacher as adviser.

All acts by local clubs must be approved by the adviser.

The membership qualifications shall be: Pupil of school attending regularly and good in deportment. Adviser may disqualify any member for misbehavior or other good reasons.

Young people of district may become honorary members.

Membership shall be free unless assessments are voted.

The Washburn county school children's club shall be composed of all the local club members.

Each local club shall elect one delegate to the annual meeting of the county club.

These delegates shall meet at the direction of the county superintendent presently at the time of the county graduation.

These delegates shall proceed to elect the same kind of officers as are needed for the local club.

At the county meeting other important matters may be voted on.

The secretary of the county club shall report to the state secretary of boys' and girls' clubs if there is one. He shall also report to the state organizer of clubs.

All acts of the county clubs shall be subject to the approval of the teachers in institute assembled.

The activities of the local clubs shall consist among others of the following:

Agricultural contest work in soy beans, alfalfa, corn, potatoes.

Home projects like raising of pig, calf, flock of hens, etc.

The department of agriculture's annual estimate of farm cattle in the country January 1st shows 21,988,000 milk cows, an increase of 3.4 per cent over 1915; 39,453,000 other cattle, an increase of 6.4 per cent; 49,162,000 sheep, decrease of 1.6 per cent, and 68,047,000 swine, an increase of 5.3 per cent.

WASHINGTON'S CAPITAL GETS NEEDED OUTLET.

Olympia, the capital of the state of Washington, has now, for the first time in its history, adequate railroad connection with the rest of the state, with other Pacific coast states and the East.

This has been effected through a branch which now connects Olympia with the main line of the Union Pacific system from Portland to Seattle. Train schedules on the new line provide connection with several of the through trains, both northbound and southbound, including the famous Shasta limited.

A fine station has been provided in Olympia, conveniently located near the business district and thoroughly up-to-date in equipment. Olympia will now have a better opportunity to develop as a city—not merely as a capital.

The new train service has been in effect since January 1st.—Adv.

136-Page 1916 Poultry Book Ready for the Mails.

HERE'S to The Wisconsin Farmer readers who are interested in poultry facts—and that should include one or two members of every rural family. The chicken flocks of the farms must supply the poultry demands of our country. There are not enough strictly poultry farms to supply even one of our largest cities without the help of the eggs and poultry shipped from the farm homes. This book is unlike a lot of other poultry books—it is free—and it is also well illustrated. There are pictures of farm poultry flocks from almost every corner of our country.
